bubbled through one The phaseboundary potentials were then determined in the oil-cell The original 25 mv was retained with CO_2 (pH 5.3) but the solution not treated with CO_2 (pH 7.9) had a potential of 15 mv negativity In another experiment 1 mg % methacholine with 30 mg % bicarbonate (pH 8.3) gave 10 mv negativity which was retained 5 hours in the presence of dog brain and CO_2 (pH 7.1) but reduced to zero by brain not treated with CO_2 (pH 7.8) In another run 17 mg % methacholine with 25 mg % bicarbonate in equal parts Locke solution and saline (pH 8.1) gave 40 mv negativity which was retained 4 hours in the presence of cat brain and CO_2 (pH 5.3) but reduced to 30 mv negativity by brain not treated with CO_2 (pH 8.1) The data may explain the slowing of the EEG in the acapnia of hyperventilation and the effects of CO_2 therapy in other conditions

Method of sensitizing guinea pigs to horse serum that yields after challenging of animals a 100% lethal response

WALTER E BARRETT (introduced by B N CRAVER) *Research Dept, Division of Macrobiology, Ciba Pharmaceutical Products, Inc, Summit, N J*

The problem of assaying the value of drugs in protecting guinea pigs from anaphylactic shock is rendered somewhat simpler if a method of sensitization be available that invariably leads to such a high titer of antibodies that a later injection of a shocking dose of the antigen, given after a suitable interval, always proves fatal Such a method is admittedly open to the objection that without immunological tests one does not know how much more than a surely fatal dose of antibody is present in each animal A possible second objection is that animals so sensitized might not be suitable for revealing the protective effect of a drug of low potency This second objection seem inapplicable to the antihistaminics, and the first objection can be met by employing in each test of an unknown drug a compound of known activity The method that realized the goal sought was the intra-hepatic injection of 2 doses of 0.05 ml of horse serum They were injected at the same time but in different places The results with other methods, including the use of adjuvants and vehicles (cf FREUND, F AND K McDERMOTT *Proc Soc Exper Biol & Med* 49 548, 1942), will be presented Wide variations in dosage and in routes of administration failed to accomplish what the intrahepatic method achieved The comparative anti-anaphylactic activities of Pyribenzamine and Antistine as determined by this method will be presented

Studies with gitalin (amorphous) for treatment of patients with congestive heart failure

R C BATTERMAN, A C DEGRAFF, L B GUTNER,*

O A ROSE,* AND J HOWE* *Dept of Therapeutics, New York Univ College of Medicine, New York City*

Studies with amorphous gitalin (mixture of glycosides obtained from the aqueous extract of *digitalis purpurea*), indicate that the preparation possesses advantages over other cardiac glycosides. The therapeutic ratio (therapeutic dose/toxic dose) obtained by multiple dose digitalization reveals an index of 36.9 as compared with 66.5, 58.0 and 60.6 for digitalis leaf, digitoxin and digoxin, respectively. The therapeutic range as determined by the percentage of patients presenting toxicity by doubling the minimal maintenance dose was 43.4. This greater range for amorphous gitalin as compared to digitalis leaf was demonstrated in 18 patients receiving both preparations for either maintenance or toxicity. For digitalis leaf, the percentage of patients who became toxic upon doubling the maintenance dose was 66.6, while that for gitalin was 33.3. Calculation of anticipated toxic dose of digitalis leaf on the basis of equivalent maintenance doses for gitalin and digitalis leaf indicates a 40.4% increase in therapeutic range for gitalin. Patients manifesting toxicity to digitalis leaf may take an equivalent dose of gitalin without toxicity. Digitalization was attained with ease. Maintenance was satisfactory and predictable. Dissipation was not as slow as digitoxin but not as rapid as digoxin. Toxicity although similar in type and incidence to other glycosides was less severe than digitoxin. On the basis of therapeutic range, predictability of dosage, and dissipation, amorphous gitalin is the digitalis preparation of choice for the usual treatment of the patient with congestive heart failure.

Acute toxicity of veriloid for some laboratory animals ROBERT O BAUER,* GEORGE L MAISON AND J W STUTZMAN *Dept of Pharmacology, Boston Univ School of Medicine, Boston, Mass*

The acute toxicity of Veriloid (J W Dart Labs' purified, reproducible extract of *Veratrum viride*) was tested in albino mice, rabbits of mixed sex and male Wistar rats. The LD₅₀ data are summarized in the following table:

	LD ₅₀	CONFIDENCE LIMITS (P = 0.05)	ROUTE
63 Rabbits	18.7	15.4-22.6	Oral
291 Rats	12.2	10.9-13.8	Oral
40 Mice	3.2	2.5-3.9	I.P.

The I.P. LD₅₀ value of Veratrone (Parke, Davis and Company) in albino mice—2.45 (1.8-3.2) mg/kg—when compared with the LD₅₀ value of Veriloid by the same route in the same species gave a po-

tency ratio of 1.26 (Veriloid/Veratrone). The 19/20 confidence limits of 0.9 to 1.76 indicate no statistically significant difference between the two LD₅₀ values. Rats and mice poisoned with Veriloid die within 2 hours regardless of route of administration. In the rabbit death may occur up to 24 hours with an average of 2-3 hours. Death is preceded by a series of predictable events. Within 5-8 minutes after administration of a toxic dose of Veriloid there is severe retching and profuse salivation. The hyperirritability that follows the retching usually leads to clonic convulsions. An occasional animal died without convulsing. Gross pathologic examination reveals only hyperemic adrenals.

Studies with low vapor concentrations of carbon tetrachloride labeled with carbon fourteen II Absorption and elimination upon skin exposure of monkeys W H BEAMER, D D MCCOLLISTER, G J ATCHISON AND H C SPENCER (introduced by D D IRISH) *Biochemical Research Lab and Spectroscopy Lab, Dow Chemical Co, Midland, Mich*

Monkeys received skin exposures to 1150 ppm (7.24 mg/l) radioactive carbon tetrachloride for 270 minutes and to 485 ppm (3.06 mg/l) for 240 minutes. Precautions were taken to prevent inhalation of the radioactive vapors. At the end of the 1150 ppm exposure, the monkey blood contained carbon-14 activity equivalent to 0.30 mg CCl₄/l of blood and the expired air contained activity representing 0.003 mg CCl₄/l of air. Complete elimination of radioactive material from the monkey body was rapid. Carbon-14 activity was not measurable in the blood after 48 hours nor in expired air after 5 days. The results from the skin exposure to 485 ppm were of a similar, but proportionately lower, order. Radioactivity was not measurable in blood 24 hours after exposure nor after 2 days in expired air. After the 270 minute skin exposure to 1150 ppm, the carbon-14 concentration of the monkey blood was equivalent to that reached in 24 minutes during the inhalation of 46 ppm radioactive carbon tetrachloride. Similarly, the blood concentration reached in the 240 minute skin exposure to 485 ppm was equal to 10 minutes of the inhalation of 46 ppm. Thus, skin exposures to vapor concentrations up to 1150 ppm carbon tetrachloride do not appear to constitute an industrial health problem.

Measurement of pathological pain in distinction to experimental pain HENRY K BEECHER, ARTHUR S KEATS* AND FREDERICK C MOSTELLER* *Anesthesia Lab of Harvard Med School at Massachusetts General Hospital, Boston, and Dept of Social Relations, Harvard Univ, Cambridge, Mass*

This report is a further development of the

method employed by Denton and Beecher for the study of pain relief by analgesics. The 978 subjects employed in elaborating this method over the last 3 years were postoperative patients in pain. Six members of the methadone series, morphine, pentobarbital sodium and saline have been used in developing the method and all were administered as unknowns both to the observers and to the patients. The order of administration of drugs was randomized according to sound statistical practice. The minimum number of patients (about 25) necessary for the determination of analgesic potency as well as the upper and lower limits of analgesic activity have been established. Saline has provided the lower and morphine sulfate 10 mg/150 lbs body weight, the upper since exceeding this dose does not give increased frequency of relief in routine trials. The use of morphine itself as an unknown gives an extraordinarily good check on the method. The accumulative data show that a variation in sensitivity to analgesic effects of morphine exists among patients, and the distribution of this variation is approximately normal. This observation provided the basis for a mathematical model which would provide a single or point estimate of the proportion of patients helped by a drug, when more than one drug was administered to the same patient. This model enabled us to eliminate some difficulties in our experimental design. From selected portions of the data, curves have been constructed relating the probability of being helped to the difficulty of being helped.

Pharmacological properties of 2,2-diethyl-1,3-propanediol (DEP) F M BERGER, B J LUDWIG* AND C RUSSO * *Wallace Labs, Inc, New Brunswick, N J*

DEP was prepared by the reaction of 2 ethylbutyraldehyde and formaldehyde in alcoholic potassium hydroxide solution. This substance is a white crystalline compound melting at 62°C, readily soluble in most organic solvents and soluble in water to the extent of 10% at 25°C. The toxicity of DEP is very low by all routes of administration. After large doses, DEP causes loss of the righting reflex and induces paralysis. Paralysis is preceded by excitation suggesting that the compound affects higher levels of the central nervous system than mephenesin. The anticonvulsant activity of DEP was evaluated according to the timed intravenous infusion method of Orloff *et al* (*Proc Soc Exper Biol & Med* 70:254, 1949). After intraperitoneal administration of DEP in doses of 200 mg/kg ($\frac{1}{2}$ of the mean paralyzing dose), metrazol in doses of 250 mg/kg can be injected i.v. without producing persistent convulsions. DEP also elevates the threshold to convulsions produced by strychnine and by picro-

toxin. It possesses stronger anticonvulsant properties than trimethadione and mephenesin. DEP is well absorbed, even after oral administration. It is rapidly inactivated in the body and has only a short duration of action. The lack of effect of DEP on multineuronal reflexes is rather interesting in view of its strong antagonistic action to strychnine.

Electrical action of glyketal R BEUTNER *Keeley Inst, Dwight, Ill*

Like mephenesin (tolserol, myanesin), glyketal relaxes skeletal muscle by depression of multi-neuron reflexes and crossed extensor reflexes (F M BERGER, 1949). When injecting this new drug in the lymph sac of frogs, it was found to diminish the electrical activity of the brain, also that of muscles and the heart. Diminution of brain activity by tolserol has previously been reported by Spiegel and Wycin in humans, being most pronounced in the electrical activity of the hypothalamus. Glyketal, like tolserol, produces a general lowering of the potential of the EEG and of the voltage of currents, the rate declined, in some cases to 3/sec. This diminution of EEG activity may be another factor in the quieting action of these drugs in tension states, alcoholism, muscle spasm etc.

'Benemid' (p-(di-n-propylsulfamyl)-benzoic acid)
—An anticatabolite its pharmacological properties. KARL H BEYER, VIRGIL D WIEBELHAUS,* HORACE F RUSSO,* HAROLD M PECK* AND SAMUEL E MCKINNEY * *Dept of Pharmacology, Med Research Division, Sharp & Dohme, Inc, Glenolden, Pa*

A principal mode of inactivation of a number of essential or therapeutically useful organic acids, such as p-aminobenzoic acid (PAB), salicylic acid, acetylsalicylic acid or p-aminosalicylic acid (PAS), is by conjugation with glycine to form the corresponding amides. In general, these amides are inactive therapeutically, and are eliminated rapidly by the kidneys. It has been found that 'Benemid' (p-(di-n-propylsulfamyl)-benzoic acid) and related compounds decrease the destruction of such organic acids by inhibiting their conjugation. In this sense, the agent may be thought to function as an anticatabolite. Since it permits a greater physiological economy of the therapeutic agent by inhibiting its inactivation or elimination, various uses for the agent are being explored in antibiotic chemotherapy, PAS therapy of tuberculosis, salicylate therapy of rheumatic fever and in the field of steroid physiological chemistry. 'Benemid' is absorbed rapidly following its oral administration to laboratory animals and to man. Following a single oral dose of the drug, a determinable and functionally useful plasma concentration persists in the dog for over

44 hours The compound *per se* is excreted so slowly that its renal clearance cannot be estimated, there being little or no drug in the urine It is metabolized very slowly and its metabolic products may be estimated in the urine The drug appears to be well tolerated by man and animals and is essentially non-toxic at useful dosages

Observations on effects of procaine, and diethylaminoethanol upon hemoglobin D D BONNYCASTLE, JOSEPH M WHITE* AND CARL S HELLIJAS* *Dept of Pharmacology and Toxicology, Yale School of Medicine, New Haven, Conn, and Dept of Anesthesiology, Hartford Hospital, Hartford, Conn*

It has been observed by one of us in some clinical cases receiving intravenous procaine, that cyanosis occurred in the nail beds, and that the blood, arterial and venous, oozing from the operative site appeared darker than normal, this was in spite of adequate ventilation with 100% oxygen This change in blood has been reproduced experimentally in the dog *in vivo* and in dog blood tested *in vitro* The hydrolytic products of procaine have been examined for this action and diethylaminoethyl alcohol alone was found to produce the change Studies in the dog upon the production of this change and its physiological importance, with respect to gaseous exchange, have been carried out These studies indicate that the color change is due to a modification of the hemoglobin, which change, when marked, results in a reduced oxygen carrying capacity of the hemoglobin Some observations have also been made upon blood samples obtained from humans receiving large quantities of procaine intravenously Attempts have been made to determine the mechanism of this change as well as the nature of the altered hemoglobin

Bromsulfonphthalein as a tool for study of liver physiology R W BRAUER, J S KREBS* AND R L PESSOTTI* *Dept of Pharmacology and Radiobiology, Louisiana State University School of Medicine, New Orleans*

Bromsulfonphthalein (BSP) uptake from the blood stream in dogs has been studied by means of the continuous infusion technique A steady level of blood and bile BSP can be attained by this means Dye extraction at infusion rates of 0.2 mg/kg/min or less occurs at a constant rate near 12% of circulating dye per minute With further increase of infusion rate a rapid decrease of extraction efficiency is observed Bile collection during such infusion has shown 1) that colorimetrically determined BSP concentrations of 1000 mg % represent the limit attainable in the dog 2) That colorimetric BSP excretion occurs at rates from 30 to 70% of the infusion rates Analysis of the

livers in such experiments shows that while some BSP accumulation occurs in that organ, a considerable amount of BSP remains unaccounted for Using S^{35} tagged BSP under similar conditions nearly quantitative recovery of S^{35} infused can be made from liver, blood and bile Chromatographic analysis of bile BSP shows that the S^{35} activity can be recovered in 4 fractions, different from BSP, none of which are colorless Quantitative relations among these components will be discussed in relation to infusion rates, and to conditions modifying biliary BSP excretion such as liver injury or bile stasis The significance of these findings in connection with the basic mechanism involved in BSP excretion and their bearing on the question of extrahepatic BSP uptake are considered

Protective action of sodium catechol disulphonate in acute poisoning by compounds of vanadium and cobalt H A BRAUN AND L M LUSKY* *Division of Pharmacology, Food and Drug Administration, Federal Security Agency, Washington, D C*

Disodium catechol disulphonate (DCD) injected intramuscularly in aqueous solution proved effective in the treatment of acute poisoning by ammonium metavanadate in rabbits, rats and pigeons In animals treated with DCD the fatal dose of the vanadate was about twice that of the untreated animals Treatment must be prompt, i.e. within 3 minutes However, if either sodium bicarbonate or citrate was injected simultaneously with the DCD, treatment might be delayed up to one hour Sodium succinate had no such effect The intraperitoneal LD_{50} of DCD for the rat was 3.75 gm/kg DCD appeared in the urine in from 30-45 minutes and continued to be excreted for about 2 hours Since rats injected intramuscularly with the fatal dose of cobalt sulfate survived for about 15 minutes, prophylactic treatment with DCD was resorted to Animals treated with DCD 30 minutes previous to the injection of cobalt sulfate survived otherwise fatal doses of this salt DCD was ineffective in poisoning by compounds of selenium, thallium and mercury

Some effects of procaine and diethylaminoethanol on the auricle and ratio of ventricular rate to auricular rate in the dog BARBARA BROWN, (introduced by G H ACHESON) *Pharmacology Dept, University of Cincinnati College of Medicine, Cincinnati, Ohio*

In dogs under dial-urethane anesthesia with chest open and artificial respiration, the right auricle was driven by electrical stimuli at varying rates (from 170/min up) Auricular electrograms and ECG's were recorded Before and after vagotomy the auricle responds regularly to stimuli up to 480-620 per min, the threshold increasing as frequency rises Intravenous procaine (8 mg/kg)

and diethylaminoethanol (32 mg/kg) decrease the maximal rate which the auricle will follow to 330-540 per min (8-33%). Diethylaminoethanol increases the threshold at rates of stimulation down to the lowest rate studied whereas procaine does not change the threshold in the lower range of frequencies. Both compounds decrease auricular conduction velocity. In this preparation, before and after vagotomy, the ratio of ventricular rate to auricular rate (V/A ratio) remains 1.0 up to auricular rates of 280-360 per min and reaches 0.5 or less at 420-550 per min. Procaine increases this ratio when it is less than 1.0 and usually shortens the P-R interval, whereas diethylaminoethanol decreases the ratio and usually lengthens P-R interval. The marked decrease of V/A ratio produced by vagal stimulation or by intravenous acetylcholine (0.08-0.12 mg/kg) was more effectively prevented by procaine than by diethylaminoethanol.

Effect of BAL on distribution of intravenously administered zinc using Zn^{65} H. D. BRUNER
Dept. of Pharmacology, Univ. of North Carolina, Chapel Hill, and Med. Division, Oak Ridge Inst. of Nuclear Studies, Oak Ridge, Tenn.

In studies on the toxicity of intravenously administered $ZnCl_2$ (1% sol., pH 6.1, L.D. 60-90 = 0.22 mm/kg) it was observed that 2 mol equivalents of BAL in propylene glycol given before or with the zinc completely eliminated the acute toxicity, but did not prevent the delayed death 72 to 96 hours later. In fact, BAL seemed to accentuate the renal damage, the chief cause of death. Subsequently, the distribution of zinc has been studied 72 to 96 hours after a single intravenous injection using Zn^{65} for tracing. Twelve rats received approximately 0.012 mm/kg of Zn^{65} intravenously of which 4 received simultaneously 50 mol equivalents of BAL in peanut oil and two got 62 mol equivalents spaced at 0, 24, and 48 hours. Four additional rats received 0.02 mm/kg of Zn^{65} plus 0.165 mm/kg of stable Zn, enough to give severe renal damage, two of the four received 3.3 mol equivalents of BAL intramuscularly at the time of the zinc. Control and treated pairs of animals were viviperfused 75 to 92 hours later, and tissues and separated excreta counted after pseudo-wet ashing with HNO_3 . In the control rats 31-42% of the zinc was excreted via the feces with 4% or less appearing chiefly on the first day. After BAL, urinary excretion increased up to 20 times and fecal excretion decreased. The red cell content of Zn^{65} doubled in the BAL rats. The content in 17 other organs and tissues examined, particularly the kidneys, was not affected by BAL. The high dose of zinc roughly doubled the amount in the kidney, but otherwise the data do not support the pathological interpretation.

Considerable tolerance of excitability of excised muscle to drastic changes in electrolyte concentration of immersion fluid E. H. BRUNQUIST AND J. B. HENDERSON (introduced by RICHARD W. WHITEHEAD) *Dept. of Physiology and Pharmacology, Univ. of Colorado School of Medicine, Denver*

Paired sartorius muscles (frog) were maintained in an extended condition, under a slight amount of tension, in test tubes containing 20 to 25 cc of immersate. One series of such preparations was maintained at 13° C during the survival of excitability, another series was kept at 25° C. Periodic determinations of the threshold to faradic stimulation were the criteria of alterations in excitability. Survival in conventional Ringer's fluid was compared on the one hand with survival in the same fluid diluted to varying extents with distilled water, or, on the other hand, with survival in Ringer's fluid modified by added amounts of NaCl or of all of the salts of Ringer's fluid. Dilution of Ringer's fluid to half strength did not reduce the average survival time, but a doubling of the concentration of all of the salts very definitely shortened survival of excitability.

A further study of the uterine action of aqueous extracts of corpus luteum HAROLD H. BRYANT,* C. JELLEFF CARR AND JOHN C. KRANTZ, JR.
Dept. of Pharmacology, Univ. of Maryland School of Medicine, Baltimore

A method of testing the uterine activity *in situ* of aqueous extracts of corpus luteum has been devised. Experiments were conducted on guinea pigs and rabbits. Intravenous injections of aqueous corpus luteum extracts were shown to decrease the tone and amplitude of uterine contractions in estrogen-primed animals. The relaxant response was not elicited under these conditions by progesterone or chlorobutanol. The latter is used as a preservative in corpus luteum preparation and relaxes the uterus *in vitro*.

Metabolic fate of evipal MILTON T. BUSH, THOMAS C. BUTLER AND H. LEO DICKISON
Dept. of Pharmacology, Vanderbilt Univ. School of Medicine, Nashville, Tenn.

We have reported previously (J. Pharmacol. 69: 277 and 72: 5) the isolation from dog urine, after administration of evipal, of three products. We presented evidence that these substances were 5-methyl-5-(Δ' -cyclohexenonyl) barbituric acid, I, 5-methyl-5-(Δ' -cyclohexenonyl)-1-methyl barbituric acid, II, and a substance isomeric with the latter, III. I (m.p. 213-217°C decomp.) has now been obtained from the urine of 2 dogs in amounts equivalent to 20% of the administered *nor*-evipal (5-methyl-5- Δ' -cyclohexenyl barbituric acid). This same substance (I) has also been

obtained from the urine of 2 other dogs in amounts equivalent to 5% of the evipal administered. Substance *II* has been obtained in 15% yield from these latter dogs, but *III* only from one of them, in 0.5% of the amount of evipal given. We have now established that *I* and *II* actually are ketones. The ovime from *I* was obtained in 60% yield, of pure substance, m.p. 250–260° decomp., the ovime from *II* in 50% yield, of pure substance, m.p. 185–7°C. Elementary analyses for C, H, and N are in reasonably good accord with the theoretical values for both these ovimes. The available supply of *III* was mostly used for analyses before an ovime preparation was made.

Isolation of β -nitropropionic acid from cultures of an *Aspergillus flavus* MILTON T. BUSH AND OSCAR TOUSTER * *Depts. of Pharmacology and Biochemistry, Vanderbilt Univ. School of Medicine, Nashville, Tenn.*

Studies of the production of penicillin-like substances by an *A. flavus* led to the incidental isolation of an apparently pure organic acid from a crude 'toxic fraction A' (*J. Pharmacol.* 84: 275, 1945). This substance (*I*) was reported to have m.p. 67.5–68.5° corr., neutralization equivalent 124, and apparent ionization constants pK'_1 3.7 and pK'_2 9.1. Elementary analyses were subsequently obtained which indicated the simplest empirical formula $C_3H_5NO_4$. The recent report (CARTER AND MCCHESENEY *Nature* 164: 575, 1949) that hiptagenic acid, a compound long ago obtained from a plant glycoside, has been found to be β -nitropropionic acid (*II*) (a type of compound occurring rarely in nature) led us to consider this structure for *I*. We have synthesized *II* from silver nitrite and β -iodopropionic acid (LEWKOWITZ *J. prakt. Chem.* [2], 20: 169, 1879) and also from sodium nitrite and propiolactone. That the compounds *I* and *II* are identical we have shown by the following comparisons: the melting points and various mixed melting points were identical, the results of nitrosation tests (Victor Meyer) for primary nitro groups were the same, titrations with sodium hydroxide, using glass electrodes, gave identical curves, which showed pK'_1 3.7 and pK'_2 9.0–9.1. Both compounds showed, in these titrations, the slow reaction with NaOH in the high pH ranges characteristic of primary nitro compounds. It remains to be determined whether the β -nitropropionic acid was actually produced by the mold, which seems very likely because of the large amount present, or was already present in the medium.

A contribution to the study of mechanism of action of cardiac glycosides ANNE CAMERON (introduced by B. N. CRAVER) *Research Dept.,*

Division of Microbiology, Ciba Pharmaceutical Products, Inc., Summit, N. J.

Feline hearts were perfused after the method of Langendorff with modifications previously described (*J. Pharmacol. & Exper. Therap.* 93: 135, 1948), and to the perfusion fluid were added the following drugs in the concentrations indicated, expressed as $\mu\text{g/ml}$: atropine sulfate, 1; Decamethonium bromide 50; papaverine hydrochloride 0.5; procaine hydrochloride, 15; Pyribenzamine hydrochloride, 2; quinidine sulfate, 5; 2[N-p-tolyl-N-(m'-hydroxy phenyl)-aminomethyl]imidazoline phosphate (C-7337), 0.5; m-tolyl-oxoacetamide hydrochloride (Su-212), 0.1. The concentrations employed were well tolerated, and, save for Decamethonium bromide, were in general sufficient, as demonstrated by previous experiment, to exert the characteristic effect of each compound. After an interval of perfusion with the drugs indicated, the sensitivity of the heart to Digifoline was ascertained, and was found to be essentially that of a heart perfused with normal fluid. These results and the fact that cardiac glycosides exhibit no qualitative differences in their effects upon the hearts of all the common laboratory species of animal would suggest that these drugs act directly on the contractile mechanism of the muscle cell or very close thereto. This circumstantial evidence lends support to the studies of Horvath *et al.* on the action of cardiac glycosides on the polymerization of Actin (*Nature* 164: 792, 1949).

Studies on the new 4-hydroxycoumarin anticoagulant no. 63 R. T. CAPPS,* W. D. BATTLE,* O. O. MEYER* AND O. S. ORTH *Depts. of Pharmacology and Medicine, Univ. of Wisconsin Med. School, Madison, Wis.*

The toxic effects of Dicumarol which appeared after its clinical introduction led to the synthesis of derivatives of the 4-hydroxycoumarin type having anticoagulant action. The 4-hydroxycoumarin anticoagulant no. 63 (2-methyl-2-methoxy-4-phenyl-5-oxodihydropyrano-3,2-c(1)benzopyran) which was found to be most promising, i.e. least toxic with approximately the same hypoprothrombinemia-inducing capacity as Dicumarol (SCHEEL *et al.*, 1949), has been further tested in dogs and has been given clinical trial. Dogs were fed single doses of 5, 10, 20, 50, and 100 mg/kg and daily doses of 5 mg/kg. No deaths occurred from single oral doses. Maximum hypoprothrombinemia, as determined by the Link-Shapiro modification of Quick's method using 100% plasma, was obtained in 3 to 5 days and prothrombin times returned to normal in 5 to 7 days. Six of 7 dogs which were fed 5 mg/kg/day died after 6, 9, 9, 18, 20 and 30 administrations, respectively. One dog survived 30 doses.

Pathological findings included hemorrhagic pleural effusion, hemopericardium, subcutaneous hemorrhages and massive uterine hemorrhage. Microscopic findings are presented. Effects of vitamin K and K_1 oxide and animal age on prothrombin reaction also will be reported. Capsules of 4-hydroxycoumarin anticoagulant no. 63 were administered to patients in single and repeated dosages. A single oral dose of 2 mg/kg usually was found to produce a desired prothrombin time within 24 to 48 hours which then could be maintained with repeated smaller administrations. The prothrombin times returned to pretreatment level in an average of 9 days. No evidence of hemorrhage, changes in differential blood count, urinalysis or hepatic function tests was noted.

Cholinergic effects of F 2268 EDWARD A. CARR, JR.,* MAX KARSCH* AND DOUGLAS S. RIGGS
Dept. of Pharmacology, Harvard Med. School, Boston, Mass.

The ethylal of γ trimethylammoniumpropylpanediol (Fournau Compound #2268) was found by Bovet to be the most potent known parasympathomimetic agent with regard to action on the dog's heart. Bovet showed that this compound produced typical muscarinic effects on a variety of tissues, but he was unable to demonstrate any ganglionic stimulating action. In view of the structural relationship of F 2268 to Methacholine—the former representing a cyclic isomer of the latter—we compared the effects of these 2 drugs given intravenously to cats under dial-urethane anesthesia. F 2268 and Methacholine were found to be quantitatively very similar in their ability to lower blood pressure. F 2268 appeared only slightly more potent in producing sinus bradycardia, but the duration of the slowing caused by F 2268 was very much greater than the Methacholine-induced bradycardia. When the dose of each was 10 micrograms, the mean duration of the bradycardia was 17 minutes for F 2268 and 38 seconds for Methacholine. Other effects on the heart, such as second- and third-degree auriculo-ventricular block and auricular fibrillation, appeared with greater frequency at a given dose of F 2268 than of Methacholine. When 10 mg of F 2268 was given to atropinized cats, a rise in blood pressure occurred. Thus, in contrast to Methacholine, F 2268 has a definite ganglionic stimulating action. No appreciable tachyphylaxis to the effects of F 2268 on blood pressure and sinus rate could be demonstrated.

Potentiation of curarizing action of diacetylcholine (succinylcholine) by aliphatic dicarboxylic acid aminoethyl amides JULIO C. CASTILLO* AND EDWIN J. DE BEER
The Wellcome Research Labs., Tuckahoe, N. Y.

At the meetings of the Pharmacology Society held at Indianapolis in November 1949, the authors showed that diacetylcholine has a very evanescent curare-like action which can be greatly prolonged by the injection of an anticholinesterase such as eserine. Evidence was also presented which indicates that the prolongation of action is due, at least in part, to the inhibition of the enzyme or enzymes responsible for the destruction of diacetylcholine. Examination of the aliphatic double amides of the general formula $\text{CO-NH-CH}_2\text{-CH}_2\text{-N(CH}_2\text{)}_n\text{-I}$ (CH_2) $_n$ $\text{CO-NH-CH}_2\text{-CH}_2\text{-N(CH}_2\text{)}_n\text{-I}$ reveals that although these compounds are virtually devoid of curariform action, they nevertheless potentiate the curare-like action of diacetylcholine in the cat and prevent the inactivation of the same by cat's serum *in vitro*. In these respects the amides act like eserine, but they differ from the latter in that they do not enhance the muscarinic action of acetylcholine on the dog's blood pressure and fail to antagonize curare. In addition, the amides fail to prevent the inactivation of acetylcholine by cat's serum *in vitro*. These differences suggest that the enzyme or enzymes which destroy diacetylcholine are probably not those responsible for the inactivation of acetylcholine.

Parasympathetic blockade by alpha-alpha-diphenyl-gamma-dimethylamino valeramide HCl RALPH J. CAZORT (introduced by KLAUS R. UNNA)
Dept. of Pharmacology, Univ. of Illinois College of Medicine, Chicago

Alpha - alpha - diphenyl - gamma - dimethyl amino valeramide HCl (BL-139) is a new antispasmodic with effects on the parasympathetic nervous system resembling those of atropine. On intravenous administration in mice it is twice as toxic as atropine. The action of BL-139 on guinea pig and rabbit ileum was predominantly neurotropic, being effective against acetylcholine contractions but, like atropine, exhibiting little effect against barium chloride induced contractions. BL-139 in the same concentration as atropine produced maximal dilatation of the rabbit pupil. However, duration of mydriasis was shorter. In man the compound was equal to atropine in suppressing salivation after oral administration and caused blurring of near vision in smaller doses than atropine. Small doses of BL-139 slowed the pulse rate, but doses larger than those of atropine were needed for acceleration. A similar quantitative difference in the effect on the pulse rate between atropine and BL-139 was observed on intravenous injection in unanesthetized dogs. BL-139 increased the subcutaneous LD_{50} of physostigmine in mice 98%, atropine 113%. Decrease in frequency and increase in voltage of brain waves in curarized cats were obtained alike with BL-139.

and atropine. Thus, BL-139 shows a remarkable similarity to atropine in potency and action. Its structural relationship to other parasympathetic blocking agents will be discussed.

Cardiac glycosides of *Tanghinia venenifera* K

K CHEN AND FRANCIS G HENDERSON *Lilly Research Labs, Eli Lilly and Company, Indianapolis, Ind*

Tanghinia venenifera is a shrub resembling oleander indigenous to the coastal regions of Madagascar. The natives there have prepared a poison, known as 'Tanghin,' from the kernels of the seeds, and used it as an ordeal which has resulted in a considerable loss of population. Only recently Frèrejacque and Hasenfratz (*Compt rend Acad d c* 222 149 and 815, 1946, 223 642, 1946, 226 268, 1948) successfully isolated tanghinin, desacetyltanghinin, tanghiniferin and veneniferin. By acetylation both tanghinin and desacetyltanghinin yield acetyltanghinin. Our experiments were directed to prove the cardiac action of these 5 glycosides. By the usual methods of study each of the glycosides was found to have a digitalis-like action in either amphibians or warm-blooded animals. They were thus subjected to cat assay according to our previous procedure (*J Am Pharm A* 25 579, 1936). The following figures were obtained with 10 cats each.

GLYCOSIDE	MEAN (GEOMETRIC) LETHAL DOSE \pm S.E., $\mu\text{g/kg}$
Tanghinin	352.4 \pm 38.8
Desacetyltanghinin	231.1 \pm 14.1
Acetyltanghinin	909.7 \pm 57.6
Veneniferin	369.6 \pm 22.0
Tanghiniferin	944.3 \pm 77.0

Relation of methylated xanthine retardation of development to cholinesterase values RALPH HOLT CHENEY *Dept of Biology, Brooklyn College, Brooklyn N Y and the Marine Biological Laboratory, Woods Hole, Mass*

Fertilized eggs and 8 specific developmental stages of *Arbacia punctulata* were observed for 3 days in sea water containing di- and trimethylated xanthines (pure alkaloids) in a series of concentrations from maximum solubility down to $\text{m}/10,000$. Retardations in developmental time schedules were greatest at the 2 celled stage and during the blastula-pluteus sequence. Concentrations less than completely inhibitory molarities were more drastic on the blastula-pluteus stages. Earlier effects may be due to a competitive substrate-enzyme-drug relationship or possibly to the surface action of methylated xanthines. Later effects may be due primarily to the inhibition of an enzyme, cholinesterase, essential to larval development. Relationship does exist between ChE activity and function during embryonic

development. Augustinsson and Gustafson have shown in the sea urchin, *Paracentrotus lividus*, that ChE activity is absent in fertilized eggs during the first few hours but a sudden rise occurs at the 20-hour period and progresses to high values in the pluteus larva. Assuming ChE activity is similar in *Arbacia*, this is the time when caffeine is most inhibitory. That a methylated xanthine, caffeine, is inhibitory to ChE has been demonstrated in nerve tissue by Nachmansohn, and, in muscle by Nachmansohn and Schneemann. Inter-relationships between methylated xanthine effects and cell division and growth probably involve other factors (ATP-ase) but the correlation between the high activity value of ChE normally during the stages at which these compounds are most inhibitory is of interest to cell life and to the pharmacology of these drugs.

Positive inotropic and other actions of fluoroacetate MAYNARD B CHENOWETH AND KOMOL PENGSRITONG * *Dept of Pharmacology, Univ of Michigan, Ann Arbor*

Considerations arising from current experiments suggested the possibility that sodium fluoroacetate (FA) might exert a positive inotropic action on the hypodynamic papillary muscle. It has now been demonstrated that 10^{-5} M FA exerts a marked positive inotropic effect on hypodynamic rabbit papillary muscles while those of the cat respond similarly to 10^{-3} M FA. Lower concentrations are but slightly effective while 10-fold higher concentrations are distinctly effective but result in subsequent depression. The prior presence of acetate (0.01 M) in the bath totally prevents the actions of FA on the muscle. Addition of ouabain in concentrations known to produce a marked and prolonged inotropic action (rabbit, 1.5 million or 3×10^{-7} M, cat, 1.10 million or 1.5×10^{-7} M) after suitable amounts of FA is almost completely without effect in glucose Ringer but does stimulate the muscle when the actions of FA have been prevented by acetate. Quadrupling the concentration of calcium ions in the bath produces a less than usual inotropic response after FA. The inotropic response to epinephrine does not appear to be much affected by prior presence of FA. Possible explanations for these phenomena will be discussed.

Chemotherapy of allergic arteritis in the rabbit JAMES CLAMPIT (introduced by D M GREEN) *Dept of Microbiology, Division of Biological Research, G D Scarle & Co, Chicago, Ill*

Consistent extensive arteritis was produced in the rabbit by intravenous injection of normal horse serum in a dose of 10 cc/kg on the first and 5th days of the experiment. The animals were autopsied on the 15th day. The most extensive lesions were found in the mesentery, heart, liver

and lung and occasionally in every tissue examined Daily medication was begun usually on the 7th or 8th day and continued until the end of the experiment ACTH was effective in preventing the development of arteritis Several antihistamines and sodium salicylate had some activity while rutin, estrone, diethylstilbestrol, testosterone, histamine and ascorbic acid were inactive at moderate dose levels

Hormonal treatment of the adult cat that assures a uterus in vivo highly responsive to oxytocics
 MARY LEE CLARY (introduced by B N CRAVER) *Research Dept, Division of Microbiology, Ciba Pharmaceutical Products, Inc, Summit, N J*

The voluminous literature on the action of hormones on the uterus has been recently reviewed (REYNOLDS *Physiology of the Uterus* (2nd ed), 1949) Methods have been described for rendering the immature lapin uterus responsive (WICK AND POWELL, 1942) or for rendering that same species of uterus more sensitive to progestational action (TRIPOD AND MEIER, 1948), but they seemed inapplicable to the present problem The following conclusions were reached after scores of experiments correlating vaginal changes with uterine responses a) Cats exhibiting the cornification of estrus are suitable for immediate use in assaying oxytocics b) Cats exhibiting vaginal proestrus are suitable after 3 days if injected intramuscularly with 10 mg T D of Ovocycin Dipropionate in oil c) Cats in other stages of the cycle require two injections of the estrogen, one on the 1st day and one on the 3rd day, after which they may be used for assay on the 7th day The cytological changes of estrus developed before the uteri had become responsive, which suggests that the myometrial changes induced require longer for their development d) Ovariectomized cats treated 2 weeks after operation by the procedure indicated in no 3 yielded poorly responsive uteri, the results were better if progesterone were injected from the 9th to 13th days after the first dose of estrogen Efforts to improve the motility of the uterus during the day of the experiment have been fruitless These efforts included the injection of variable doses of aqueous solutions of estrogen, of progesterone, of androgens, and of concentrated solutions of the vitamin B complex

Absorption, plasma levels and excretion of mescaline in the dog J COCHIN,* L A WOODS AND M H SEEVERS *Dept of Pharmacology, Univ of Michigan, Ann Arbor*

In this study we utilized a specific and sensitive colorimetric method, the details of which will be published elsewhere, capable of determining mescaline in concentrations above 0.5 $\mu\text{g/cc}$ of plasma and 2.0 $\mu\text{g/cc}$ of urine Plasma levels

of mescaline are compared after oral, intramuscular and intravenous administration to the dog Following intravenous injection of 20 mg/kg (base equivalent) of mescaline sulfate, there is initially a rapid decrease in plasma level This decrease is due probably to a redistribution of the drug from the plasma to various tissues and fluids of the body Immediately after injection the animal exhibits the expected autonomic signs, cerebral depression and hyperreflexia of the limbs After 20-30 minutes, the plasma concentration levels off at about 6 to 10 $\mu\text{g/cc}$ Thereafter, disappearance of mescaline from the plasma is gradual, being complete in 6-8 hours Rate of recovery from the pharmacological effects of the drug parallels the decay curve In contrast to the report of Slotta and Müller (*Ztschr f physiol chem*, 238, 14, 1936) mescaline is found in the urine of the dog Twenty-four hour recovery of urinary mescaline amounts to 25 to 40% of the administered dose Positive identification of this product was made by preparation of the crystalline picrate derivative and comparison of the mp and mixed mp with authentic mescaline picrate 3,4,5-Trimethoxyphenylacetic acid was isolated in dog urine confirming the work of Slotta and Müller

Studies on acute beryllium poisoning in guinea pigs KENNETH W COCHRAN,* MARCELLA MAZUR* AND KENNETH P DuBOIS *Univ of Chicago Toxicity Lab, and Dept of Pharmacology, Univ of Chicago, Chicago, Ill*

Recent investigations in several laboratories have shown that beryllium inhibits alkaline phosphatases We have observed that a depression of serum alkaline phosphatase occurs in rats following acute poisoning by beryllium and that the extent of this inhibition is dependent upon the dose of beryllium In order to obtain additional information concerning the relationship between phosphatase inhibition and acute toxicity of beryllium we have employed guinea pigs which were found to be less susceptible than rats to acute beryllium poisoning The 30-day LD_{50} was 6.3 mg/kg of beryllium as beryllium chloride administered intraperitoneally to guinea pigs whereas the LD_{50} for rats was about 0.6 mg Be/kg The alkaline phosphatase activities of all normal guinea pig tissues assayed, using sodium B glycerophosphate as the substrate, were lower than those of the corresponding rat tissues Beryllium was a less potent inhibitor of alkaline phosphatases of guinea pig tissues than of rat tissues The alkaline phosphatase activity of guinea pig serum averaged 0.058 mg P/gm/hr and the concentration of beryllium producing 50% inhibition *in vitro* was 3.6×10^{-4} M, while the corresponding values for rats were 0.390 mg P/gm/hr and 1.8

$\times 10^{-6}$ M Be The following alkaline phosphatase activities were found for other guinea pig tissues: duodenum, 21.4, kidney, 16.9, and liver, 0.49 mg P/gm/hr. The molar concentrations of beryllium producing 50% inhibition of these guinea pig tissues were as follows: duodenum, 2.5×10^{-6} , kidney, 4.0×10^{-6} , and liver, 2.8×10^{-4} . No inhibition of the serum alkaline phosphatase was observed in guinea pigs 3 hours after doses of beryllium as high as 17 mg/kg. Thus there was a correlation between the species susceptibility to acute beryllium poisoning and phosphatase inhibition.

Effect of some sodium sulfonates on tuberculosis in mice VERSA V. COLE, H. R. HULPIEU AND S. H. HOPPER* *Depts. of Pharmacology and Public Health, Indiana Univ., Indianapolis*

Mice were injected intravenously with 0.2 mg/mouse of a wet culture of *M. tuberculosis* (H37). The mice were divided into groups of 10 each and fed various concentrations of surface active agents. Records of weight and food intake were kept. The mice were killed at from 10 to 19 days and the lungs and liver were graded histologically from 0 to 4 plus. The 7 agents studied were classified on the basis of their effects on tuberculous involvement at concentrations which had slight or no effects on weight and food intake. The following showed an increase in the amount of tuberculosis found in the lungs: decyl benzene sodium sulfonate, dodecyl benzene sodium sulfonate, dibutyl phenyl phenol sodium disulfonate, monobutyl phenyl-phenol sodium monosulfonate. Inconsistent results were obtained with monobutyl diphenyl sodium monosulfonate. A decrease in the amount of tuberculosis in the lungs was shown by isopropyl naphthalene sodium sulfonate and N-methyl oleamide of sodium ethyl sulfonate. The effects in the liver were less marked but in the same direction as those in the lungs. When dibutylphenyl-phenol sodium disulfonate and monobutyl phenyl-phenol sodium monosulfonate were fed with promizole their unfavorable effects on tuberculosis were eliminated. When isopropyl-naphthalene sodium sulfonate was fed with promizole its effect was changed from favorable to unfavorable. N-methyl oleamide of sodium ethyl sulfonate showed the same effect with promizole as without promizole.

Factors influencing bile flow in the dog DONALD L. COOK,* DORIS A. BEACH,* ROBERT G. BIANCHI,* W. F. HAMBOURGER AND D. M. GREFEN* *Pharmacology Dept., Division of Biological Research, G. D. Scarle & Co., Chicago, Ill.*

Bile flow was studied in dogs anesthetized with sodium pentobarbital. The cystic duct was clamped and the common bile duct cannulated.

The volume of bile was measured at half-hour intervals and pooled hourly. Aliquots were analyzed for total solid content. No bile was returned to the animals. Basal rate of bile flow (cc/dog/hour) did not correlate with either surface area or body weight in a series of 260 dogs. Nine animals were observed for a period of 10 hours. During this interval the average rate of bile flow remained constant. The rate of total solid excretion decreased with time and tended to become asymptotic. The concentration of solids correspondingly declined. The bile output for a 30-minute period following intravenous administration of dehydrocholic acid in a dose of 20 mg/kg was studied in 88 dogs. The response was related to control level of flow and body weight, suggesting that it was determined by the total dose rather than by plasma concentration, which was presumably similar in all animals. This hypothesis was tested by comparing the bile output of the 8 largest dogs in the above series with 8 additional small dogs given approximately the same total dose. In addition, the 8 smallest dogs were compared with 8 additional large dogs. The results of these tests are in accord with the hypothesis that the response to dehydrocholic acid is determined by the total dose rather than by the dose per unit of body weight.

Some pharmacological properties of L-hydrazinophthalazine, a hypotensive agent B. N. CRAVER AND F. F. YONKMAN *Research Dept., Division of Macrobiology, Ciba Pharmaceutical Products, Inc., Summit, N. J.*

Among a series of phthalazines synthesized by Druey, the most active hypotensive agent appeared to be L-hydrazinophthalazine, an initial pharmacological study of which is to be reported (GROSS, DRUEY AND MEIER *Experientia* Inpress). The present report confirms and extends their observations. The compound has been shown to exert a hypotensive action in the following species: cat, dog, guinea pig and rat. Doses of less than 25 μ g/kg are devoid of action. Progressive increases in the dose to approximately 0.5 to 1 mg/kg have produced progressive declines in the blood pressure, but further augmentations in the dosage by many fold have not augmented the effect, although higher doses antagonized partially the action of epinephrine. The hypotensive action has developed slowly, suggesting either a metabolic alteration of the material to an active compound, or perhaps a slow accession to the structures susceptible to its effect. Rarely can any reasonable dose of the compound lower the blood pressure to below 70-80 mm Hg, at which point other hypotensive agents such as acetylcholine, histamine or the nitrites are still effective. The hypotensive effects can be counteracted by pitui-

trin, Privine, ephedrine, epinephrine and nor-epinephrine, although the antagonism exerted has been sometimes relatively brief. Preliminary experiments with the canine heart-lung preparation have suggested that doses up to 100 mg have no effect. Higher doses have been followed by decreases in the cardiac rate and output and by the appearance of irregularities. Doses up to 2 mg were almost devoid of action on the perfused feline heart. In 'spinal' dogs and cats the hypotensive effects have been minimal or absent. On various isolated tissues the compound has shown little effect. Detailed toxicological studies which will be presented have evidenced low toxicity after both acute and chronic administration.

Evaluation of simaroubidin in experimental canine amoebiasis ASHTON C. CUCKLER (introduced by HANS MOLITOR) *Merck Inst for Therapeutic Research, Rahway, N. J.*

Simaroubidin, a glycoside obtained from the plant *Simarouba amara*, is a highly potent therapeutic agent for experimental amoebiasis of dogs. Repeated oral doses of 0.5, 2 and 8 mg/kg eliminate the amoebae in severely infected dogs after 5-8 days of therapy. During a follow-up period of more than 30 days the dogs remained clinically well and it was impossible to demonstrate amoebae, microscopically or culturally, during this period. At autopsy there was no evidence of amoebic infection in any of the animals. Ten oral doses of 0.125 mg/kg were ineffective. A single dose of 5 mg/kg was ineffective, and one dose of 10 mg/kg 'cleared' the infection on the fourth day of therapy. Frequent examinations for one month were negative for amoebae, however, relapse occurred after 10 weeks. A single dose of 20 mg/kg was completely effective. Comparative studies indicate simaroubidin is more potent than many of the currently used amoebicides. The toxicity of simaroubidin varies considerably with different species. The rat, mouse, rabbit and chick tolerate much more than dogs. Daily oral administration of 2 mg/kg is tolerated by the dog for 11 weeks (55 doses) without any deleterious effects. Single doses of 8 mg/kg intravenously are likewise non-toxic. Intravenous doses of 1-50 mg/kg to anesthetized dogs had no effect on respiration, heart rate or blood pressure. Oral doses of 32 mg/kg and higher are lethal for dogs, with profuse gastro-intestinal hemorrhages developing in 2-3 days. Since simaroubidin is non-toxic in therapeutic doses for dogs, it seems justifiable to recommend clinical studies in human amoebiasis.

Failure to propagate mouse sarcoma 180 after exposure to low temperature WINDSOR C. CUTTING *Dept of Pharmacology and Therapeutics,*

Stanford Univ School of Medicine, San Francisco, Calif

Gye (*Brit M J* 1 511, 1949) and Mann (*Brit M J* 2 251, 253 and 255, 1949) recently reported that various mouse tumors could be frozen at 79°C for a month or more, and then lyophilized, and yet retain their ability to induce new growths upon implantation into mice. From 1-6 weeks were required for development of the tumor. The experiments were interpreted as supporting the thesis that a viral agent was implicated in these tumors because intact cells could not withstand this physical treatment. To test this thesis further, we removed 10 sarcoma 180 tumors aseptically from their host C₃H mice 7 days after implantation, and immediately stored them, dry, in tightly corked test tubes at -79°C. Nine weeks later, 4 tumors were removed, quickly thawed and cut into portions about 1 mm in diameter and implanted subcutaneously into 38 mixed male and female C₃H mice. Eleven weeks later, at sacrifice, no tumors could be found. A second portion of 4 tumors was removed after 14 weeks of freezing, ground in a chilled mortar, and immediately refrozen. One week later the powdered tumor was thawed, suspended in glycerin phosphate buffer, and injected subcutaneously into 15 mice. Five weeks later, at sacrifice, no tumors could be found. Attempts to transmit sarcoma 180 to mice after prolonged cooling of the tumors were unsuccessful, thus lending no support to the thesis that a virus is implicated in this tumor.

Analysis of DL-norleucine inhibition in *Achromobacter fischeri* EDWIN E. DANIEL (introduced by MARK NICKERSON) *Dept of Biology, Johns Hopkins Univ, Baltimore, Md*

DL-norleucine inhibits the growth of several microorganisms, apparently by inhibiting methionine utilization. In the luminous bacterium, *Achromobacter fischeri*, DL-norleucine inhibits growth in concentrations of 0.5 µgm/20 ml. Methionine behaved as a product of the inhibited reaction in every test. (The norleucine:methionine ratio for 50% inhibition increased with the norleucine concentration up to 5000 µgm/20 ml, with norleucine and higher sub-optimal methionine concentrations other compounds were less effective antagonists, etc.) Although tested less extensively, L-homocysteine, DL-cystathionine and DL-homoserine, but not DL-threonine and L-cysteine also antagonized norleucine as products of the inhibited reaction. DL-valine, L-leucine and DL-isoleucine behave as substrates or substrate precursors for the inhibited reaction. (The ratios of norleucine:substrate for 50% inhibition are constant and they antagonize norleucine inhibition less effectively in the presence of higher methionine concentrations.) All other common amino

acids, except threonine which was inhibitory, increase growth in the presence of norleucine and low sub-optimal concentrations of valine, leucine or isoleucine, but only L-glutamic acid, DL-phenylalanine, L-tyrosine, L-aspartic acid, DL-lysine, L-cysteine, in addition to methionine and the other products, were as effective at higher concentrations. Thiamine and pantothenic acid promote growth at both high and low substrate concentrations. Harding and Shive (*J Biol Chem* 174 743, 1948) found that many of the above compounds reversed or aided in reversing norleucine inhibition in *Escherichia coli*, but methionine, threonine and homocystine appeared to be substrates or substrate precursors while valine, leucine, and isoleucine seemed to be products of the inhibited reaction.

Technique for the screening in man of bronchodilating drugs

SIDNEY DANN* AND ROBERT C. BATTERMAN, *Dept of Therapeutics, New York Univ College of Medicine, New York City*

A battery of tests of ventilatory function has been used to determine the therapeutic response of asthmatics to the standard bronchodilating drugs. These tests include vital capacity determinations after normal and after complete expiration, maximum breathing capacity (rapid breathing) and deep breathing capacity (rapid and deep breathing), residual and complemental air values and oxygen deficit. Using two dose levels each of ephedrine, epinephrine and aminophyllin, 150 tests have been completed on 65 asthmatic patients. Twelve normal individuals and 8 asthmatics have been tested using saline. Each test consists of five 'runs', the first serving as a baseline and the battery of tests being repeated at one-half hourly intervals following parenteral administration of the drug. To better estimate the response in terms of the severity of the asthma at the time of testing, patients have been grouped as *Class I* (no obvious asthma at the time of testing), *Class II* (mild to moderate subjective distress and/or typical signs of auscultation) and *Class III* (severe attack). It has been demonstrated that the maximal breathing capacity and the deep breathing capacity which serve in effect as 'stress tests' are more sensitive indicators of response to therapy than the static vital capacity. The percentage improvement as measured by the former are larger than that of the latter and more indicative of the individual's ability to ventilate. In about 10% of the cases, especially those of *Class I* and *II* major changes in the stress tests have occurred measuring up to 100% improvement when the vital capacity showed no significant changes. The values accumulated in the testing of the three basic drugs in asthmatic therapy may serve as baselines for the screening of new drugs introduced for the treatment of asthma.

Chromatographic method for the isolation of DDT and other chlorinated insecticides from fat

BERNARD DAVIDOW (introduced by ARNOLD J. LEHMAN), *Division of Pharmacology, Food and Drug Admin., Federal Security Agency, Washington, D C*

In previous reports from this laboratory it has been demonstrated that DDT and several other chlorinated insecticides are preferentially stored in the fatty tissues of animals. Solvent methods for their extraction from these tissues always include the fat component. In many cases study of the storage and tissue distribution of these chlorinated insecticides is limited by the inability of the chemical method to determine small quantities of the insecticide in the presence of comparatively large amounts of fat. A convenient and rapid chromatographic procedure has been developed which is applicable to the isolation of DDT and several other chlorinated insecticides from fat. The procedure employs a column of Celite 545 (a diatomaceous earth), a mixture of sulfuric acid and fuming sulfuric acid (15% SO₂) as the immobile solvent, and carbon tetrachloride as the mobile solvent. A column of 30 grams Celite slurried with 9 ml of sulfuric acid, 9 ml of fuming sulfuric acid and 100 ml of carbon tetrachloride will retain approximately 5 grams of fat. It is held on the column as a brownish yellow band and the chlorinated insecticide is recovered in the eluate. Upon evaporation of the eluate, less than 1 mg of extraneous residue remains. Recoveries of microgram quantities of DDT added to 5 gm of butter oil free from DDT have ranged between 90 and 100%. Preliminary trials have indicated that, in addition to DDT, the method is effective for the separation from fat of benzene hexachloride, toxaphene and chlordane.

Pharmacology of a polymer with long acting vaso-depressor properties

PETER B. DEWS* AND EDWIN J. DE BEER, *Wellcome Research Laboratories, Tuckahoe, N Y*

Polymers prepared through the condensation of alkoxyphenylalkylamines with formaldehyde generally possess vasodepressor properties. The material resulting from the interaction of N-methylhomocanisylamine with formaldehyde is particularly active in this respect. Prolonged falls in the blood pressure of anesthetized dogs were produced by doses as small as 50 gamma per kg. Evidence was obtained that the depressor effect is due to the liberation of histamine.

Effect of salicylates on sensitization to horse serum and egg white

ROBERT H. DREISBACH, *Dept of Pharmacology and Therapeutics, Stanford Univ School of Medicine, San Francisco, Calif*

Salicylates have been alleged to act as anti-anaphylactic agents by preventing antigen-anti-

body reactions (CAMPBELL *Science* 108 478, 1949) Attempts were made to check this claim Six rabbits were fed a diet containing 1.67% sodium salicylate, the salicylate blood level being usually above 20 mg/100 ml One week later these rabbits and an additional 6 rabbits (on regular diet) were injected subcutaneously with 1 ml of a 1-10 dilution of horse serum in saline This injection was repeated weekly for 6 weeks Identical arthus type skin reactions occurred in both groups of rabbits after the third injection of serum, and continued to occur throughout the experiment Twenty-two guinea pigs were injected subcutaneously with 0.1 ml of horse serum on alternate days Four weeks later, 11 of these were given 0.5 gm/kg of sodium salicylate subcutaneously Two hours later, the 22 guinea pigs were injected intravenously with 0.1 ml of serum Of 11 salicylate treated guinea pigs, 7 died of anaphylaxis, of 11 controls, only two died Twelve rabbits were injected twice intravenously and once subcutaneously with 0.5 ml of egg white, on alternate days Four weeks later, 6 of these rabbits were given 3 injections of 0.3 gm/kg sodium salicylate gastrically at 5:00 P.M., 9:00 A.M., and 1:00 P.M. One hour after the last dose, the 12 rabbits were injected intravenously with 0.5 ml of egg white all showed cyanosis and respiratory distress, and 2 controls died Accordingly, sodium salicylate showed no demonstrable prevention of the sensitivity reactions used

Effects of 3 halogenated ethylamines on cardiac arrhythmias induced by epinephrine, nicotine and cyclopropane VICTOR A. DRILL AND HARRY W. HAYS *Dept. of Physiology and Pharmacology, Wayne Univ. College of Medicine, Detroit, Mich.*

Studies were made on the ability of 3 halogenated ethylamines to block induced cardiac arrhythmias Dogs were maintained with 16% cyclopropane anesthesia and ventricular arrhythmias induced by 1) epinephrine 2) nicotine and 3) 35% cyclopropane After the production of these control arrhythmias the animals were injected with either of the following drugs 1) N-(2-bromoethyl)-N-ethyl-1-naphthalenemethylamine HBr (SY28), 2) N-(2-(2-biphenyloxy)ethyl)-N-(2-chlorethyl)butylamine HCl (SY30), and 3) N-(2-chloroethyl)-N-ethyl-9-fluorenylamine HCl (SY21) The doses used were generally 1 mg/K, occasionally 0.5 or 2.0 mg/K Following the i.v. injection of the blocking agent arrhythmias were again induced by epinephrine, nicotine and 35% cyclopropane Epinephrine (usually 1-3 μ g/K) induced arrhythmias that were prevented by the administration of SY28, SY21 or SY30 In blocking the arrhythmias SY28 and SY21 reversed the blood pressure response to epinephrine, whereas after SY30 the blood pressure response was either normal or only

slightly reduced Nicotine (0.2-0.5 mg) produced arrhythmias that were also blocked by the drugs used, although often requiring a second dose of the blocking agent before complete block was obtained SY28 and SY21 generally prevented the arrhythmias and simultaneously reversed the blood pressure response whereas with SY30 blood pressure was not reversed when the arrhythmia was prevented All three compounds usually blocked the ectopic beats induced by 35% cyclopropane The difference in effect of the above blocking agents clearly shows that blood pressure reversal is not necessary in order to block induced arrhythmias This is further shown by the following Dogs anesthetized with 16% cyclopropane received repeated doses of nicotine at $\frac{1}{4}$ hour intervals Arrhythmias, which were induced by the first injection, were absent on repeated injections at a time when blood pressure had decreased only slightly from the original values obtained

Cholinergic action of alkyl pyrophosphoramides

KENNETH P. DuBOIS AND JOHN DOULL * *Dept. of Pharmacology, Univ. of Chicago, Chicago, Ill.*

Recent studies in this laboratory demonstrated that octamethyl pyrophosphoramidate (OMPA) exerts a cholinergic action in mammals after conversion by the liver to an anticholinesterase agent OMPA differs from other phosphorus containing cholinergic compounds in exhibiting a predominant action on peripheral cholinesterase The unique properties of OMPA stimulated our interest in searching for other phosphoramides with cholinergic activity These studies led to the development of 2 alkyl-substituted pyrophosphoramides which inhibit cholinesterase *in vitro* and *in vivo* and exert predominantly peripheral cholinergic effects These compounds are unsymmetrical diethyl di (dimethylamido) pyrophosphate and symmetrical diethyl di (dimethylamido) pyrophosphate The approximate LD_{50} of the unsymmetrical compound for rats is 2.6 mg/kg intraperitoneally and 4.4 mg/kg orally It inhibited cholinesterase 50% *in vitro* at a concentration of 2.8×10^{-7} M Twenty minutes after 1.9 mg/kg intraperitoneally the cholinesterase activity of brain, submaxillary, and serum from rats was inhibited 13%, 81%, and 99% respectively while 2 LD_{50} doses (5.2 mg/kg) produced 24%, 92%, and 97% inhibition respectively The LD_{50} of the symmetrical analog was 10.7 mg/kg intraperitoneally and 12.4 mg/kg orally for rats A concentration of 8×10^{-7} M produced 50% inhibition of rat brain cholinesterase *in vitro* Twenty minutes after 7 mg/kg intraperitoneally cholinesterase activity of brain, submaxillary, and serum of rats was inhibited 2%, 64%, and 85% respectively and 2 LD_{50} doses inhibited the activity of the tissues 30%, 89%, and 99% re

spectively These experiments demonstrated the anticholinesterase action of alkyl-substituted pyrophosphoramides *in vitro* and *in vivo*

Toxicity and anticholinesterase action of p-nitrophenyl dimethyl thionophosphate KENNETH P DUBOIS, MARCELLA MAZUR* AND KENNETH W COCHRAN* *Dept of Pharmacology, Univ of Chicago, Chicago, Ill*

The methyl analog of parathion, p-nitrophenyl dimethyl thionophosphate, is an ingredient of parathion preparations employed for insecticidal purposes in Germany Recent interest in the possible use of this compound as an insecticide in this country makes information on its toxicity and pharmacological actions desirable For toxicity studies solutions of the compound in 20% ethanol and 80% propylene glycol were employed The approximate LD₅₀ for rats was 3.6 mg/kg intraperitoneally and 12.7 mg/kg orally The sex difference in susceptibility previously observed with parathion was lacking with the methyl analog The methyl analog of parathion produced 50% inhibition of rat brain cholinesterase *in vitro* at a final concentration of 1×10^{-4} M as compared with a value of 1.2×10^{-6} M for parathion In 20 minutes after an LD₅₀ dose of the compound given intraperitoneally to female rats the cholinesterase activity of brain, submaxillary, and serum was inhibited 72%, 55%, and 25% respectively At the time of death in about 10 minutes after 7 mg/kg given intraperitoneally to female rats 68%, 57% and 30% inhibition of brain, submaxillary and serum cholinesterase respectively was observed The same dose of the compound given to male rats produced similar inhibition of brain and submaxillary cholinesterase but the serum cholinesterase which is lower in males than in females was 48% inhibited These studies indicate that the methyl analog of parathion resembles parathion in acute toxicity to rats and in anticholinesterase action *in vivo* after parenteral administration

Effect of various steroids on aerobic respiration of the brain of the castrate male rat EUGENE EISENBERG*, GILBERT S GORDAN* AND HENRY W ELLIOTT *Division of Pharmacology and Experimental Therapeutics and Division of Medicine, Univ of California School of Medicine, San Francisco*

Since steroidal hormones have been shown to have anesthetic properties (SELIE, H J *Immunol* 41 259, 1941) and to inhibit aerobic oxidation of glucose by rat brain cell suspensions (GORDAN, G S AND H W ELLIOTT *Endocrinology* 41 517, 1947) studies have been carried out to investigate possible mechanisms of these actions It has been found that deprivation of gonadal steroids by castration results in elevation of the rate of oxygen uptake by rat brain (EISEN-

BERG, E, G S GORDAN AND H W ELLIOTT *Science* 109 337, 1949) This rise is not found in tissues capable of utilizing endogenous substrates (EISENBERG, E, G S GORDAN AND H W ELLIOTT *Endocrinology* 45 113, 1949) Administration of testosterone propionate prevents this increased rate of cerebral metabolism An attempt has been made to determine whether this effect is specific for testosterone or general among the steroids Male rats, castrated at 30 days of age, were treated daily with 1 mg of steroid subcutaneously per kg of body weight for the 7 days preceding decapitation at the age of 60 days QO₂ of brain cell suspensions was determined by the direct method of Warburg using glucose as a substrate Untreated castrates and estradiol dipropionate-treated animals demonstrated elevated rates of oxygen uptake Brains from castrates treated with unesterified testosterone, testosterone propionate, methyl testosterone, testosterone cyclopentylpropionate, ethinyl testosterone, progesterone, or desoxycorticosterone acetate respired at normal rates From these studies it appears that steroids with the androstene nucleus are effective in restoring the 'braking' action normally exerted by gonadal steroids upon cerebral metabolism, as measured *in vitro*

Effect of sympathomimetic amines and sympatholytics on blood sugar and lactate of the rat SYDNEY ELLIS AND HILTON L ANDERSON* *Dept of Pharmacology, Temple Univ Sch of Med, Philadelphia, Pa and Dept of Physiology and Pharmacology, Duke Univ Sch of Med, Durham, N C*

The effects of several sympathomimetic amines on the blood sugar of the non-fasting rat were determined from tail-blood obtained before, and at 30-min intervals for 2 hours following, the intraperitoneal injection of several doses of each amine The following produce marked hyperglycemia in the amount in mg/kg indicated in parentheses after each compound Epinephrine (0.1), 1-(3,4-dihydroxyphenyl)-1-amino-2-methylaminoethane (2), Kephrene (2), Phenylephrine (2), 1-(3,4-dihydroxyphenyl)-2-methylaminopropane (30), 1-(3,4-dihydroxyphenyl)-2-aminopropane (50) The following amines did not raise blood sugar in the doses given in parentheses N-isopropyl-norepinephrine (50), 1-(4-hydroxyphenyl)-1-hydroxy-2-isopropylaminoethane (100), tyramine (100), hordenine (100), Paredrine (10), 1-(3-hydroxyphenyl)-1-amino-2-methylaminoethane (30), Ephedrine (30), mescaline (10), Forthane (50), Tuamine (10), Octin (50), Oenethyl (5), 1-cyclohexyl-2-methylaminopropane (30) Dihydroergotamine and Priscol prevent the rise in blood sugar which usually follows the administration of epinephrine Dibenzamine and SY-2S appear

to have a weak adrenergic blocking action on the rat liver. Blood lactate as well as blood glucose changes were determined after epinephrine, Keph-
rine, N-isopropyl-norepinephrine, and Octin. Ep-
inephrine and Keph-
rine elevate both glucose and
lactate of the blood. N-isopropyl-norepinephrine
raises only the blood lactate concentration. Octin
affects neither glucose nor lactate concentrations
of the blood. Following the administration of di-
hydroergotamine 3 mg/kg, epinephrine raises the
blood lactate in the usual fashion, but it does not
affect the blood sugar.

**Study of some antihistaminic drugs on the con-
vulsive threshold and on the action of anti-
convulsant drugs.** G. M. EVERETT (introduced
by R. K. RICHARDS) *Dept. of Pharmacology,
Abbott Labs., North Chicago, Ill.*

Recent clinical observations have suggested
possible dangers in the use of some antihistaminics
in epileptics (CHURCHILL AND GAMMON *J. A. M. A.*
141: 18, 1949). In the present study the effect of
Pyrabenzamine (P), Thienylene (T) and Benadryl
(B) on convulsive threshold in mice was investi-
gated. P, T, and B in subconvulsive dose (10-50
mg/kg i.p.) did not affect the electroshock thresh-
old for full tonic-clonic seizures. However, the
convulsant dose of Metrazol was lowered from
75-50 mg/kg subcutaneously. In doses of 75 to
100 mg/kg subcutaneously P, T, and B produced
clonic or running convulsions. These convulsions
were not modified by Tridione, Phenobarbital,
Phenurone or Dilantin in non-sedative doses.
The anticonvulsant action of these drugs against
Metrazol and/or electroshock was unaffected by
premedication with 10-50 mg/kg intraperitoneally
of P, T or B. Studies of possible antagonism by
P, T, or B of minimal protective doses of anti-
convulsants are in progress. Altho P, T, and B
produce sedation in clinical use, the underlying
convulsant properties of these drugs should be
considered when they are used in epileptic pa-
tients.

**Pharmacological studies of two new anticon-
vulsants 3,5-dimethyl-5-ethyl-oxazolidine-2,4-
dione (Paradione) and 3-methyl-5-phenyl-hy-
dantoin (Nuvarone).** G. M. EVERETT* AND R. K.
RICHARDS *Dept. of Pharmacology, Abbott Labs.,
North Chicago, Ill.*

Paradione is closely related to Tridione. In
mice the drug is more sedative and the ataxic dose
is 250 mg/kg. This is also the minimal protective
dose against Metrazol (100 mg/kg s.c.) convul-
sions. Duration of action is 3-5 hours. In non-
sedative doses Paradione is ineffective against
supramaximal electroshock convulsions. Chronic
toxicity studies in rats and dogs (100-200 mg/kg/
day orally) for 18 months revealed no changes in
blood count or organ damage. However the bone

marrow in dogs showed a hypoplasia which was
reversible when the drug was withdrawn. Tridi-
one acts similarly. Clinical trial for 2 years has
shown Paradione to be effective in petit mal epi-
lepsy and has a lower incidence of side effects than
Tridione. Periodical blood checks are essential
with either drug however. Nuvarone in doses of
300 mg/kg orally is effective against both electro-
shock and metrazol convulsions in mice and rab-
bits. The drug has a low toxicity, the fatal dose
being 2 gm/kg orally in mice. On high doses the
animals become ataxic and comatose. Death re-
sults from respiratory failure. Nuvarone is similar
to Mesantoin in its anticonvulsant properties.
Chronic toxicity studies in dogs and rats on doses
50-150 mg/kg/day orally for a year show normal
liver and kidney function. Blood counts and
bone marrow have also remained normal. Clinical
trial for a year has shown Nuvarone to be highly
effective in grand mal and in some cases of psy-
chomotor epilepsy. Its advantage is the low inci-
dence of side effects.

**Nonspecific factors in chemotherapy of trypanoso-
miasis.** PAUL L. EWING, HERSHAL G. TREE*
AND GEORGE A. EMERSON *Univ. of Texas Med
Branch, Galveston*

The importance of body defense mechanisms in
chemotherapy of experimental trypanosomiasis
has been stressed by several workers, e.g. the
influence of hepatectomy and splenectomy on the
course of trypanosomiasis has been described
(PFEIFFER AND TATUM *J. Pharmacol. & Exper.
Therap.* 53: 358, 1935). Treatment before or
after *T. equiperdum* infection with pentnucleotide,
desoxyribonucleic acid, reticuloendothelial im-
mune serum, malononitrile, X-ray and other
agents has no appreciable effect on the course of
infection in normal or splenectomized rats or mice.
Similar results are noted with *T. lewisi* infection
in rats. Mice infected with *T. equiperdum* die in
severe hypoglycemia, treatment with glucose has
an immediate analeptic effect on moribund ani-
mals, and alloxan diabetes prolongs survival in a
significant number of animals.

**Action of cardiac glycosides on experimental
auricular flutter.** A. FARAH AND T. LOOMIS
*Dept. of Pharmacology, School of Medicine, Univ.
of Washington, Seattle*

Self-perpetuating auricular flutter was produced
in anesthetized dogs by the method of Rosenblueth
and Garcia-Ramos (*Am. Heart J.* 33: 677, 1947).
Evidence presented by the above investigators
indicates a circus pathway in this type of flutter.
We have studied the action of cardiac glycosides
on this type of flutter. In the denervated heart
ouabain, digitoxin, Lanatoside C and tincture of
digitalis in a dosage of 50 to 60% of the toxic dose
produce a slowing of the auricular flutter rate and

a reversal to a normal rhythm. The maximum rate the auricle will follow when stimulated by repetitive stimuli is probably related to the refractory period of auricular muscle. Cardiac glycosides produce a 15-25% reduction in the maximum rate when injected in amounts which stop the auricular flutter. The excitability of auricular muscle is not changed significantly by the above amounts of glycoside though toxic doses produce a definite reduction in excitability. Experiments were also conducted on the heart with the nerve supply intact. In some of these experiments digtotoxin and Lanatoside C first produced a slowing of the auricular flutter rate followed by a sudden change to an auricular fibrillation. This change from flutter to fibrillation is mediated through the vagus nerve since cutting the vagus nerves or atropinization of the dog resulted in a prompt reversal of the auricle to a normal rhythm. These effects of vagal blockade can only be seen in dogs treated with cardiac glycosides. Furthermore, electrical stimulation of the vagus or a continuous infusion of acetylcholine converted an auricular flutter to a fibrillation. It is thus probable that the vagal effects of these glycosides result in the conversion of an auricular flutter to fibrillation.

Comparative pharmacology of khellin, visnagin and khellol glucoside EDWIN J. FELLOWS, KEITH F. KILLAM,* JOHN J. TONER,* ROBERT A. DAILEY* AND EDWARD MACKO* *Research Division, Smith, Kline and French Labs., Philadelphia, Pa.*

The present studies on the crystalline components isolated from *Ammi Visnaga* were carried out because of the controversial nature of the reports on their pharmacologic action. In isolated rabbit hearts, 1:100,000 and 1:10,000 2-methyl-5,8-dimethoxyfuranochromone (khellin) caused an increase in perfusion fluid flow of 25 to 40% and 40 to 90% respectively. In these concentrations, 2-methyl-5-methoxyfuranochromone glucoside (khellol glucoside) produced a decrease in flow. A slight but inconsistent increase in flow was observed after 1:100,000 of 2-methyl-5-methoxyfuranochromone (visnagin), however, a 35 to 80% increase was noted after 1:10,000. In anesthetized dogs, 20 to 50 mg/kg of khellin or 20 to 30 mg/kg of visnagin intravenously produced transient depressor effects. After these doses, a slight increase in cardiac rate and insignificant changes in the amplitude of cardiac contraction were recorded by means of a Cushman Myocardiograph. In 4 out of 6 experiments, 20 or 30 mg/kg of khellol glucoside produced depressor effects and slight to moderate cardiac stimulation. Khellin in 1:1,000,000 to 1:100,000 caused relaxation of the isolated rectal caecum of the fowl. In the same preparation visnagin exhibited approximately two thirds the activity of khellin but khellol

glucoside was inactive after 1:1,000,000 to 1:100,000. Oral doses of 200 to 1000 mg/kg of khellol glucoside failed to antagonize the effects of aerosolized histamine in guinea-pigs weighing 150-260 grams. Significant activity was noted in guinea-pigs after 200 to 1000 mg/kg of khellin or 500 to 1000 mg/kg of visnagin orally.

Acute pharmacology of dimethyl - 2 - chloro - 2 - phenyl-ethylamine FRANK C. FERGUSON, JR. (introduced by W. CLARKE WESCOE) *Dept. of Pharmacology, Cornell Univ. Med. College, New York City*

Dimethyl - 2 - chloro - 2 - phenyl - ethylamine (DMEA) possesses adrenergic blocking and parasympathomimetic properties. In cats, intravenous administration produces convulsions, respiratory depression, bradycardia, and secretory activity. Death occurs from respiratory failure. The intravenous LD₅₀ for the cat is 2.1 mg/kg. Poisoning in rats is similar. The slowing of the heart is abolished by atropine or vagotomy. In anesthetized cats, DMEA in small doses increases the rate and depth of respiration but in larger doses promptly abolishes it. In the cat, DMEA produces a sharp fall in blood pressure, this is annulled by atropine and replaced by a slower decline that is probably due to the removal of sympathetic tone. After small doses of DMEA the blood pressure usually returns to normal within 15-30 minutes but after large doses the pressure is lowered permanently. After adequate doses of DMEA the pressor effect of epinephrine is reversed, as are the pressor responses to asphyxia and to ganglionic stimulation. The pressor activity of norepinephrine or ephedrine is abolished, while the depressor action of Isuprel is not affected. The onset of blockade after DMEA is immediate and lasts for only two to six hours. These facts and its water solubility make DMEA unique among the adrenergic blocking agents of the beta-haloalkylamine type. In water DMEA hydrolyzes to an imine ring and finally to the ethanol derivative. The imine form possesses all the activity of the intact molecule while the completely hydrolyzed form seems inert.

Evaluation of local anesthetics for nerve block J. K. W. FERGUSON AND J. F. AIKENHEAD* *Dept. of Pharmacology, Univ. of Toronto, Toronto, Canada*

Potencies relative to procaine of several local anesthetics were determined by injecting 4 or 5 concentrations of each drug in a constant volume of 0.2 cc. behind the eyeball of the guinea pig. Loss of corneal reflex was used as the index of anesthesia. Epinephrine 1:100,000 prolonged anesthesia in this location only about 20%, 1:20,000 was no better. Relative toxicities for tissue were determined by intradermal injection in guinea

pigs Toxicity was measured by the diameter of erythema and by the occurrence of petechial hemorrhage The two criteria sometimes differed seriously The criterion of petechiae was probably better Relative Ratings, viz Relative Potency/Relative Tissue Toxicity, were calculated for piperocaine, tetracaine and dibucaine Only dibucaine was significantly better than procaine

Pharmacologic action of hydrazine E A FINE, ANNE M KUNKEL AND J H WILLS (introduced by AMEDEO S MARRAZZI) *Pharmacology Section, Med Division, Army Chemical Center, Md*

Intravenous injection of rabbits, cats and dogs with 50 mg/kg of hydrazine causes retching or emesis, tonic-clonic convulsions, dyspnea, fall in blood pressure and death Emesis and increase in tonus of the intestinal muscles of the dog were obviated by vagal section or by large doses of atropine It appears, therefore, that the effect on the smooth muscle of the gastro intestinal tract is indirect and mediated through the cholinergic fibers of the vagus nerve The fall in blood pressure is believed to be caused by both direct and indirect effects on the smooth muscle of the blood vessels Although hydrazine shows some direct action on peripheral structures, its most significant action probably is on the central nervous system A decerebrated cat exhibited tonic convulsions following injection of hydrazine Cats with spinal cord section showed tonic clonic convulsions central to the section, distal to the section there was occasional tonic activity uncorrelated with that going on above the section These findings suggest some stimulatory effect on the spinal cord as well as on the brain stem

Effect of diphenylhydantoin, temperature and phosphate concentration on P^{32} uptake by frog sciatic nerve E FINGL, D M WOODBURY, J R WARD AND J E P TOMAN (introduced by L S GOODMAN) *Depts of Pharmacology and Physiology, Univ of Utah College of Medicine, Salt Lake City*

Frog sciatic nerves in groups of four were incubated in neutral, isotonic solutions containing low (0.088 mM/l) or high (92.1 mM/l) concentrations of inorganic phosphate containing tracer P^{32} , at room (20°C) or refrigerator (4°C) temperatures, and with or without diphenylhydantoin (0.5 mM/l) for periods up to 62 hours (warm) or 160 hours (cold) After being tested for excitability, nerves were frozen and analyzed individually for P^{31} and P^{32} content of their inorganic, organic acid-soluble, lipid, and residue fractions The decreasing order of rate of P^{32} uptake was inorganic, residue, organic acid-soluble, and lipid Rate of uptake was increased 10-20 times in all fractions by the thousandfold increase in external phosphate concentration Q^{10} was 3 or greater for all organic

fractions Diphenylhydantoin usually produced a small decrease in P^{32} uptake, but probably not sufficient to explain the protection seen in all nerves against hyperexcitability induced by high phosphate concentration or excessive stimulation

Comparison of the chronic toxicities of synthetic sweetening agents O GARTH FITZHUGH AND ARTHUR A NELSON *Division of Pharmacology, Food and Drug Admin, Federal Security Agency, Washington, D C*

A comparison of the chronic toxicities of the synthetic sweetening agents dulcin (p-phenetyl urea), saccharin, P-4000 (1-n-propoxy 2-amino-4 nitrobenzene), and sodium cyclohexyl sulfamate (hereinafter called sulfamate) was made Albino rats, 21 days old, 18-24 to a group, were fed for their lifetime dosages of 1, 0.5, 0.1 and 0.01% dulcin, P-4000, saccharin and sulfamate in a stock diet Additional dosage levels of 5% saccharin and sulfamate, 0.25% dulcin and 0.001% P-4000 were used Results show that these four substances may be divided into a toxic group and a relatively nontoxic group Dulcin and P-4000 showed marked toxic effects whereas saccharin and sulfamate had only a slight effect on the animals Dulcin produced liver tumors with diameters up to 2.5 cm in animals fed dosage levels of 0.1% and above At 0.5 and 1% dulcin retarded the growth rate, increased the mortality rate and produced dark red spleens, at 1% the erythrocyte count was reduced and normoblasts occurred in the blood stream P-4000 at dosage levels of 0.5 and 1% retarded growth rate and caused kidney damage The bladders of some animals on the higher dosages of P-4000 contained much fine yellowish material Thyroid glands were colored with a brown pigment which increased with dosage level A slight retardation of growth occurred in the animals on 5% saccharin and sulfamate Also the 5% sulfamate produced marked diarrhea

Thiouracil derivatives in alloxan diabetes STERLING H FLY, JR, HARVEY HAYS, JR * AND G A EMERSON *Univ of Texas Med Branch, Galveston*
Houssay and Martinez (*Rev Soc argent de biol* 24 63, 1948) noted that several 2-thiouracil derivatives cause increased resistance to diabetic effects of alloxan when given repeatedly for 12-30 days prior to alloxan In screening a large number of pyrimidines for prophylactic efficacy vs alloxan, we (*Federation Proc* 6 238, 1947, *Proc & Trans Texas Acad Sci* 30 112, 1948) found 2-thiouracil, 6-propyl-2-thiouracil, 6-methyl-2-thiouracil, 2-thiothymine, 2-thiobarbituric acid and 2,4-dithiouracil ineffective in antagonizing an intraperitoneal dose of 1.5 mm/kg of alloxan when given intramuscularly 1 hour previously, in mice fasted 20-24 hours The thiopyrimidines were given in doses of 0.5-3 mm/kg, accord

ing to tolerance. Similarly, the 2-ethylmercapto derivatives of uracil, thymine and 5-methyleytosine were not prophylactic, and thiosinamine and alloxan-5-sulfonate were without action. Adenine thiomethylpentoside, 1 mm/kg, protected only 5/9 mice, thus being inferior to most other adenine compounds. Lack of acute effective prophylactic action of thiopyrimidines indicates that these agents do not block alloxan by competitive affinities, that their —SH groups are less effective than those of dimercaptopropanol or glutathione, and that effects obtained on repeated administration are referable to changed physiological status of the experimental animals rather than to presence of the thiopyrimidines.

Addiction liabilities of some drugs in the morphine series H F FRASER,* H G FLANARY,* R W HOEDE* and HARRIS ISBELL *Research Division, USPHS Hospital, Lexington, Ky*

The addiction liabilities of dihydrocodeinone (dicodide), 6-methyldihydromorphine ('6-methyl'), and 3-hydroxy-N-methyl morphinan (morphinan) were tested in former morphine addicts, by the single dose method for the detection of euphoria (all compounds), the single dose method for relief of abstinence from morphine (dicodide and '6-methyl') and by direct addiction (all compounds). Thirty mg of dicodide and 6-methyl or 10-15 mg of morphinan subcutaneously or intravenously induced morphine-like euphoria in these subjects. Forty-five mg of dicodide administered subcutaneously at the 30th hour of abstinence from morphine relieved withdrawal symptoms almost completely. Ninety mg and 120 mg of '6-methyl' administered at the 28th and 32nd hours of abstinence produced subjective relief but had only minor effects on objective signs. Five volunteers received the drugs for 32-38 days. The maximum daily dosages attained were 240, 180, and 60 mg for dicodide, '6-methyl' and morphinan respectively. During the experiment, behavior of the men addicted to the 3 drugs resembled that of men addicted to morphine. Complete tolerance to the sedative action was not attained. The electroencephalograms of subjects receiving dicodide and morphinan were slowed throughout addiction. The pain thresholds (modified Hardy-Wolff-Goodell) of men receiving '6-methyl' were not altered but the psychogalvanic response to thermal stimulation was reduced. The intensities of abstinence from dicodide or '6-methyl' were milder than would have been expected after withdrawal of morphine. These 2 drugs may therefore have some advantages over morphine. Abstinence from morphinan was approximately equal to abstinence from morphine.

Factors affecting tissue distribution following oral ingestion of lipid soluble substances JOHN

P FRAWLEY* AND O GARTH FITZHUGH *Division of Pharmacology, Food and Drug Administration, Federal Security Agency, Washington, D C*

Considerable discrepancies have frequently been noted in results of tissue distribution experiments performed in different laboratories and occasionally in the results of duplicate experiments in the same laboratory. A study of the various factors which may affect tissue distribution has been undertaken. The beta isomer of benzene hexachloride was selected as the first test substance because of its insolubility in water and its ready solubility in lipid-like substances. Analyses were carried out predominantly upon abdominal fat of albino rats. Marked differences in the storage of the beta isomer were noted in different sexes, with the higher storage consistently in female rats. Feeding of 200 ppm beta isomer to 2 groups of female albino rats, one group 12 weeks old and the remaining group 50 weeks old, showed, after the second week, a storage of 600 ppm in the fat of the younger rats and 225 ppm in the older rats. Increases in the percentage of fat in the diet, ranging from 0% to 8%, gave a corresponding increase in the storage of the beta isomer in abdominal fat. Substitution of an emulsifier (Tween 20) for 3% of the dietary fat gave an increase in the storage of the beta isomer.

Cutaneous absorption of phenol from intact and damaged skin MARIAN V FREEMAN,* ELSIE ALVAREZ* AND JOHN H DRAIZE *Division of Pharmacology, Food and Drug Administration, Federal Security Agency, Washington, D C*

Phenol preparations are used topically as antipruritics and as antiseptic dressings for the treatment of burns, wounds, and indolent ulcers. Fatal phenol intoxications have been reported following such use (T D CRONIN AND R O BRAUER *J A M A* 139 777, 1949, W B DEICHMANN *J Indust Hyg & Toxicol* 41 146, 1949). A preparation containing 2.35% phenol in corn oil was employed in the cutaneous exposures of the rabbit. The technique (J H DRAIZE, G WOODARD AND H O CALVERY *J Pharmacol & Exper Therap* 82 377, 1942) was altered slightly to permit 48 hours of continuous exposure. Data was obtained for a) intact skin, b) abraded skin, and c) skin with severe heat burn. Total urinary phenol values were determined daily for a 5-day period prior to exposure. Similar determinations were made during exposure and until urinary excretion figures returned to base line levels. Phenol determinations were made according to Schmidt's method (*J Biol Chem* 179 211, 1949). Normal urinary phenol excretion in the control (untreated) animal is approximately 2 mg/day.

The following urinary values were obtained during the 2-day exposure period

<i>Condition of Skin</i>	<i>Total mg of Phenol</i>
Intact	43
Abraded	65
Burned (heat)	100

Phenol is readily absorbed by intact skin as is reflected by the excretion value of 43 mg/48 hr of exposure. On the other hand, the phenol excretion values were approximately 50 and 130% higher in the subjects whose skins were damaged by simple abrasion and heat burn respectively.

Morphine-induced emesis in dogs treated with β - dimethylaminoethylbenzohydrylether - 8 - chlorotheophyllinate (Dramamine) HOMER B FREESE,* ROBERT G BIANCHI* AND W E HAMBOURGER *Pharmacology Dept, Division of Biological Research, G D Searle & Co, Chicago, Ill*

Dramamine (β - dimethylaminoethylbenzohydrylether-8-chlorotheophyllinate) has been found effective in the treatment of motion and radiation sickness. A common mode of activity might be depression of the vomiting center. The known emetic action of morphine sulfate in dogs offered a tool for testing this hypothesis. The incidence of vomiting in a group of 20 untreated animals following 0.5 mg/kg of morphine subcutaneously was found to be 80%. A total of 52 animals received pre-treatment. In each experiment half received Dramamine, either 5.0 or 10.0 mg/kg orally in capsule form, and the remainder received capsules of lactose placebo. The s.c. challenging dose of 0.5 mg/kg of morphine was given 45 minutes later and the incidence of emesis determined. In one experiment a crossover design was employed, on successive days the Dramamine and placebo treatments were reversed. No significant difference was noted between the effects of Dramamine and placebo treatment, either from the viewpoint of over-all incidence of emesis, or from that of individual experiments. The incidence of emesis in treated groups did not differ significantly from that for untreated controls.

Studies on metabolism of nicotine using spectrophotometric and radioactive techniques AARON GANZ* AND F E KELSEY *Dept of Pharmacology, Univ of Chicago, Chicago, Ill*

In the course of work on the preparation of radioactive nicotine, the use of the Beckman ultraviolet spectrophotometer was developed for the routine determination of nicotine in tobacco plant extracts (*Science* 108:558, 1948). This method was found to have considerable advantages of simplicity and sensitivity, concentrations of nicotine as low as 3-5 μ g/cc being accurately determinable. Two applications of this method to

animal work have now been made. In studies using a radioactive nicotine solution to perfuse the isolated guinea pig heart, the rate of uptake of nicotine from the perfusing fluid was studied by both isotopic and spectrophotometric techniques. Good correlation was obtained between the 2 methods. More recently the method was applied to the study of the urinary excretion of nicotine by the rat. The urine of rats injected with nicotine in amounts of 5-10 mg/kg was collected and steam distilled from successive acid and alkaline media. The final distillate was then concentrated and its absorption curve determined. A typical nicotine curve was obtained which represented 8-12% of the total amount injected. This percentage represented less than 500 μ g of nicotine excreted in the urine. The spectrophotometric method was used in these experiments along with tracer techniques to determine the proportion of changed and unchanged nicotine excreted.

Factors affecting electrogram of heart muscle

SOLOMON GARB (introduced by McKEEN CATTELL) *Dept of Pharmacology, Cornell Univ Med College, New York City*

Experiments performed on isolated cat papillary muscles indicate that the T deflection is normally in the same direction as the R deflection, i.e., upright, and that it becomes depressed and inverted following anoxia, injury and excess potassium. A lowering of calcium concentration below .216 mM results in a normal electrogram without any measurable contractile force. A marked increase in rate of stimulation produces inversion of the T deflection in normal Locke's solution but not in a solution containing less than a .216 mM concentration of calcium. Excess potassium produces inversion of the T deflection, widening of the R deflection and finally, a single, slow, upward deflection. Ammonium chloride produces marked widening of the R deflection, R-T interval, and an increase in contractile force. The theory that the T deflection is produced by membrane repolarization does not explain these observations. The need for revision of the present electrocardiographic theory is emphasized by these experiments.

Effects of mercurial compounds on saccharase

C L GEMMILL AND E M BOWMAN* *Dept of Pharmacology, Univ of Virginia Med School, Charlottesville*

A study was made of the effects of various mercurial compounds of pharmacological interest on the action of saccharase. Saccharase (Invertase) obtained from Nutritional Biochemical Corporation was diluted to a suitable concentration and placed in the side arm of a Warburg vessel. Sucrose in varying concentrations in an acetate

buffer at a pH of 4.5 was placed in the main compartment of the same vessel. When the mercurial compounds were used, they were mixed with the enzyme and were in contact with the enzyme for a period of 15 or more minutes before tipping over the enzyme and inhibitor solution into the sucrose solution. The experiments were carried out at 29.3°C and the reducing sugar was determined after 10 minutes with Nelson's method. It was found that there was a direct relationship between the concentration of the mercurial and the inhibition of activity of the saccharase. The degree of inhibition varied with the mercurial.

COMPOUND	FINAL CONC. (MOLAR)		% INHIBITION
	Drug	Sucrose	
Mercuric chloride	7.4×10^{-9}	0.08	16
Merbromin	9×10^{-8}	0.08	31
Mercurin	1.7×10^{-7}	0.16	22
Thiomerin	7.5×10^{-6}	0.16	22

Analysis of the relationship of the inhibition to concentration of substrate indicated competitive inhibition. The inhibition caused by mercuric chloride was reversed by the addition of 2,3-dimercapto-propanol (BAL).

Alleged gastric mucin deficiency in peptic ulcer

GEORGE B. JERZY GLASS AND LINN J. BOYD
(introduced by MICHAEL G. MULINOS) *Dept. of Medicine, New York Med. College, Flower and Fifth Avenue Hospitals, New York City*

To evaluate the controversial issue of a deficiency in gastric mucin as a contributing factor in the formation of peptic ulcer, 60 patients with peptic ulcer and 106 control cases were studied. Two hundred tests were performed on fasting gastric secretion: 50 after an alcohol test meal, 19 after the subcutaneous injection of 1 mg histamine, and 55 after the intravenous administration of 16U of insulin. On the 841 gastric specimens collected, we determined the total dissolved mucin or its 2 fractions of dissolved mucoprotein and mucoproteose (method of Glass and Boyd) as well as the volume and acidity of the specimens. There was found neither a deficiency of dissolved gastric mucin nor of its fractions in patients with peptic ulcer as compared to controls. The output of gastric mucoprotein which was derived from gastric glands was significantly increased in patients with duodenal ulcer, as compared to controls, both in the fasting stomach and following vagal stimulation with insulin. The concentration of gastric mucoproteose was significantly decreased in duodenal ulcer. However, this was due exclusively to dilution of this substance by the increased volume of the gastric

juice, since the total amount of gastric mucoproteose was similar to controls both under fasting conditions and after insulin. Since mucoproteose is a dissolution and split product of surface epithelium mucus, this finding does not offer any support to the theory that ulcer is due to a deficient formation or to an increased mucolytic disintegration of the protective layer of gastric mucus resulting in denudation of the gastric mucosa and formation of an ulcer. Hyperacidity in duodenal ulcer could be explained by an increased volume of HCl secretion alone and not by an alleged decrease in buffering power due to deficient secretion of gastric mucin.

Quinidine in propylene glycol by intramuscular injection in man JOSEPH GLUCK,* HARRY GOLD, WALTER MODELL, NATHANIEL KWIT,* SEYMOUR THICKMAN,* WILLIAM ZAHM* AND HYMAN BAKST* *Dept. of Pharmacology, Cornell Univ. Med. College, Cardiovascular Research Unit of Beth Israel Hospital and Cardiac Service of the Hospital for Joint Diseases, New York City*

In a previous report before this Society, a method was described for the study of quinidine action on the heart in patients by the effect on the F-F interval in the electrocardiogram. The oral route was used, but in practice many cases require the parenteral route. A preparation of quinidine sulfate in propylene glycol was made available to us, and the present report deals with its behavior by i.m. injection. It was tested in 19 patients for its local irritant action, and in 7 of these, for speed of absorption, cumulation, and duration of action. There were no troublesome local reactions in 17 patients who received only 1 dose of from 0.2 to 0.6 gm. One of the remaining 2 patients receiving repeated doses of 0.4 gm. every 6 hours for 3 days developed temporary local swelling and tenderness. The peak effect on the heart developed in from 2-4 hours after a single dose, and in about 24 hours after the repeated doses. Then cumulation ceased and the plateau persisted during the remainder of the 3 days of treatment. Approximately 75% of the maximum effect disappeared in about 8 hours. The curves of action were essentially similar to those after similar oral doses. These results showed that quinidine sulfate in propylene glycol by i.m. injection provides a satisfactory substitute in cases in which the oral route is not feasible.

Binding of barbiturates by rabbit tissue homogenates LEO R. GOLDBAUM* AND PAUL K. SMITH *Toxicology Section of Army Med. Dept., Research and Graduate School and Dept. of Pharmacology, George Washington Univ. School of Medicine, Washington, D. C.*

The extent of binding of various barbiturates

by rabbit tissue homogenates was investigated using the ultrafiltration technique of Lavietes. The tissues were homogenized with m/15 phosphate buffer pH 7.4 in an all glass tissue grinder. The final dilution of the tissue used for ultrafiltration was 1:4 and the barbiturate concentration was 0.0005 M. The barbiturate concentration was determined by means of ultraviolet spectrophotometry. The results show that liver homogenate has the greatest binding capacity for the barbiturates studied followed by kidney, plasma, brain and, red cells with muscle the least. Thio-pental was bound to the greatest extent to all the tissues studied followed by seconal, pentobarbital, phenobarbital and barbital. This order was identical to that found in ultrafiltration studies with crystalline bovine serum albumin, suggesting similar mechanisms involved in the binding of barbiturates by tissues. These results correlate well with the distribution of barbiturates in rabbits. The tissues having the highest drug concentration have the greatest binding capacity. The strongly bound barbiturates tend to concentrate in those tissues that have high binding capacities resulting in a high ratio of tissue concentration to plasma level. The weakly bound barbiturates tend to distribute themselves in the body water with a ratio of tissue concentration to plasma level near unity.

Effect of benzodioxane (933 F) on hypertension due to circulating nor-epinephrine (In man)

MARCEL GOLDENBERG AND HENRY ARANOW, JR (introduced by H. B. VAN DYKE) *Dept of Medicine, Columbia Univ College of Physicians and Surgeons, New York City*

Since nor-epinephrine as well as epinephrine has been demonstrated in pheochromocytomas, an investigation of the effect of piperidylmethylbenzodioxane on nor-epinephrine mediated hypertension in man was undertaken. An increase in systolic blood pressure averaging 44 mm Hg (range 20-93 mm) and in diastolic blood pressure averaging 25 mm Hg (range 14-40 mm) was produced in 19 normotensive subjects by the controlled intravenous infusion of nor-epinephrine. When the blood pressure became stabilized (with a constant rate of infusion of nor-epinephrine) 933 F in doses of 0.25 mg/kg was given intravenously over a period of 2 minutes. In every instance the injection was followed by a fall in systolic and diastolic blood pressure, the systolic fall averaged 22 mm Hg (range 4-46 mm) and represented 50% of the average increase produced by nor-epinephrine, the diastolic fall averaged 20 mm Hg (range 8-38 mm) and represented 68% of the nor-epinephrine mediated increase. The duration of the diminution in blood pressure produced by 933 F averaged 5½ minutes (range

190 to 570 seconds). A pheochromocytoma removed from a patient exhibiting persistent hypertension was analyzed by chemical means (partition chromatography on filter paper and von Euler's colorimetric method). More than 97% of its catechol fraction was nor-epinephrine and only a trace of epinephrine was found. Benzodioxane had been administered on 2 occasions to this patient prior to the removal of her tumor, and in each instance a significant fall in arterial tension resulted. The removal of the tumor relieved the patient of her hypertension. These data demonstrate that hypertension due to circulating nor-epinephrine in man is more susceptible to the adrenergic blocking action of 933F than animal data had suggested.

Effect of diuretics and nephrotoxic drugs on kidney ATP-ase

ANDRES GOTH, JAMES HOLMAN* AND VIRGINIA O'DELL * *Dept of Physiology and Pharmacology, Southwestern Med School, Dallas, Tex*

Certain diuretics and nephrotoxic drugs were found to inhibit adenosine triphosphatase activity of homogenized rat kidneys. The method used was that of DuBois and Potter. The ATP-ase activity of rat kidneys was of the same order of magnitude as that of the heart. The following drugs inhibited kidney ATP-ase in concentrations of 0.001 M or less: meralluride sodium, salyrgan, theophylline, mercuric chloride, caffeine and sodium benzoate, theophylline ethylenediamine, uranium acetate and aerosporin. Drugs which had no effect were urea, sodium chloride, pituitrin, phlorizin, digoxin, epinephrine, histamine, alloxan, sodium cyanide and bacitracin. Since all drugs which inhibited kidney ATP-ase are known tubular inhibitors or tubular damaging agents, it is postulated that these findings may reflect one of the mechanisms of drug induced diuresis and kidney damage. The results of *in vivo* as well as the *in vitro* experiments will be presented.

Synergism between bacitracin, polymyxin B, and streptomycin HCl *in vitro* tests with *Endamoeba histolytica* and organism *t*

MIRIAM GOULD AND EDER LINDSAY HANSEN (introduced by HAMILTON H. ANDERSON) *Division of Pharmacology and Experimental Therapeutics, Univ of California School of Medicine, San Francisco, Calif*

The activity of a combination of bacitracin, polymyxin B, and streptomycin HCl *in vitro* was determined using *E. histolytica* and organism *t*, an enteric, gram negative, spore-forming bacterium, in liver-proteose-peptone medium (Hansen). The compounds were prepared in aqueous solutions and observations made after incubation for 48 hours in cotton-stoppered and sealed cultures (HANSEN *Federation Proc* 8:299, 1949). Utilizing

the same test procedure, Bradin and Hansen found emetine hydrochloride to be amebicidal at 1 100,000-1 400,000 dilution, in both open and sealed cultures. Despite the relatively low activity levels of the 3 antibiotics, it was believed desirable to determine whether synergism might occur, and whether in combination, their potential usefulness as amebicides could be anticipated. Each agent, and particularly bacitracin, was inhibitory towards organism *t*. In combination these agents exhibited marked synergistic activity against the bacterium. Death of amebas occurred at approximately 1/16 the minimal apparent amebicidal concentrations of the separate compounds when these were added together to the open and sealed cultures. The final proof of value of the combination of bacitracin, polymyxin B and streptomycin in anti-amebic therapy rests on *in vivo* trials.

Effect of temperature on uptake of radioactive phosphate by human erythrocytes DESMOND R. H. GOURLEY* AND CHALMERS L. GEMMILL
Dept. of Pharmacology, Univ. of Virginia Med. School, Charlottesville

Radioactive phosphorus (P^{32}) has been used to determine the uptake of phosphate by human blood cells *in vitro*. The percentage P^{32} leaving the plasma in a given time is the same whether or not white cells are present. Thus, at least in the initial phase of the transfer, most of the P^{32} leaving the plasma is taken up by the erythrocytes. A study of this transfer process has been made at 9 temperatures ranging from 15°-40°C. At temperatures from 15°-22°C, the P^{32} uptake by the erythrocytes is so small that it approaches the absolute experimental error in the determination of the P^{32} remaining in the plasma (approximately $\pm 2\%$). From 22°-40°C the rate at which P^{32} disappears from the plasma is much greater and increases as the temperature rises. At 37°C approximately 50% of the added P^{32} has been taken up by the erythrocytes within 100 minutes. In the initial phase of the transfer, the reaction is of the first order. The data obtained at the various temperatures conform to the Arrhenius expression relating the transfer velocity to temperature. The activation energy, μ , calculated from the Arrhenius equation, is 16,700 calories. The marked difference in the transfer velocity over the relatively small absolute temperature range investigated indicates that the transfer process is chemical rather than physical in nature.

Chronic toxicity study of veriloid in rats and dogs JAMES T. GOURZIS, ROBERT O. BAUER AND WALTER W. JETTER (introduced by GEORGE L. MAISON) *Dept. of Pharmacology, Boston Univ. School of Medicine, Boston, Mass.*

One hundred and forty-two white Wistar rats and 12 mongrel dogs, separately housed and divided equally as to sex, were fed graded doses of Veriloid (J. W. Dart Labs' purified, reproducible extract of *Veratrum viride*) daily for 6 months. The rats received Steenbock's diet *ad libitum* whereas the dogs were presented with 15 gm/kg of horse meat 3 times daily. To these diets were added appropriate amounts of Veriloid. Food and drug consumption and weight were recorded weekly. Thirty rats and 3 dogs served as controls concomitantly with the experimental animals. At the end of 6 months each rat in the 'high' group had consumed an average of 7.44 mg/kg of Veriloid/day, while the 'medium' and 'low' groups had averaged 5.13 and 3.11 mg/kg respectively, equivalent to 70, 50 and 30 times the average daily/kg dose for humans as reported by Wilkins (*Proc. Soc. Exper. Biol. & Med.* 72:302, Nov. 1949). The weight growth curves were depressed in an amount roughly proportional to the dose of the drug. Adult rats appeared to be more resistant to the lethal effects of high dosage than young rats. The dogs averaged a daily consumption of 0.15-0.25 mg/kg. Emesis and refusal to eat the experimental diet accounted for the low dosage regimen in this species. Complete blood counts of both species and BSP tests of the dogs were unchanged from control values. Gross and microscopic pathologic changes will be discussed.

Cardiac action of certain sterols C. W. GOWDEY,* J. S. LOYNES* AND R. A. WAUD *Dept. of Pharmacology, Univ. of Western Ontario, London, Canada*

The cardiotonic effect of cholesterol, ergosterol, and certain phytosterols on the isolated frog heart was reported previously (*Federation Proc.* 8:344, 1949). This led us to investigate other compounds with closely-related chemical structures including cholesterol, stigmasterol, sitosterol, ergosterol, calciferol, cholic and desoxycholic acids, sodium dehydrocholate, glycocholate, and desoxycholate, estrone, estradiol, progesterone, pregnenolone, pregnandione, testosterone, androsterone, dehydro-isoandrosterone, androstanedione, and desoxycorticosterone. All of these with the possible exceptions of dehydro-isoandrosterone and progesterone produced a marked augmentation of the hypodynamic frog heart with little change in heart rate, and no tendency towards systolic standstill. This increased force of contraction occurred whether the compound was a) administered in fine suspension, in micro crystals, or b) dissolved first in propylene glycol or ethyl alcohol. The chief difficulty in testing sterols on the isolated rabbit Langendorff heart is their insolubility. The following compounds, however, have been investigated in concentrations varying from 2×10^{-4} to 10^{-5} sodium salts of dehydro-

cholic, desoxycholic, and glucocholic acids, the B-glucoside of desoxycorticosterone, sodium hemisuccinates of testosterone, cholesterol, dehydroisoandrosterone, pregnenolone, sodium estrone sulfate, and premarin. All of these except sodium cholesteryl succinate produced a large increase in coronary flow in the hypodynamic heart. The glucocholate, dehydrocholate, testosterone, estrone, premarin, and trans-dehydroisoandrosterone salts greatly increased the coronary flow, and markedly increased the force of contraction over a period of 5-20 minutes, but had little effect on heart rate. Desoxycholate and cholesterol salts were toxic and tended to cause systolic arrest. It is interesting that the sterols, which are chemically related to digitalis, should also have an augmenting action on the heart.

Effect of denervation on motility and response to atropine of terminal ileum and colon of the dog
 GRACE W. GRAY,* R. M. WHITROCK* AND M. H. SEEVERS *Dept. of Pharmacology, Univ. of Michigan, Ann Arbor*

These experiments were undertaken to investigate the possibility of extending the atropine inhibition of intestinal motility by the surgical section of the extrinsic parasympathetic nerves supplying the terminal ileum and colon. Healthy trained mongrel dogs were prepared with a terminal ileostomy, ascending colostomy, and descending colostomy. Kymographic recordings of normal intestinal motility and response to atropine were obtained simultaneously in these 3 regions by means of the balloon-air-bromoform manometer method. Supra-diaphragmatic vagotomy was performed and recordings of motility and response to atropine were repeated. Next, the extrinsic parasympathetic inflow to the colon was sectioned at the sacral promontory. Recordings were again repeated. In other animals, sacral parasympathectomy preceded vagotomy. All recordings were obtained in unanesthetized animals after full recovery from surgery. A table indicates the normal and post-denervation responses to 0.5 mg atropine i.v. in terms of duration of action.

Rapidity of pituitary adrenocorticotrophic hormone (ACTH) release in response to stress
 WILLIAM D. GRAY AND PAUL L. MUNSON (introduced by D. D. BONNYCASTLE) *Dept. of Pharmacology, Yale Univ., New Haven, Conn.*

The mechanism by which certain stimuli cause release of ACTH from the pituitary is being investigated in the rat. Reduction in adrenal ascorbic acid concentration serves as the criterion indicating increased ACTH secretion. Control rats (Holtzman, 80-120 gm) under Nembutal anesthesia are unaffected by saline injections into the tail vein, while i.v. histamine, 0.3-0.4 mg/100 gm, results in a marked decrease in adrenal as-

corbic acid. Aqueous adrenal cortex extract (Wilson) (ACE), 1.0 ml/100 gm, i.v., 2-10 seconds before histamine almost completely inhibited the ACTH release. If ACE injection was begun 3 seconds after histamine, inhibition was less marked but still present. If injection of ACE was delayed until 5-10 seconds after histamine, little if any inhibition was observed. These results confirm the findings of Sayers and Sayers that high blood levels of adrenal cortex hormones tend to prevent the release of ACTH by the pituitary. They also indicate that the pituitary release of ACTH in response to histamine is very rapid.

TREATMENT	NO. OF RATS	ADRENAL ASCORBIC ACID
		mg/100 gm
Controls	22	444 ± 8
Histamine (H)	21	286 ± 7
ACE, 5-10 sec after H	15	310 ± 21
ACE, 3 sec after H	9	341 ± 24
ACE, 2-10 sec before H	10	419 ± 10

Effects of desoxycorticosterone glycoside on cardiac and renal function
 D. M. GREEN AND A. D. JOHNSON,* W. C. BRIDGES,* J. H. LEHMANN* AND F. GRAY *Dept. of Medicine, Univ. of Washington School of Medicine, Seattle*

Desoxycorticosterone glycoside (DCG) was administered to 13 human subjects by continuous intravenous infusion at the rate of 20 mg/square meter/hr. Blood pressure, glomerular filtration rate, renal plasma flow, sodium and water excretion were measured during two 20-minute control periods and three 20-minute periods of drug administration. Simultaneous measurements of cardiac output and total peripheral resistance were made in 6 of the subjects. The most pronounced action of DCG on renal function was an increase in water output. The effect on sodium excretion was variable. A net increase was observed in 7 patients and a decrease in the remainder. Urinary sodium concentration showed a consistent reduction which averaged 12% below control levels. Glomerular filtration rate and renal plasma flow rose moderately at the start of infusion and reverted toward control levels with its continuation. The filtration fraction remained essentially unchanged. No significant change in blood pressure followed DCG administration. A small net fall in cardiac output was observed which coincided with an average rise in total peripheral resistance of 15% above control values. Some correlation was noted between direction and magnitude of the changes in peripheral resistance, filtration rate and plasma flow.

Production of anesthesia in mucous membranes by procaine and physostigmine
 MARGARET E.

GREIG, W. C. HOLLAND* AND P. E. LINDVIG*
*Dept of Pharmacology, Vanderbilt Univ School
 of Medicine, Nashville, Tenn*

We have previously reported that the selective permeability of living cells appears to be related to the activity of the acetyl choline—cholinesterase system. This was shown in mammalian erythrocytes (*Arch Biochem* 23:370, 1949) and in the blood brain barrier of the frog (*Science* 110:237, 1949). It is well known that procaine is not an effective surface anesthetic as it does not appear to penetrate the mucous membrane. We have found, however, that when procaine and physostigmine were together instilled into the eye (rabbit or dog) the corneal reflex was rapidly abolished (2–3 minutes) and good anesthesia was produced. Physostigmine alone had no such effect. In a series of 19 rabbits and 11 dogs it was found that the effects of physostigmine and procaine together were significantly different from those of procaine alone.

Actions of L-hydrazinophthalazine (C-5968) on vasomotor reflexes and hypertension in dogs and man. K. S. GRIMSON, J. R. CHITTUM* AND B. H. METCALF* *Dept of Surgery, Duke Univ School of Medicine, Durham, N. C.*

L-hydrazinophthalazine (C-5968) has been given to normal dogs, dogs with 'neurogenic hypertension,' and patients with 'essential hypertension.' Two mg/kg orally given dogs with hypertension several months after elimination of depressor nerves produced average reduction of blood pressure in 7 from 202 mm Hg to 114. One mg/kg i.v. in 5 caused reduction from 196–84, 2 mg/kg i.v. in 6 from 218–89, 1 mg/kg i.m. in 6 from 218–126, and 2 mg/kg i.m. in 7 from 218–90. In 8 patients 20–125 mg i.v. produced moderate reduction of pressure in 4 and definite reduction in 4. The pressor response with breath holding was blocked in 4 and with a hand in ice water, blocked in 1 and depressed in 2 of 5 tested. Toe temperature rose in 5 of 7 tested. Administration of 100–250 mg/patient orally in 6 tests variably effected reduction of pressure, block of reflexes, and warming of toes. Chronic treatment of patients with hypertension effected no persistent reduction of blood pressure. During 4 experiments in dogs 2–5 mg/kg gradually reduced blood pressure during $\frac{1}{2}$ hour, an effect lasting several hours. Pressor response with occlusion of carotid arteries was reduced or blocked, that with 1–3 μ g/kg of epinephrine was depressed, though with anoxia and central vagus stimulation pressor response was not depressed. In 4 dogs 25–27 mg/kg did not prevent normal increase of blood pressure with increased intracranial pressure.

Studies on some smooth muscle effects of 3-hydroxy - N - methylmorphinan hydrobromide

(Nu-2206) E. G. GROSS AND R. M. FEATHERSTONE *Dept of Pharmacology, State Univ of Iowa College of Medicine, Iowa City*

The effect of Nu-2206 on gastric, intestinal, and colonic motility, pyloric sphincter tone and motility, tone and capacity of the bladder, and urethral resistance to the outflow of urine were studied on unanesthetized dogs. Small intestinal activity was also observed in one human patient with a Maydl jejunostomy. Intestinal and gastric activities were studied by the water-filled balloon technique, and pyloric sphincter action by Quigley's air-filled triple balloon method. Bladder and urethral measurements were obtained by using Winter's modification of methods described by Langworthy. Dosages of 0.05–0.10 mg/kg were used for intestinal studies in the dog, with a total of 2 mg subcutaneously being used in the human subject. For the bladder measurement, 0.025, 0.05, 0.075, 0.1 mg/kg were used. Typical morphine-like reactions were obtained in the GI tract studies, namely loss of gastric motility, increased tone of the pyloric sphincter, upper and lower ileum and colon. These observations suggest that Nu-2206 might produce constipation, however, in over 300 postoperative cases in the University hospital, this has not been a noticeable feature of the drug's action. Larger doses have not been used in the dog because of the high incidence of vomiting when such doses are given. In the dose range studied, this drug has no significant effect upon the tone and capacity of the bladder or upon urethral resistance to the outflow of urine.

Effect of certain analgesics upon intestine and uterine smooth muscle. CHARLES M. GRUBER, JR., CHARLES M. GRUBER AND KWANG SOO LEE* *Dept of Pharmacology, Jefferson Med College, Philadelphia, Pa.*

An attempt was made to determine the relative activities of Nu-2206 (3-hydroxy-N-methylmorphinan), metapon, morphine, Nu-1196 (dl- α -1, 3-dimethyl-4-phenyl-4-propionyloxy piperidine hydrochloride), methadone, and demerol upon segments of excised and intact rabbit uteri, excised rabbit intestine, and the intact intestine of the unanesthetized dog. The effect of Nu-2206 and Nu-1196 on excised uterus was stimulation. The minimum concentrations for which activity could be determined were 1/200,000 for Nu-1196 and 1/100,000 for Nu-2206. For all concentrations recovery was complete. Morphine had about 1/10th the activity of Nu-2206. The intact rabbit uteri were weakly stimulated by the intravenous injections of Nu-1196 and Nu-2206. Depression of the excised rabbit intestine occurred on the application of either Nu-1196, demerol, methadone or morphine. In general, the effects of equal

concentrations of demerol and Nu-1196 were about the same. These drugs were about 5 times as active as morphine and were one fifth as active as methadone. The action on excised intestine was opposite to that of acetylcholine and barium chloride. The intact intestine of unanesthetized dogs responded with approximately similar increases in tone following the i.v. administration of 0.001 to 0.005 mg/kg Nu-2206, 0.005 mg/kg metapone, 0.01 mg/kg morphine sulfate and 0.1 mg/kg of either Nu-1196, methadone or demerol. With large doses the height of the rhythmical contractions and peristaltic activity was decreased due to the increased general tonus.

Inhibition central nervous system produced by chronic cocaine intoxication CARLOS GUTIERREZ-NORIEGA *Dept of Pharmacology, Universidad Mayor de San Marcos, Lima, Peru*

The intravenous injection of cocaine induces, in cocaine addicted to this drug, states of general inhibition of the central nervous system. The inhibitory states, accompanied by plastic rigidity of the skeletal muscles (catalepsy), were found in 30% of the addicted dogs studied. States of excitation, with complex hyperkinesia, precede and ensue the states of inhibition. In the course of the inhibition produced by cocaine, general analgesia and symptoms of parasympathetic stimulation were always present. Stimulants of the central nervous system (caffeine, harmaline, desoxyephedrine, ephedrine) and atabrine, potentiate the motor and sensitive inhibitions produced by cocaine in the addicted dogs. Alkalines, ethyl alcohol and cholinergic drugs also potentiate, in lesser degree, the cocaine inhibitory actions. Barbiturates, at subnarcotic doses, antagonize the motor inhibition produced by cocaine in the addicted dogs, and restore the voluntary movements. The general analgesia produced by cocaine in the addicted dogs is suppressed by barbiturates. A very rapid recovery of normal sensibility follows the injection of barbiturates. It was also shown that barbiturates restrain the symptoms of parasympathetic stimulation caused by cocaine in the addicted dogs. The stimulant central action of cocaine is not antagonized by barbiturates, on the contrary, it is increased in high degree in some cases. This apparent reversal of barbiturate depressive action is due to the fact that these compounds remove central inhibitions. Fatty and vascular degeneration of the liver cells was found in some of the cocaine addicted dogs.

Studies on pharmacology of dramamine LEONARD B. GUTNER,* WILBUR J. GOULD* and ROBERT C. BATTERMAN *Dept of Therapeutics, New York Univ College of Medicine, New York City*
Dramamine (beta-dimethylamino-ethyl benzo-

hydril ether γ -chlorotheophyllinate) has recently been introduced for the prevention and treatment of labyrinthine disorders, especially motion sickness. In an effort to ascertain its pharmacologic action, the cold microcaloric test and galvanic stimulation of the mastoid area were utilized, the former depending upon the integrity of the peripheral end-organ of the labyrinth and the latter upon an intact vestibular nerve tract. Sixteen patients underwent 26 trials, each of which consisted of a control period and serial measurements following the oral administration of one of these drugs, dramamine 100 mg, diphenhydramine 50 mg, hyoscine hydrobromide 0.6 mg, allyl 1-methyl-butyl barbituric acid (seconal) 100 mg, theophylline ethylenediamine (aminophylline) 500 mg, and γ -chlorotheophylline 50 and 100 mg. It was found that dramamine markedly depressed labyrinthine function as judged by its effect upon the onset, and duration and character of the induced nystagmus and the milliamperage necessary to produce tilting. Subjective vertiginous sensations were also significantly reduced. The drug produces these effects by acting both upon the vestibular end-organ and the nerve tract, peripherally or centrally. The other drugs had no significant action upon labyrinthine function although in some instances the induced dizziness (subjective) was decreased probably due to a central sedative action.

Hypothermic agents I 4-amyli N-benzohydril pyridinium bromide (B-45) and alpha naphthylmethyl imidazoline (privityne) JULINA GYLFE, ROBERT HENDRICKS, SIDNEY OCHS and H. L. WILLIAMS (introduced by C. C. PFEIFFER) *Dept of Pharmacology, Univ of Illinois College of Medicine, Chicago*

B-45 produces hypothermia in mice, rats, and guinea pigs in doses of 1-3mg/kg subcutaneously. In rats, the fall in body temperature is accompanied by hyperglycemia, glucosuria, diuresis, and a decrease of 32% in the basal metabolic rate. A dose of 2mg/kg intravenously in anesthetized dogs has a marked pressor effect which is diminished by adrenalectomy and completely blocked and reversed by adrenergic blocking drugs such as SY-28. The pressor effect is not altered by nicotine, tetraethylammonium chloride, or transection of the cervical cord. B-45 resembles epinephrine in its peripheral vasoconstricting effect. In the cat, it causes retraction of the nictitating membrane and maximal dilatation of the pupil. The hypothermic effect of Privityne is not confined to lower species of animals, but is also seen in cats and man. A table of toxicities demonstrates that it becomes more potent as animals of higher developmental levels are tested. The minimum effective dose for producing a significant fall in

body temperature of the rat is 25mg/kg subcutaneously

COMPARATIVE TOXICITIES (LD 50)

SPECIES	ROUTE	B-45 (mg/kg)	PRIVANT (mg/kg)
Mouse, 20 gm	Intravenous	1.3	170
	Subcutaneous	1.6	
	Intraperitoneal	1.5	
	Oral	35.0	
Rat, 200 gm	Subcutaneous	4.0	385
	Intraperitoneal	8.0	
	Subcutaneous	15-20	
Guinea pig			
Rabbit	Intravenous	10-12	0.8
	Subcutaneous	35-40	0.95
Dog	Intravenous	30-40	0.1
	Effective pressor dose intravenous	2-5	
Man	Effective oral dose	>750 (total dose)	5-10 (total dose)

Absorption, distribution, and excretion of sodium fluoroacetate (1080) in rats ERNEST C HAGAN, L L RAMSEY AND GEOFFREY WOODARD (introduced by A J LEHMAN) *Division of Pharmacology and Division of Food, Food and Drug Admin., Federal Security Agency, Washington, D C*

Adult rats were given single doses of aqueous sodium monofluoroacetate by stomach tube (5.8, 3.3, and 1.8 mg/kg). The rats dosed at the 5.8 mg/kg level were killed at the end of 5 hours and the organs pooled in their respective categories for analysis, (*J Assoc Off Agric Chem* 32:788, 1949). 1080 was found in concentrations of about 5 ppm in the heart, kidney, brain, skin plus hair, and carcass, and only about 1.5 ppm in the liver. Only about 1% of the ingested 1080 was found in the urine and feces. Twenty-five of the 60 rats dosed at the 3.3 mg/kg level died within 24 hours and the balance were sacrificed at the end of that period. Analysis of the organs of this group showed values for living and dead animals respectively of liver 0.5 and 0.6 ppm, kidney 0.7 and 1.6, heart 1.0 and 2.2, brain 0.9 and 2.0, carcass 0.8 and 1.8, skin 0.9 and 1.8. Of the 1080 administered, 17% remained in the stomach and small intestine of the living rats and 22% in those dying. The total 1080 accounted for was 39% in the living and 71% in the dead animals. The rats dosed at the 1.8 mg/kg level were killed at the end of 48 hours. The urine and feces collected

during this period contained only 10% of ingested 1080 and the entire bodies about 10%.

Effect of long-acting antihistaminic drugs on capillary bed THOMAS J HALEY AND MARGARET ANDERSON * *School of Medicine, Univ of California at Los Angeles*

Using the method previously described (HALEY AND HARRIS *J Pharmacol & Exper Therap* 95:293, 1949) several of the long acting antihistaminic drugs have been evaluated for their capillary effects. All of the drugs caused closure of the precapillary sphincters, a decreased flow through the capillary bed and leukocyte sticking. The degree of activity was directly related to concentration.

Antagonism of cholinergic triad by β -diethylaminoethyl xanthene-9-carboxylate methobromide (Banthine Bromide) W E HAMBOURGFR, DONALD L COOK* AND D M GREEN *Pharmacology Dept., Division of Biological Research, G D Scarle & Co., Chicago, Ill*

Acetylcholine mediates the transmission of impulses in 3 areas of the peripheral nervous system. These sites, which form the cholinergic triad are a) all autonomic ganglia, b) the neuro-effectors of all parasympathetic and some sympathetic nerves, and c) somatic neuro-muscular junctions. Antagonists are known for the action of acetylcholine at each of these 3 sites. Blockers for (a) include nicotine and tetraethyl ammonium (TEA), for (b) the atropine alkaloids and Dibutoline, and for (c) curare and bistrimethyl ammonium decane (C 10). The blocking action of each of these drugs is directed predominantly against a single cholinergic function. Evidence exists which suggests that several are capable of antagonizing more than one function. β -diethylaminoethyl xanthene-9-carboxylate methobromide (Banthine Bromide) blocks all 3 cholinergic actions at specific dosages. Small doses of Banthine approach atropine in neuro-effector anti-cholinergic action. Moderate doses equal TEA in producing superior cervical ganglion blockade and have twice the potency of TEA against pelvic nerve stimulation of the bladder. Large non-lethal doses exert a reversible curare-like effect on the sciatic-gastrocnemius system. Lethal doses produce generalized flaccid paralysis with consequent respiratory failure.

Effect of thyroxine and dinitrophenol on renal functions CARROLL A HANDLEY *Dept of Pharmacology, Baylor Univ College of Medicine, Houston, Texas*

The subcutaneous administration of 0.5 mg/kg of thyroxine daily for 5 days to 4 dogs resulted in an average increase in renal functions as follows: glomerular filtration rate 40% (range 21-56%), renal plasma flow 46% (range 36-60%), and maxi-

mal rate of dextrose absorption by the renal tubules (TmG) 49% (range 32-67%) Dinitrophenol produces similar changes in renal functions An hour after the intravenous administration of 5 mg/kg of dinitrophenol to 5 dogs, the average increases in glomerular filtration and TmG were 38% (range 19-50%) and 33% (range 20-41%) respectively In the latter experiments, renal plasma flow was not measured because metabolic products of dinitrophenol interfere with p-aminohippurate determination These observations seem to indicate that these metabolic stimulants activate additional nephrons in the kidney and that thyroxine has no specific action on enzyme systems concerned in the reabsorption of dextrose from the renal tubule as has been suggested (*Am J Physiol* 140 699, 1944)

Pathological muscle changes produced in guinea pigs by deficiency of antistiffness factors and effect of ergostanyl acetate LAWRENCE W HANLON,* N CHANDLER FOOT,* JANET TRAVELL AND SEYMOUR H RINZLER * *Depts of Pharmacology and Anatomy, Cornell Univ Med College, New York City*

Twenty-one guinea pigs were maintained on a diet deficient in antistiffness factors as described by Oleson *et al* (*J Biol Chem* 171 1, 1947) The course of deficiency alone was studied in 11 animals, in 4 the diet was supplemented by wheat germ oil, and in 2 by cod liver oil The effect of ergostanyl acetate was observed in 10 pigs The daily oral dose of ergostanyl acetate in cottonseed oil was 0.03 to 0.04 mg/kg Biopsy of the triceps muscle was done on 20 pigs and autopsy on 19 Lesions in striated muscle occurred in all deficiency animals and resembled those described by Goettsch and Pappenheimer in nutritional muscular dystrophy of guinea pigs, except that in our biopsies the earliest sign of deficiency was proliferation of myoblasts, prior to non-inflammatory degeneration Calcification was seldom seen Heart muscle was not affected Wheat germ oil did not prevent either stiffness or microscopic changes Ergostanyl acetate given to 3 guinea pigs after wrist stiffness had appeared during about 90 days on the diet, produced clinical regression of muscle shortening, and changes at post mortem were much less than in comparable controls Ergostanyl acetate given to 7 animals throughout the experiment, largely prevented stiffness and microscopic changes Cod liver oil, fed to 2 pigs for 145 and 254 days, respectively, did not accelerate stiffness and may have protected against microscopic changes

Measurement of pain threshold-raising action of aspirin, codeine, and meperidine (Demerol) JAMES D HARDY* AND McKEEN CATTELL

Depts of Physiology and Pharmacology, Cornell Univ Med College, New York City

During the past 3 years, 160 medical students have been studied by the thermal radiation method in an effort to measure the pain threshold raising effects of 3 common analgesics Groups of 20 students were used in each experiment and agents were administered together with placebos so that neither the subject nor the experimenter was aware of the kind or amount of agent given The technique employed for measuring the pain thresholds was essentially the same as that used in the experiments of Wolff, Hardy and Goodell Aspirin was administered by mouth and meperidine and codeine subcutaneously in the following amounts—*aspirin*—0, 0.3, 0.6, and 0.9 gm, *meperidine*—0, 20, 25, 40, 50, 60, and 100 mg, *codeine*—0, 10, 15, 20, 30 and 45 mg Comparison of the average time-course threshold curves for each agent and dose with the placebo did not reveal any significant influence on the pain threshold measurements Certain subjects receiving aspirin or the other agents exhibited a characteristic elevation of threshold, but in others it was depressed from 10-20% It is concluded that untrained subjects, even of high intelligence, cannot be used successfully to measure the threshold raising effects of aspirin, codeine, and meperidine in the amounts given

Pyrexia in rabbits following injection of filtrates of typical mold cultures WILLIAM D HARKNESS, WALKER L LOVING AND F ALLEN HODGES (introduced by BERT J Vos) *Division of Pharmacology and Division of Microbiology, Food and Drug Administration, Federal Security Agency, Washington, D C*

Rabbits were injected intravenously with filtrates of mold cultures representing 31 species which were propagated on a dextrose-peptone medium Significant elevations in body temperature were observed in the case of 16 of these species Temperature increases varied for the numerous molds employed Temperature increases also appeared to be dependent upon the chemical constituents of the media For example, when inorganic nitrogen was substituted for peptone as a nutrient source no significant temperature rises were obtained Completely negative results from injection of portions of the several lots of media used in the study indicated that the protein or other constituents of the nutrient material were not pyrogenic prior to being inoculated with mold

Comparison of rate of uptake of radioactive thyroxine by tuber cinereum, hypophysis and thyroid EDWARD O HARPER* AND PAUL A MATTIS *Dept of Psychiatry and Pharmacology,*

Western Reserve Univ School of Medicine, Cleveland, Ohio

It has been demonstrated that the iodine concentration of the tuber cinereum and pituitary is high following the administration of thyroxine. Using the method of Horeau and Sue as modified by Gross and LeBlond, thyroxine was labeled with radioactive iodine, I^{131} . Radiothyroxine was administered intravenously ($10 \mu\text{g/kg}$) to virgin female rabbits. The total amount of radioactivity injected was $2.0-3.0 \times 10^6 \text{ dpm}$. The animals were killed by rapid i.v. injection of sodium pentobarbital. Any method bringing about a disturbed state before death vitiated the results. The concentration of I^{131} in the tissue is expressed by a ratio ($I^{131}/\text{mg organ wt}$)/($I^{131}/\text{mg body wt}$). At the end of one hour the concentration in the tuber cinereum was essentially the same as in other parts of the brain (see table), but was definitely increased at the end of 2 hours. The concentration gradually decreased during the next 22 hours. Following the 2-hour determinations, the data suggest a steady increase in the I^{131} concentration in the thyroid, with a corresponding decrease in the hypophysis during the remaining 22 hours.

$$\text{Conc} = \frac{I^{131} \text{ mg organ wt}}{I^{131} \text{ mg body wt}}$$

TISSUE	30 MIN	1 HR	2 HR	4 HR
Brain (aver)	59	51	59	39
Tuber cinereum	48	46	14	13
Hypophysis	5.02	5.87	9.95	9.90
Thyroid	3.75	13.9	12.4	29.7

Blockade of epinephrine-induced hyperglycemia

STEWART C HARVEY,* MARK NICKERSON AND KATHRYN STOVER* *Dept of Pharmacology, Univ of Utah College of Medicine, Salt Lake City*

Certain of the newer adrenergic blocking agents, notably Dibenamine and Priscoline, do not effectively block the hyperglycemic response to epinephrine. This suggests that prevention of epinephrine-induced hyperglycemia may be an expression of a pharmacological property quite different from the classical 'adrenergic blocking activity' which is usually measured as an inhibition of excitatory responses of smooth muscle to adrenergic stimuli. A systematic study of the ability of various adrenergic blocking agents to prevent the hyperglycemic response to injected epinephrine in rabbits revealed little correlation between this property and adrenergic blocking potency as measured by blockade of peripheral vascular responses. Notable discrepancies between these 2 properties include: 1) Ergonovine

in large doses blocks the hyperglycemic response although this agent is completely devoid of adrenergic blocking activity as measured against peripheral vascular and other smooth muscle responses. 2) Hydrogenation fails to significantly increase the effectiveness of various ergot alkaloids in blocking the hyperglycemic response although it markedly increases their potency in blocking smooth muscle responses. 3) Fluorenyl- and α -naphthylmethyl- β -chloroethylamines are quite effective in blocking the hyperglycemic response while their benzyl and phenoxyethyl analogues are not. All of these configurations effectively block peripheral vascular responses to epinephrine; indeed, certain phenoxyethyl derivatives are the most potent. 4) Priscoline fails to block the hyperglycemic response although it inhibits peripheral vascular and most other smooth muscle responses. It is concluded that prevention of the hyperglycemic response to epinephrine is not a reliable measure of 'adrenergic blocking activity' in the sense in which this term is usually applied.

Studies on toxicity of parathion (0-0-diethyl 0-p, nitrophenyl thiophosphate) LLOYD W HAZELTON, EMIL G HOLLAND,* AND REBECCA C HELIEMAN* *Hazellon Labs, Falls Church, Va*

Upon completion of two years' chronic feeding, rats on diets containing up to 100 parts parathion/million showed normal weight, survival and food consumption. Chemical analysis revealed no tissue storage; isolated organ weights were normal, and there was no associated pathology. As previously reported, atropine antagonizes the symptoms of acute parathion toxicity and is effective in life saving against moderate excesses of the lethal dose. Following larger doses, however, death in atropinized animals is delayed but not prevented. Adequate atropinization and manual artificial respiration are effective against these large doses in dogs. Reported nicotinolytic agents such as Parpanit (1-phenyl-cyclopentane-1-carboxylic acid hydrochloride) and Diparcol (10-(2-diethylaminoethyl)-phenothiazine hydrochloride) were not effective in either atropinized or non-atropinized animals. Metrazol effectively stimulated respiration, either before or after atropine, but the combination represented no improvement over adequate atropine and artificial respiration.

Adrenergic blockade in man by a new imidazole derivative C-7337 HANS H HECHT, R CRANDALL AND A J SAMUELS (introduced by LEO T SAMUELS) *Dept of Medicine, Univ of Utah College of Medicine, Salt Lake City*

The amino-methyl imidazoline Ciba 7337 has been tested for its sympatholytic and adrenergic blocking effects in 38 subjects. The substance was

administered intravenously in doses ranging from 0.5-1.5 mg/kg. The resting arterial pressures fell briefly to subnormal values in all subjects. All developed sinus tachycardia with T wave changes and prolongation of QT reminiscent of the effects of epinephrine in dibenamidized patients although cardiac output after C-7337 remained unchanged over the control in one subject. Nasal congestion, lacrimation, and pupillary constriction in the dark were usually present. All subjects developed orthostatic hypotension and fall in pressure exceeding the control values during the Valsalva experiment and after i.v. administration of histamine. The 'overswing' of pressures after histamine was abolished (suggesting blockade of endogenous epinephrine) but the rebound after the Valsalva test appeared unaffected. Intramuscular administration of 1 mg epinephrine given at the height of the response to C-7337 demonstrated adequate blocking of changes in arterial pressure, of epinephrine induced extrasystolic disorders, of rises in blood glucose levels and in total leucocyte counts. C-7337 failed to alter the epinephrine tachycardia, the vasoconstriction of cutaneous areas, the delayed rise in polymorphonuclear cells with lympho- and eosinopenia, and the subjective vascular and central effects of epinephrine. C-7337 possesses potent adrenergic blocking properties, appears mildly sympatholytic and may be assumed to cause local vasodilatation. Its effects are largely dissipated within 1-2 hours, and minor side effects (burning sensation, nausea, sweating, abdominal cramps and diarrhea) were frequent.

Synthetic curare compounds VII N-methyl-trilobine iodide and N-methyl-isotrilobine iodide
D. A. HERRING* AND DAVID F. MARSH *Dept of Pharmacology, West Virginia Univ School of Medicine, Morgantown*

Kondo isolated trilobine and isotrilobine from *Cocculus trilobus* and *Cocculus sarmentosus*. We have converted these biscochlorine-type alkaloids to the quaternary ammonium derivatives and compared their activity with D-tubocurarine chloride. Structurally, these trilobine derivatives are related to the berbamine compounds except the isoquinoline rings are linked by 2 ether oxygen atoms instead of only one. The trilobine derivatives are less vasodepressor in the anesthetized cat and produce less salivation and lacrimation in the trained dog than D-tubocurarine. They do not appreciably influence the cardiovascular effects of epinephrine or acetylcholine. The trilobine derivatives have a relatively greater effect on the muscles of the abdomen and thorax of the rabbit than on the neck so that the apparent safety factor in the rabbit is even less than that for D-tubocurarine, if the rabbits are maintained by mechanical respiration this effect is unimpor-

tant and 30-50 times the head drop dose is well tolerated.

Distribution and excretion of bis(5-chloro-2-hydroxyphenyl) methane HERMAN C. HERRLICH (introduced by BENEDICT E. ABREU) *Research Dept., Pitman-Moore Co., Indianapolis, Ind.*

Bis(5-chloro-2-hydroxyphenyl) methane has been shown to be an effective anthelmintic against ascarids, hookworms, and tapeworms both in combination with toluene as Vermiplex in dogs (BLAIR, H. E. *N. Am. Vet.* 30: 306, 1949), in cats (BURCH, G. R. AND H. E. BLAIR *N. Am. Vet.* in press), or used alone in dogs (CRAIGE, A. H., JR. AND A. N. KLECKNER *N. Am. Vet.* 27: 26, 1946). In addition, it has also proved to be effective against the fringed tapeworm in sheep (RYFF, J. J. F., R. F. HONESS AND H. L. STODDARD *J. A. V. M. A.* 115: 179, 1949). Since the fringed tapeworm is frequently found in the bile duct and gall bladder, this suggests that the drug is at least partially absorbed and then excreted by the liver. In order to ascertain if a cycle of excretion and reabsorption similar to that of the bile salts plays a part in the effectiveness of this drug against parasites in the biliary system and intestine, a series of determinations of the concentration of the drug in various body fluids were made. The method of Gottlieb and Marsh (*Ind. and Eng. Chem. An. Ed.* 18: 16, 1946) as adapted for use with biological materials by Johnson *et al.* (*Ann. N. Y. Acad. Sc.* 52: 518, 1949) for a similar compound was used. In view of the fact that bis(5-chloro-2-hydroxyphenyl) methane may be presumed to be conjugated with either sulfuric or glucuronic acid before excretion, an extraction and colorimetric procedure is being adapted to show the extent of these reactions at the dose level studied and data on distribution will be presented.

Absorption, excretion, and tissue distribution of three mercurial diuretics R. G. HERRMANN,* G. R. KLAHM* AND H. W. WERNER *Pharmacology Dept., Wm. S. Merrell Co., Cincinnati, Ohio*

The absorption, excretion, and tissue distribution of a new thiomercorial diuretic, TMS (trisodium salt of N[2-methoxy-3(1,2-dicarboxyethylthiomercuri) propyl]-0-carboxymethyl salicylamide), mercaptomerin sodium, and meralluride sodium were studied following intramuscular and subcutaneous administration to rats, employing doses of 7.8 to 8.0 mg/kg Hg for the 3 compounds. Analysis of 1 ml injection sites 30 minutes after administration demonstrated 94, 89, and 81% absorption of administered doses for TMS, mercaptomerin sodium, and meralluride sodium respectively. Subcutaneous absorption was found to be 79, 71, and 57% at the same time interval.

Blood levels of Hg following administration of the 3 compounds by either route were low, ranging from 4-12 $\mu\text{g/gm}$ of tissue at the 30 minute period. Mercury concentrations in heart muscle were even lower than those of blood. The mercury content of the kidneys 30 minutes after i.m. injection was 24, 30, and 31% of the administered dose for TMS, mercaptomerin sodium, and meraluride sodium respectively. Four hours after injection the kidneys contained 2, 14, and 9% TMS and mercaptomerin sodium were eliminated in the urine and feces to the extent of about 35% within 4 hours and about 86% within 24 hours after injection. After administration of meraluride sodium, about 60% was excreted in the urine and feces within 4 hours and about 90% within 24 hours.

Effects of depth of anesthesia on peripheral circulation S. G. HERSHEY* AND E. A. ROVINSKY. *Dept of Anesthesiology, New York Univ - Bellevue Med Center, New York City*

Utilizing the vascular bed of the dog omentum the effects of depth of anesthesia (ethyl ether, cyclopropane, pentothal sodium) on the peripheral circulation were observed. The peripheral circulatory mechanisms employed as criteria were 1) reactivity to epinephrine (topical), 2) venous outflow from capillary bed, 3) vasomotion of metarterioles and precapillaries, 4) terminal arteriolar caliber, 5) rate of recovery to control state. *Ether*. During light and moderate degrees of anesthesia there was some decrease in the efficiency of these mechanisms. In deep and very deep anesthesia there was marked to extensive interference with these circulatory adjustments. After clinical recovery from surgical anesthesia there was a lag of at least 20 minutes before these mechanisms reverted to the control state. *Cyclopropane*. During light and moderate depths of narcosis there was no significant change in these circulatory mechanisms. In deep anesthesia there was some diminution in their efficiency. Very deep narcosis produced a marked decrease in these circulatory adjustments. Clinical recovery from surgical anesthesia was followed by a return to the control state of these mechanisms within 2 minutes. *Pentothal Sodium*. In light narcosis no appreciable changes were observed. With moderate narcosis some alterations in the peripheral mechanisms were noted. Deep and very deep anesthesia resulted in marked to severe interference. Clinical recovery was slow but when reached was followed, in approximately 10 minutes, by a return of the peripheral circulation to the control state.

Urinary chromogen formation after exposure to aniline DAVID L. HILL (introduced by AMEDEO

S. MARRAZZI) *Pharmacology Section, Med Division, Army Chemical Center, Md*

A method has been desired which is capable of detecting exposure of animals to aniline at levels well below the toxic range for this agent. In such cases the sulfonamide reaction (BRATTON AND MARSHALL *J Biol Chem* 128: 537, 1939) applied to urines has shown promise. Urines of rabbits injected intravenously with $\frac{1}{10}$ the lethal dose of aniline showed increases in both free and total urinary chromogen of as much as 2,000% over the control values. Dogs treated cutaneously gave increases in free but not total chromogen. The urines of 15 laboratory workers were analyzed with only negligible amounts of free and labile chromogen found. Four men exposed to spreading 5 ml aniline on the forearm gave no increase in free chromogen, but 100% increase in total value. No methemoglobin or other clinical symptoms were noted. A second group of 6 men received a total of 7 ml aniline in 2 doses spread upon the thorax. Total urinary chromogen increased 200-800%. Two showed significant increases in free chromogen. Methemoglobin increases averaged 50% of total hemoglobin. All developed headache and cyanosis in varying degrees.

A study of digitoxin in blood JAMES G. HILTON (introduced by C. L. GEMMILL) *Dept of Pharmacology, Univ of Virginia Med School, Charlottesville*

Studies have been carried out on the distribution and disappearance of digitoxin in the blood of dogs. To study the distribution, varying amounts of digitoxin were added to freshly drawn oxalated blood and the mixture was centrifuged at 2100 R.P.M. for 30 minutes. The plasma was separated from the cell fraction and each portion was analysed for its digitoxin content by a polarographic method (*Science* 110: 526, 1949). It was found that all of the extractable digitoxin was in the plasma both in drawn blood and in circulating blood. The cell fraction of blood took up a constant amount of digitoxin when the digitoxin was present above a certain minimal amount. This uptake occurred whether the cells were suspended in plasma or in isotonic solution. To study the disappearance of digitoxin from the circulating blood of dogs, animals weighing between 12 and 20 kg were administered 1.2 mg of digitoxin in 50% ethyl alcohol solution by i.m. injection. At periodic intervals after injection, samples of blood were withdrawn from the jugular vein and analysed for their digitoxin content. The disappearance may be seen in the table. The values reported are average values obtained on 4 dogs and are reported in $\mu\text{g}\%$ recoverable digitoxin. If the values obtained in $\mu\text{g}\%$ are plotted against time in minutes, a curve of the form

$C = nT^a$ is obtained. The value C equals the concentration in $\mu\text{g } \%$ at time T after injection and the values ' n ' and ' a ' are arbitrary constants

CONCENTRATION OF RECOVERABLE DIGITOXIN AT VARIOUS TIMES

	TIME, MIN					
	10	20	30	60	120	240
Concentration microgram per cent	0.20	0.10	0.07	0.04	0.02	0.01

A simple spectrophotometric method for determination of tetra-ethyl thuramdisulfide (antabuse) in blood and urine CHARLES H HINE AND KSHITISH J DIVATIA * *Division of Pharmacology and Experimental Therapeutics, Univ of California School of Medicine, San Francisco*

Extraction of antabuse from whole blood, plasma or urine was accomplished by shaking 1 ml of the biologic fluid and 1 ml of phosphate buffer pH 7.4 with 10 ml of ethylene dichloride (EDC) for 20 minutes in a 15 cm glass-stoppered extraction tube. After shaking, the specimen was centrifuged, the aqueous layer removed, the EDC reshaken with 2 ml of buffer and the optical density of the EDC determined at wave lengths 285 and 320 $m\mu$ using a Beckman DU spectrophotometer. Antabuse gave a characteristic absorption curve in ethylene dichloride between wave lengths 250 and 350 $m\mu$. The absorption curve falls sharply between 285 and 320 $m\mu$, hence the difference in optical densities at these 2 points was taken as a criterion of antabuse concentration. Recovery of antabuse from old (15-day) whole beef blood and plasma averaged $85 \pm 3\%$ and $95 \pm 2\%$ respectively. Recoveries from fresh blood are much lower due to enzymatic destruction of the agent. Urine recoveries averaged $100 \pm 4\%$. The method is sensitive to about 10 μg of antabuse/ml of biologic fluid. No significant level of antabuse has been found in the blood of 12 chronic alcoholics given a daily maintained dose of 0.5 gm of the drug for from 10-90 days. Antabuse has not been detected in the blood of alcoholics receiving test doses of alcohol. There is no evidence furnished by analysis of the blood to indicate whether or not antabuse accumulates in the tissues.

Rates of calcium exchange in the system, powdered bone in calcium chloride solution HAROLD CARPENTER HODGE, ELIZABETH E UNDERWOOD* AND MARLENE FALKENHEIM * *Dept of Radiation Biology, Univ of Rochester School of Medicine & Dentistry, Rochester, N Y*
Powdered bone was exposed for various times to solutions of calcium chloride containing the

radioactive isotope. With increasing time of exposure, larger percentages of the Ca_{45} originally in the solution appeared in the bone. The rates of exchange have been computed for several calcium ion concentrations. The calcium exchange is qualitatively similar to the exchange of phosphorus as shown by P_{32} but it is necessary to assume that some quantitative differences exist. Studies have been made both on glycol-ashed bone and on fresh bone.

Veratrine-like action of alkyl ethers of 3-hydroxy-2-phenylcinchoninic acid DUNCAN A HOLADAY (introduced by E K MARSHALL, JR) *Dept of Pharmacology and Experimental Therapeutics, Johns Hopkins Univ, Baltimore, Md*

The 3-alkyloxy derivatives of 2-phenylcinchoninic acid produce strong tonic 'contractures' of the somatic musculature of all species studied (mouse, rat, guinea pig, rabbit, cat, dog). The effect involves all skeletal muscles responding to centrally initiated stimuli, but is most prominent in the hind quarters. On the isolated rat diaphragm-phrenic nerve preparation the effect was demonstrated to be directly on the muscle fiber, a typical veratrine-like myogram results from direct stimulation of the fully curarized preparation. Like the contracture produced by veratrine, the effect may be relieved by exercise ('warm-up'), by drugs having quinidine-like action, and by calcium ion. The potency of the straight chain series decreases with increasing length of the alkyl chain, the methoxy compound being most potent, and the hexyloxy derivative being devoid of demonstrable activity. 3-Amino-2-phenylcinchoninic acid also possesses this property.

Studies on permeability effect of physostigmine and acetylcholine on permeability of rabbit, cat and dog erythrocytes to sodium and potassium W C HOLLAND* AND MARGARET E GREIG *Dept of Pharmacology, Vanderbilt Univ School of Medicine, Nashville, Tenn*

We have previously reported that inhibition of cholinesterase activity by physostigmine causes changes in permeability of dog erythrocytes as determined by hemolysis (*Arch Biochem* 23 370, 1949). We have also found that selective permeability of erythrocytes of dogs and other mammals to Na and K appears to depend on the activity of the acetyl choline cholinesterase system. Two groups of cells have been investigated. I) Dog, Cat, with a high Na and low K, II) Rabbit, with a high K and low Na. When washed cells of a species of group I was placed in a KCl-K bicarbonate medium, K entered the cell quite rapidly as would be expected in a non-living membrane, and the cell hemolyzed. When, however, acetyl choline was added to the medium the entrance of K was much delayed and the cell remained intact.

for a longer period of time. If physostigmine were added along with acetyl choline so that cholinesterase activity was inhibited by 40-80% the entrance of K again becomes rapid, the results being similar to those observed when no substrate was present. In the case of cells of group II the same picture was obtained when these cells were placed in a Na medium—in this case the Na ion entered the cell rapidly in absence of acetyl choline or when metabolism of acetyl choline was inhibited by physostigmine, but the integrity of the cell was maintained over a much longer period if the cells were able to metabolize acetyl choline.

Use of thermistors in twin calorimetry for enzyme reactions F C HOLLER,* D VENABLE* AND C L GEMMILL Dept of Pharmacology, Univ of Virginia Med School, Charlottesville

Thermistors, which have a sensitivity of about 10 times that of Beckmann thermometers, have been used in twin calorimeters designed for thermochemical and kinetic studies of enzyme reactions. The calorimeters were mounted in a water bath constant to $\pm 0.001^\circ \text{C}$. The calorimeters were calibrated for thermal flow effects by passing a known amount of current through a resistance mounted in each calorimeter. A special constant current electronic circuit was constructed for this purpose. This circuit was used also to obtain the heat capacities of the calorimeters and contents. Sucrose inversion with hydrochloric acid was carried out at 31.2°C . The temperature changes were observed over a period of 4 hours. The heat of reaction was calculated by Sturtevant's method (*J Am Chem Soc* 59 1528, 1937). It was found to be $-15,074$ joules/m. This agrees very well with Sturtevant's observed value of $-15,020$ joules/m. Therefore, thermistors in twin calorimeters can be used as a method of determining the heat production of chemical and enzymatic reactions.

Responses of growth of penicillia to cardiotonic glycosides JAMES P HOLLOWAY* AND JAMES C RICE Dept of Pharmacology, Univ of Mississippi School of Medicine, University, Miss

The observation that infusion of digitals increased both the rate of growth and the terminal weight of dried mycelial mats of *Penicillium notatum* and *Penicillium citrinum* growing in surface culture at 23°C in otherwise minimal solution (Clutterbuck's) led to experiments to test the hypothesis that the cardiotonic glycosides were responsible for the observed effects. Graded increasing concentrations of Deacetyldigilaid A and Deacetyldigilaid C ($1 \mu\text{g/ml}$ to $10 \mu\text{g/ml}$) not only failed to accelerate growth of *Penicillium notatum* but actually retarded it. The 3 digilaidins in graded increasing concentrations ($1 \mu\text{g}$ to 10

$\mu\text{g/ml}$) produced similar results. When ample time was permitted for completed growth the 5 glycosides tested had no effect on terminal weight of dried mycelial mats. Fragmentary evidence gained with *Penicillium citrinum* followed much the same pattern as above. None of the agents employed conduced to pH relations of the cultures or antibiotic titers (Oxford Cup Method) differing impressively from those expected for minimal media. Rate of growth was determined by killing, drying, and weighing mycelial mats on each of 5 consecutive days beginning on the 4th or 5th day after inoculation with homogenized spore suspensions, by plotting the average weights of the mats as ordinates against abscissa, time, and by comparison of slopes of curves, and heights of ordinates at fixed time, with those for controls. For effects upon total weight the mats were dried, weighed, and the weights averaged terminally. Results with alcohol-water dispersates of ouabain, digitoxin, and strophanthin were ambiguous.

Curarimimetic activity of mono- and bis-(amino and ammonium-alkylamino)-benzoquinones J O HOPPE, A E SORIA AND C J CAYALLITO (introduced by A M LANDS) Sterling-Winthrop Research Inst, Rensselaer, N Y

The curarimimetic activity of a series of 2,5-bis-(ammoniumalkylamino)-benzoquinones in which the distance between quaternary nitrogen atoms ranged from 11\AA to 20\AA was found to be similar to that of D-tubocurarine chloride in the mouse but from one-half to five-fold that in the rabbit. The more active compounds were examined by means of the nerve-muscle preparation in the dog 2-(Ammoniumalkylamino)-benzoquinones were as active as the bis derivatives. The activity depends on the presence of the iminoquinone structure as well as the onium group. Considerable activity was observed in mice with the corresponding 2- and 2,5-aminoalkylamino-benzoquinones. Distances between basic nitrogen atoms in the bis series and between basic nitrogen and iminoquinone structure in the mono series were critical factors determining activity. With these amines, activity increases with increase in basicity of the terminal nitrogen atoms. One of the most active compounds in the series was 2,5-bis-(3-diethylaminopropylamino)benzoquinone bis-benzylchloride (WIN 2747) which was 5 times as active as D-tubocurarine chloride in the rabbit, one-half as active in the mouse and twice as active in the dog nerve-muscle preparation. WIN 2747 had little or no effect on blood pressure or heart rate and had no severe cardiotoxic effect by continuous infusion into anesthetized dogs at dosages up to 1500 times the curarizing dose.

Antibiotics against natural amebiasis in macaques ARSENY K HRENOFF* AND HAMILTON

H ANDERSON *Division of Pharmacology and Experimental Therapeutics, Univ of California School of Medicine, San Francisco*

A combination of 3 antibiotics, polymyxin B, streptomycin and bacitracin exhibited synergism when tested *in vitro* against *E histolytica* (see M GOULD AND E L HANSEN, current *Proceedings*) Because of possible value in the chemotherapy of amebiasis 10 monkeys were given varying oral doses of the combination over 5-6 day periods. The drug was administered in tablets which contained polymyxin B, 20 mgm, streptomycin (as base), 250 mg, and bacitracin, 5,000 units each. Two animals received only $\frac{1}{2}$ of these doses/kg. They failed to clear of amebas. One of these animals, given twice this dose, was ameba free for 2 weeks. Five animals were given from $\frac{1}{2}$ to $\frac{3}{4}$ these doses/kg. One monkey was cleared for 4 weeks. The doses were doubled and the animal remained free of amebas for another 4 weeks (to date). Another animal was freed of amebas for 10 weeks (to date). The remaining 3 monkeys were not cleared until 10 days elapsed after therapy. They have stayed free of parasites for 3 weeks (to date). Of the remaining 3 macaques, receiving $\frac{1}{2}$ to $\frac{3}{4}$ the initial doses/kg, one was freed of amebas for 11 weeks (to date), the other was freed for 5 weeks (to date), and the third failed to clear. Without exception all animals tolerated this regime, all gained up to 10-18% their initial weight, their appetites increased, and stools changed from liquid or semi-liquid to solid. The hemoglobin, leucocytes, erythrocytes, bromsulphalein and blood urea tests and electrocardiograms exhibited no toxic effects. The stools have been studied almost daily by iron-hematoxylin technic. Thus, 7 of 10 animals have been cleared of pathogenic parasites and signs of amebiasis over 3-11 weeks.

Cause of increasing intravenous toxicity of hydrogen peroxide with progressive dilution M CAROLINE HRUBETZ, LILLIAN W CONN, HYMAN R GITTES AND JAMES K MACNAMEE (introduced by AMEDEO S MARRAZZI) *Toxicology and Pathology Sections, Med Division, Army Chemical Center, Md*

Studies of the intravenous and percutaneous toxicity of 90% hydrogen peroxide have shown that death is associated with gas embolism and that this is probably the immediate cause. With *iv* injection, the toxicity in rabbits is predictably increased with the dilution. For example, the LD_{50} for undiluted was 15 cu mm, for 40%, 8.9 cu mm, and for 4%, 3.2 cu mm. In casting about for a plausible explanation for this finding our studies with percutaneous administration suggested that, grossly, the greater the local reaction, the lower the toxicity. The effect is initially due

to the liberation *ic*, *sc*, and *im*, of oxygen. This suggests that less of the administered material is therefore available for the production of gas emboli in the blood stream and would account for the lower toxicity on an embolic basis. In fact, when the agent is injected *iv* in the rabbit's ear, it is apparent that the more concentrated the form, the greater the breakdown within the immediate area as evidenced by the peculiar and characteristic blanching due to gas bubbles entrapped in the surrounding tributary vessels and adjacent tissue.

Experimental addiction to barbiturates (motion picture) HARRIS ISBELL, SOL ALTSCHUL,* C H KORNETSKY,* H F FRASER,* H G FLANARY,* A J EISENMAN, A WIKLER AND HARRIS HILL* *Research Division, USPHS Hospital, Lexington, Ky*

Five former morphine-addict volunteers received barbiturates for 92-144 days. The highest daily dosages attained were 1.8, 1.8, and 3.8 gm daily of seconal, pentobarbital, and amytal respectively. While chronically intoxicated, all patients showed impairment of mental ability, increased emotional lability, infantile behavior and confusion. No toxic psychoses were observed while patients were taking the drug. Neurological signs included nystagmus, dysarthria, ataxia in gait and station, and depression of superficial abdominal reflexes. The effects of the same dose of the drug varied widely from day to day and was partially dependent on food intake. Partial tolerance was observed. In the electroencephalogram the percentage of β waves was increased. Following withdrawal of barbiturates, neurological signs disappeared and weakness, anxiety, anorexia, nausea, vomiting, rapid weight loss, fever, elevation of NPN's, convulsions (4 of 5 patients) and a psychosis (4 of 5 patients) resembling alcoholic delirium tremens were observed. During withdrawal, the percentage of β waves was reduced in the electroencephalogram and paroxysmal bursts of slow waves appeared. Recovery was complete.

Influence of age on metabolic rate and phosphate compounds of cardiac muscle JO'ANN JEHL AND ALBERT WOLLENBERGER (introduced by OTTO KRAYER) *Dept of Pharmacology, Harvard Med School, Boston, Mass*

On incubation in Krebs-Ringer-phosphate glucose solution, slices of cardiac ventricular muscle of new-born guinea pigs respire at a more or less constant rate, whereas the rate of respiration of ventricular muscle slices of guinea pigs 3 weeks to 30 months old declines 30-50% over a period of 30-45 minutes before reaching constancy. The Q_{O_2} characteristic of the steady state of activity diminishes with advancing age. The following

values, based on the combined dry weight of slices and trichloroacetic acid precipitate in the medium, were obtained 4-5 at birth, 3-4 at 3 weeks, 2.5-3 at 5 months, and ~2 at 30 months of age. The Q_{O_2} is usually maintained for several hours at or near these levels in the heart slices of the younger animals, but in the tissue of the 30 month old animals it falls to below 1 after 2 hours. 10^{-6} M ouabain, which in cardiac muscle of 5 and of 30 month old guinea pigs causes marked acceleration of respiration followed by severe inhibition, produces only moderate changes in the myocardium at the age of 3 weeks, and exerts no significant effect on the respiration of myocardium of new-born guinea pigs. Analyses of some acid-soluble phosphates, including ATP, and of creatine in the cardiac ventricles of guinea pigs ranging in age from a few hours to 30 months revealed two pronounced changes related to age: a 200% increase in phosphocreatine from the time of birth to the age of 11 months, half of which occurs during the first 3 weeks, and a 100% increase in total creatine during the same 11 month period. At birth ~1/3 of the total creatine in the ventricles is phosphorylated, in the ventricles of animals 3 weeks to 30 months old the phosphorylated fraction amounts to almost 1/2 of the total creatine. The possible significance of these findings is discussed.

Water and electrolyte equilibria factors in fluoroacetate poisoning LINARES B. JOHNSON,* ALEXANDER KANDEL* AND MAYNARD B. CHENOWETH
Dept of Pharmacology, Univ of Michigan, Ann Arbor

Disturbances of certain physiological and biochemical balances result in an altered response to sodium fluoroacetate (FA). Shifts in intracellular water and electrolytes can either increase or decrease the sensitivity of animals to FA depending on the direction of movement. This was first observed in experiments with albino Sprague-Dawley rats. Male animals were dehydrated for seven days. One group was given 20 mg/kg of FA intraperitoneally, the remaining group was allowed water for a period of 4-5 hours and then injected with the same dose of FA. Sixty-four control rats receiving 20 mg/kg showed an average time to death of $231 \pm S.E. 22$ minutes as compared to $78 \pm S.E. 11$ minutes for 60 dehydrated rats. Eighty-nine dehydrated animals which subsequently received water manifested an increased resistance to FA. As compared to no survivals in the control group beyond 15 hours, 27 (30%) of these rats lived for more than 24 hours after injection. In contrast, 66 rats following 7 days of fasting, but allowed water *ad libitum* responded in the same manner as controls to 20 mg/kg of FA and died in an average time of 255

$\pm S.E. 26$ minutes. Preliminary experiments indicate that these phenomena are also demonstrable in rabbits, in which FA produces fibrillation, and to a lesser extent in dogs, in which, like rats, FA has a convulsant action. These and other experiments related to electrolyte balance will be reported.

Effects of certain enzyme inhibitors on breakdown of pentobarbital *in vitro* J. B. KAHN, JR (introduced by J. M. COON) *Dept of Pharmacology, Univ of Chicago, Chicago, Ill*

Following studies on effects of ions on destruction of pentobarbital by rat liver slices (KAHN, J. B. *Federation Proc.* 8: 305, 1949), it was decided to investigate effects of certain factors known to influence enzymatic equilibria on *in vitro* destruction of pentobarbital. Slices of rat liver approximately 0.5 mm thick were placed in a cylinder containing 49.0 ml of oxygenated Krebs-Ringer phosphate with glucose and maintained at 37°C. Three mg of pentobarbital was added in 1.0 ml Krebs-Ringer phosphate, and the concentration of pentobarbital determined spectrophotometrically at 0, 60, and 120 minutes. Control tests were performed similarly, using boiled tissue slices. Effects of the following compounds were studied: cyanide, fluoride, arsenite, iodoacetamide, glutathione, and cysteine. Cyanide and fluorid ($10^{-3}M$) had no effect. In the absence of a -SH inhibitor, destruction in the boiled slices was approximately 10% of that in the unboiled. Iodoacetamide or arsenite ($10^{-3}M$) permitted normal destruction in the unboiled slices, but also caused destruction in boiled slices which was 75% of that in the unboiled. When the same experiment was performed without added tissue there was no removal of barbiturate, so results noted are not due to direct combination of barbiturate and inhibitor. When -SH groups as reduced glutathione or cysteine were added to the system containing unboiled slices, destruction of pentobarbital was inhibited approximately 60%. From this evidence the hypothesis is advanced that -SH groups inhibit the *in vitro* destruction of pentobarbital by rat liver slices.

Effects of methyl bis (β -chloroethyl) amine (nitrogen mustard) on regeneration and alkaline phosphatase activity of urodele larvae forelimbs ALEXANDER G. KARCZMAR AND GEORGE G. BERG (introduced by CHARLES F. MORGAN) *Dept of Pharmacology and Materia Medica, Georgetown Univ School of Medicine, Washington, D. C.*

Inhibitory effect on regeneration of amputated larval urodele forelimbs can be used to test anti-mitotic activity of chemical agents (KARCZMAR *Anal. Rec.* 101: 712, 1948). With effective anti-mitotics regeneration blastema is never formed and complete regression of amputated limbs en-

sues Accordingly, a test was devised to measure drug activity by means of photographing periodically the regressing limb and computing the regression rates Histology or mitotic counts are thus unnecessary for screening these agents The test shows also the regressive effect of denervation of amputated limbs which can be used as reference unit, with regression rates of 3μ and $1 \text{ cu } \mu/\text{hr}$ Nitrogen mustard causes a much slower regression with chronic exposures to concentrations of 50% of LD_{50} (1 150000) and similar regression ($3 \mu/\text{hr}$) recorded over 2-weeks period after single exposures for less than 1 hour to strong (1 5000) nitrogen mustard solutions Combination of denervation and chronic exposure to nitrogen mustard solutions (1 200000) caused regression of amputated limbs twice as rapid as that following denervation alone Preliminary histochemical investigation showed that nitrogen mustard blocks the formation of epidermal alkaline phosphatase which precedes normal regeneration However, it enhances phosphatase activity in regressing mesodermal tissues The effect of nitrogen mustard on phosphatase activity is specific and differs from that of denervation Since mitotic inhibition by nitrogen mustard or by denervation alone is almost complete, their synergism indicates a more complex causation of regression, mitotic activity being only one of the contributing factors

The effect of adrenal steroids on growth of chick embryo D A KARNOFSKY, C C STOCK AND C P RHOADS (introduced by F S PHILIPS)
Division of Experimental Chemotherapy, Sloan-Kettering Inst for Cancer Research, New York City

It had been previously shown that an extract of the adrenal cortex would retard the growth of the chick embryo (LANDAUER, *Endocrinology* 41 489, 1947) In the course of our cancer chemotherapy studies, the effect of various pure steroids in aqueous solution or in propylene glycol were examined by injecting them into the yolk sac of the 4-day-old chick embryo Compound E, at a critical dose of 1-2 mg/egg, produced a marked decrease in the growth of the chick embryo This was manifested by reduction in the formation of the chorioallantoic membrane and a stunted embryo, which was often eviscerated, and showed scanty and abnormal feather formation These embryos usually died 6-8 days after injection, but some survived to 18 days, and weighed 4-6 gm as compared to 18-21 gm for the controls The stunted embryo was well-proportioned, and the egg contained a large amount of unused yolk and albumen as compared to the controls Compound F had a similar effect, but, in preliminary studies, it appeared to be 20-40 times more active than Compound E in the chick embryo A number of

other steroids is being assayed for their 'compound E' activity in the chick embryo, in order to elucidate the chemical structures necessary for this effect

Clinical evaluation of two new analgesics, heptazone and WIN 1161-2 as a test of a new method of measuring analgesic power ARTHUR S KEATS* AND HENRY K BEECHER
Anesthesia Lab of Harvard Med School at Massachusetts General Hospital, Boston

Two new synthetic analgesics of the methadone series, DL-4,4-diphenyl - 6 - morpholino - heptanone-3 hydrochloride (Heptazone) and levo 3-dimethylamino-1,1-diphenylbutyl ethyl sulfone (WIN 1161-2) were tested for analgesic potency in postoperative pain of man The analgesic activity of different dose levels was compared to that of 10 mg of morphine/150 lb of body weight in the same group of patients This was accomplished by alternating doses of morphine between doses of the drug to be tested in the same patients Neither patients nor observers were aware of which drugs were given Heptazone when given as 50-60 mg/150 lb of body weight relieved pain as frequently as 10 mg of morphine WIN 1161-2 was found to be erratic in action and unsuitable for clinical use The method used in this evaluation is presented in detail elsewhere Its accuracy and consistency were demonstrated by evaluating morphine itself when treated as an unknown The method's use in determining the analgesic potency of new drugs is demonstrated here

Pain relief with hypnotic doses of barbiturates ARTHUR S KEATS* AND HENRY K BEECHER
Anesthesia Lab of Harvard Med School at Massachusetts General Hospital, Boston

It was observed (BEECHER) in badly burned patients and later in men suffering from war wounds that small doses of barbiturates appeared to be useful in relieving pain These findings led to the present controlled study in which the data obtained demonstrate the analgesic power of hypnotic doses (60 and 90 mg/150 lbs body weight) of pentobarbital sodium This analgesic power has been compared with that of a placebo (1 cc normal saline) and a standard dose of morphine (8 mg/150 lbs body weight) in the same patients The order of administration was randomized in accordance with sound statistical practice The agents were administered intravenously All drugs were dealt with as unknowns both to the patient and the observer The subjects were 175 postoperative patients in pain They were studied during the 18th to the 30th hour following surgery The pain experience of man consists of both perception of painful stimuli and the psychic modification of these stimuli We wish to emphasize the importance of utilizing subjects in pain

from disease or from surgery rather than experimentally produced pain in the assay of analgesic power. Hypnotic doses of pentobarbital sodium administered intravenously relieves postoperative pain in 50% of patients in contrast to 20% with saline and about 80% by morphine.

Pharmacology of khellin KEITH F. KILLAM* AND EDWIN J. FELLOWS *Research Division, Smith, Kline and French Labs., Philadelphia, Pa.*

Khellin (2-methyl-5,8-dimethoxyfuranochromone), one of the major crystalline components of *Annu Visnaga Lam.* has been reported (ANDEREF, *et al.*) to exhibit smooth muscle relaxing activity with some degree of specificity for the coronary vessels. In the present experiments a modified Langendorff technique was used to determine the effect of khellin on isolated rabbit hearts perfused with oxygenated Locke's solution. Khellin was administered over a 2-minute interval in order to simulate recirculation which would occur in an intact animal and also to obtain reproducible results. The rate of injection was proportional to the rate of perfusion fluid flow. The 2-minute period immediately prior to each test period served as a control. The percentage change in perfusion flow was calculated by the following formula: $\text{Change in flow (cc) during test} / \text{Flow in cc during control period} \times 100$. In 157 experiments concentrations of 1, 100,000 khellin produced an average increase in perfusion fluid flow of 32%. An average of 67% was noted after 1, 10,000 khellin in 67 experiments. In anesthetized, heparinized dogs, normal and changing blood flow was determined by inserting a glass cannula into a convenient superficial coronary vein and the outflow measured by a circuit-breaking graduated tilt cup or drop recorder. In 8 of 11 experiments, 2.0, 3.0 and 5.0 mg/kg of khellin intravenously produced a significant increase in coronary flow. After 2.0 mg/kg khellin caused an increase of 20-88% for 2-20 minutes, after 3.0 mg/kg, an increase of 49-100% for 28 minutes to one hour, and after 5.0 mg/kg an increase of 75-230% for periods of 1½ hours which was the duration of the experiments. In all experiments, khellin produced a moderate fall in blood pressure which returned to normal in 2-4 minutes.

Rapid technique for statistical evaluation of 3, 4 or 5 dose assays LILA F. KNUDSEN (introduced by BERT J. Vos) *Division of Food, Food and Drug Administration, Federal Security Agency, Washington, D. C.*

Assays involving percentage responses with equal numbers of animals on 3 to 5 or more doses on each of the standard and the unknown can be rapidly evaluated using the angular transformation to obtain estimates of potency, and standard error of the assay. Where routine labora-

tory assays are conducted on a relatively large scale, it is possible to plot the slopes of the individual dosage-response curves over a period of time. If these slopes are in 'statistical control' (relatively constant within sampling errors), the best estimate of the slope is the average. When the control chart technique is thus used on the slopes, it is possible to construct one graph from which can be read estimates of potency, upper and lower confidence limits for the assay from the simple calculation of 2 values V and W . Assays involving graded responses with equal numbers of animals on each of 3 to 5 (or more) doses on each of the standard and unknown can be evaluated by relatively the same technique by substituting the 'range' for the standard deviation in the proper formulas.

Role of specific and non-specific cholinesterase in spontaneous contractions of isolated ileum

GEORGE B. KOELLE, ETHOL S. KOELLE* AND JONAS S. FRIEDENWALD* *Wilmer Ophthalmological Institute, Johns Hopkins Univ. and Hospital, Baltimore, Md.*

Histochemical studies have revealed that both specific and nonspecific cholinesterase (ChE) are widely distributed throughout the ileum of the cat, the latter was found in both the muscle fibers and in the ganglion cells of the plexus. These observations suggested that nonspecific ChE might play a role in the transmission of impulses at these sites similar to that generally ascribed to specific ChE. To investigate this possibility further, the effects of varying concentrations of di-isopropyl fluorophosphate (DFP) have been tested on the spontaneous activity of isolated ileum preparations. Afterwards, the preparations were washed in saline and homogenates and frozen sections were prepared to permit quantitative determinations of the degrees of inhibition of both types of ChE and microscopic studies of their residual distributions. It was found that concentrations of DFP producing slight inhibition of specific ChE but relatively marked inhibition of the non-specific esterase caused a definite increase in both the tonus and amplitude of spontaneous contractions.

Antioxidant and stabilizing action of propylene glycol THEODORE KOPFANYI *Dept. of Pharmacology and Materia Medica, Georgetown Univ. School of Medicine, Washington, D. C.*

Solutions of epinephrine hydrochloride in pure propylene glycol or in from 60 to 70% aqueous solutions of propylene glycol are protected from oxidation. In accelerated tests where epinephrine hydrochloride (1:1000) is treated with 1 cc. of 3% hydrogen peroxide, the glycol prevents to a great extent the red discoloration of epinephrine, even when the mixture is heated for 10 minutes at a

temperature of 70°C Commercial samples of epinephrine (1 10,000) exposed to air when kept at a temperature of 15°C develop red color after 67 hours, whereas when kept in propylene glycol, the reddish tinge appears only after 23 days Other glycols are less effective Propylene glycol also protects epinephrine solutions in the presence of liver slices Propylene glycol inhibits the decomposition of other drugs such as apomorphine, physostigmine, "Clorarsen" and arsphenamines In a number of dogs, it was found that the i.v. injection of from 0.5 to 1 cc. of propylene glycol/kg. in diluted form potentiates the pressor effects of epinephrine both as to height and duration This glycol in similar doses, may also produce a slow, gradual rise of blood pressure in dogs with arterial pressures at shock levels

Action of epinephrine and veratramine upon heart rate and oxygen consumption in heart-lung preparation of dog KURT KRAMER,* ULRICH LUFT* AND OTTO KRAYER *Dept of Pharmacology, Harvard Med School, Boston, Mass., and School of Aviation Medicine, Randolph Field, Tex*

In 9 heart lung preparations on dogs, the influence of epinephrine and veratramine upon oxygen consumption and heart rate under constant conditions of work were studied After a control period of 30 minutes when the oxygen consumption, heart rate and coronary blood flow had reached constant values, L-epinephrine in doses of 1.5 to 7 $\mu\text{gm}/\text{min}$ were infused over a period of 1-2 hours While the heart rate rose to 95% of its maximum within 4-10 minutes the increase in oxygen consumption of the heart progressed much more slowly, in some cases reaching its maximal value only after one hour During the subsequent steady state each heart beat consumed 30-40% more oxygen than during the previous control period Regardless of the inhibition of epinephrine cardioacceleration, veratramine, injected in successive doses of 100, 200 and 700 μgm , did not change the oxygen demand of each beat Only after eliminating the epinephrine by flushing the system with fresh blood could the oxygen consumption per beat be reduced to its initial value or below Repetition of the epinephrine infusion augmented the oxygen consumption as before but without cardioacceleration due to the persistence of the veratramine effect Previous investigations indicated that the positive chronotropic action of epinephrine can be separated from its positive inotropic action by use of veratramine According to results of the present study cardiac metabolism under epinephrine appears to be as little affected by veratramine as the force of contraction Since it is thus possible to discriminate between accelerator and metabolic action

of epinephrine, further investigations may throw light on the relationship between force of contraction and cardiac metabolism

Solanum alkaloids with antiaccelerator cardiac activity OTTO KRAYER *Dept of Pharmacology, Harvard Med School, Boston, Mass*

Solasodine and several of its hydrogenation products, notable β -dihydrosolasodine and tetrahydrosolasodine, were found to possess an antagonistic action to the positive chronotropic effect of epinephrine which is obtainable also in the isolated mammalian heart under atropine These solanum alkaloids are similar in this regard to the veratrum alkaloids, veratramine and jervine Like these veratrum alkaloids, they are secondary amine bases of steroid nature β -dihydrosolasodine and tetrahydrosolasodine are intermediate in potency to veratramine and jervine, while solasodine is weaker than jervine The substances used in this study were made available by Prof. L. H. Briggs of Auckland Univ. College, New Zealand

Inhibition of succinic dehydrogenase by methylglyoxal A regulatory mechanism of sulfhydryl enzymes ERNEST KUN *Dept of Medicine, Division of Infectious Disease and Dept of Biochemistry, Tulane Univ., New Orleans, La*

The succinate system of isolated rat liver mitochondria was measured by 3 methods: 1) using the cytochrome system as electron carrier to molecular oxygen, 2) with ferricyanide and 3) with triphenyltetrazolium chloride as electron acceptors Since enzyme activity in each system was equally inhibited in the presence of methylglyoxal, it is concluded that the dehydrogenase is inhibited Cytochrome oxidase is unaffected The inhibition rapidly increases with length of incubation, approaching 100% after 30 minutes The presence of substrate somewhat delays inhibition, however does not protect the enzyme The type of inhibition is non-competitive, and the mechanism of inhibition consists of the reaction of methylglyoxal with the -SH of the dehydrogenase This was shown by direct determination of -SH groups of mitochondria The decrease in -SH, after incubation with methylglyoxal, corresponds with the decrease in enzyme activity Incubation of the inhibited enzyme with glutathione, or repeated washing of inhibited mitochondria does not reverse the methylglyoxal effect Glyoxalase (present in total liver homogenates) does not counteract the inhibition by methylglyoxal, but glyoxalase plus glutathione has a protective effect against the inhibitor Since other -SH enzymes (malic-, glutamic-, triose dehydrogenases, and ATP-ase) are also inhibited by methylglyoxal, it is suggested that the methylglyoxal-glyoxalase-

glutathione system plays an important role in the regulation of -SH enzymes

Storage of methoxychlor in the fat of the rat

FRIEDA M. KUNZE,* EDWIN P. LAUG AND CLAUDIA S. PRICKETT* *Division of Pharmacology, Food and Drug Administration, Federal Security Agency, Washington, D. C.*

Comparative acute and chronic studies have indicated that methoxychlor is considerably less toxic to rats than DDT. These studies were made to determine to what extent methoxychlor is stored in the fat, liver and kidney. Following exposure of weanling rats to diets containing 25, 100 and 500 p.p.m. methoxychlor for from 4 to 18 weeks, there was found 1) at the 500 p.p.m. level of methoxychlor in the diet, storage of the order of 30 p.p.m. in the fat, but essentially no storage at 25 and 100 p.p.m. dietary levels, 2) in contrast to DDT, no clearly defined tendency of the female to store more methoxychlor in the fat than the male, 3) minimal storage of methoxychlor in liver and kidney tissues, 4) no increase of storage of methoxychlor in fat after the first 4 weeks of exposure, 5) disappearance of stored methoxychlor from fatty tissue within 4 weeks after cessation of exposure.

Effect of hypoadrenalcorticoidism and excessive doses of desoxycorticosterone acetate and thyroid upon response of rat to cardiac glycosides

HERBERT S. KUPPERMAN* AND ARTHUR C. DEGRAFF *Dept. of Therapeutics, New York Univ. College of Medicine, New York City*

The string galvanometer (Cambridge) with suitable modifications has been employed in obtaining electrocardiograms in the rat. The modifications include acceleration of the rate of speed of passage of photographic paper through the camera and use of electrodes comprised of 30-gauge copper wire. Animals were anesthetized with sodium pentobarbital. Hypoadrenalcorticoidism, induced by adrenalectomy, was associated with decreased voltage in the electrocardiogram and increased sensitivity of the rat to i.v. injections of ouabain or digitoxin. Doses of the glycosides that produced minimal effects in intact control rats caused A-V dissociation, bundle branch block, marked slowing of the ventricular rate and cardiac arrest in some of the adrenalectomized animals. Desoxycorticosterone (DCA) administration on the other hand resulted in increased resistance of the rat to administration of doses of the cardiac glycosides which produced marked effects in normal untreated control rats. Ascites and anasarca associated with cardiac hypertrophy induced by chronic and simultaneous administration of high doses of DCA, 0.1% thyroid in the food, 0.9% saline in the drinking water, was ameliorated by

the i.v. injection of a rapid acting glycoside into these rats. A marked diuresis occurred following intravenous administration of ouabain. This was accompanied by a decrease in extent of ascites and venous engorgement.

Local vs systemic emetic action of digitalis

glycosides in man. NATHANIEL T. KWIT,* WALTER MODELL AND HARRY GOID *Dept. of Pharmacology, Cornell Univ. Med. College, Cardiovascular Research Unit of the Beth Israel Hospital, and the Cardiac Service of the Hospital for Joint Diseases, New York City*

When digitalis or its glycosides are administered orally in repeated doses in man until marked action on the heart is in evidence, the nausea and vomiting which may follow are almost invariably ascribed to a systemic action. In a report of animal experiments presented here last year, doubt was cast on the foregoing assumption, since small oral doses of glycosides in cats often produced vomiting 8 to 10 hours later, when assay showed none of the glycosides in the body. If this were to apply to man, the vomiting which usually occurs would constitute not only a protection against serious poisoning, but also a bar against the most effective therapeutic results. An unusual opportunity to test this formulation presented itself in a patient with an extremely resistant auricular flutter. This report concerns the observations in this case during a period of 3 months. During the first month (oral doses), the ectopic rhythm was abolished 3 times, but each time nausea and vomiting preceded the cardiac effect by 2 to 4 days. In the remaining period (intramuscular), the ectopic rhythm was abolished 5 times, each time without gastrointestinal symptoms. These results indicate that a higher degree of cardiac action is possible by parenteral than by oral administration, without gastrointestinal symptoms. Results support the position that vomiting after digitalis materials, which is usually ascribed to a systemic action, may be a local gastrointestinal action. In view of the importance of this observation, a more extensive project to test this question further is in progress.

Potentiating effect of glucose and its metabolic products on barbiturate anesthesia

P. D. LAMSON, MARGARET E. GREIG AND B. H. ROBBINS *Dept. of Pharmacology, Vanderbilt Univ. School of Medicine, Nashville, Tenn.*

We have found that glucose has a very definite potentiating effect on barbiturate anesthesia in certain species of animals. This varies in intensity in dogs, is not present in rats, but is very marked in guinea pigs and definite in hamsters and rabbits. Certain of the decomposition products of glucose metabolism as hexose diphosphate, lac-

tate, pyruvate, succinate and fumarate, as well as malonate and the water extract of both brewers' and bakers' yeast, produce the same effect, some more strongly than glucose. No such effect is obtained with sucrose. This potentiation seems confined to barbiturates. It was absent in ether, chloral and chloralose anesthesia. A simple way in which to observe this potentiation is to give a guinea pig 0.25 ml/100 gm of a 2% hexobarbital solution intraperitoneally. The pig will sleep for about 45 minutes. When definitely awake, but before it can walk, inject 2 ml or less of 50% sodium lactate (Mallinckrodt) and the pig will immediately go into deep sleep and anesthesia. Neither glucose nor its decomposition products alone have any anesthetic effect.

Effects of alterations of the pH of the blood on dynamics of the circulation KURT LANGE, FRANK GRAIG, DAVID WEINER AND VICTOR TCHERTKOFF (introduced by M. G. MULINOS), *Dept of Medicine, New York Med College, New York City*

Intravenous infusions of gluconic acid or acid sodium phosphate solutions were given to dogs on artificial respiration. The resultant lowering of the pH of the blood leads to a marked reduction in peripheral resistance without lowering of the blood pressure until very low pH values are reached. Up to this point a compensatory increase in minute output occurs, accomplished by a marked increase in stroke volume and in spite of a slowing of the pulse rate. Generalized vasoconstriction with resultant increase in peripheral resistance induced by hypothermia can be effectively reduced by acidification. The shock-like picture in diabetic or uremic coma is probably explained by this mechanism.

Effect of certain compounds on biological inactivation of epinephrine EDWARD LARSON AND JOSEPH P. ADAMS, JR * *Dept of Physiology and Pharmacology, Univ of Miami, Medical Research Unit at the Veterans' Hospital, Coral Gables, Fla*

Since the biological inactivation of epinephrine might be influenced either by compounds having a similar structure or certain groups in common, hydroxy compounds such as catechol, phenol, resorcinol, hydroquinone etc were injected simultaneously with definite doses of epinephrine into anesthetized dogs. The effects of these compounds on the actions of epinephrine considered, i.e. rise of the arterial blood pressure, duration of this rise and heart rate, were compared with the effects produced by a control dose of epinephrine administered previously. Addition of catechol or pyrogallol caused a slight increase in the blood pressure response in some instances and in nearly

every case a marked increase in the duration. Several other compounds such as phenol, resorcinol, phloroglucinol etc were without effect. Since inactivation of epinephrine may proceed along several lines (BACQ, *J Pharmacol & Exper Therap* 95, part 2, 1, 1949) various compounds such as glycine, oxophenarsine hydrochloride, ascorbic acid, and nicotinamide were substituted for the hydroxy compounds. None of these compounds affected the epinephrine actions studied.

Glomerular filtration— Tm_g relationships in the dog JULES H. LAST, ISADORE PITESKY,* PAUL JORDAN, JR * AND EPPERSON BOND * *Dept of Pharmacology and Surgery, Univ of Illinois College of Medicine, Chicago, Ill*

In the course of routine Tm_g determinations on normal, unanesthetized dogs, it was observed that changes in Tm_g values seemed to be accompanied by similar changes in glomerular filtration rates (GFR). These observations are at variance with accepted concepts that Tm_g is independent of GFR. Computation of coefficients of correlation (r) based on 246 clearance periods performed on 7 dogs yielded a mean r of 0.561 which was highly significant ($P = < .01$). In 5 out of 7 animals the r values ranged from 0.569–0.879. In these experiments the dogs were not dehydrated by the infusion of 16–17% glucose at 6 cc/min. The data indicate that in the dog the Tm_g is not independent of GFR. To explain these observations in terms of the theory that all nephron units are simultaneously active in the dog kidney, one must postulate that any factor altering the physical process of glomerular filtration must in similar manner alter an enzymatic process of tubular resorption. A more plausible explanation is found in the theory of intermittency of nephron activity, where activation or inactivation of nephron units would directly influence both GFR and Tm_g . Alterations in mean filtration pressure would fail to explain the phenomenon as long as the glucose load exceeds the Tm_g .

Survey analyses of human milk and fat for DDT content EDWIN P. LAUG, CLAUDIA S. PRICKETT,* AND FRIEDA M. KUNZE * *Division of Pharmacology, Food and Drug Administration, Federal Security Agency, Washington, D. C.*

Twenty-four samples of human milk and 35 samples of human fat were analyzed for DDT. The milk samples were obtained from subjects, some of which occasionally used the common DDT-containing household sprays. There was no occupational exposure to DDT. Abdominal fat was obtained at autopsy or biopsy from subjects, some of which had occupational exposure, but the survey is too preliminary to report any exact correlation between exposure and DDT.

content of the fat at this time. Analyses for DDT were made by a modified Schechter-Haller procedure, sufficiently sensitive to detect and quantitate 5 μ gm DDT in 100 ml milk or 3 μ gm DDT/gm of fat. The DDT concentration in human milk ranged from 0 to 0.77 p p m, with 'high' values of 0.18, 0.28 and 0.77 and 'low' values of 0, 0.04, 0.04, 0.05, 0.06, 0.06, 0.06. The average for all samples was 0.14 p p m. The DDT concentration in human fat ranged from 0 to 34 p p m with high values of 10, 11, 15, 17 and 34. In 12 samples no DDT was found, or only in traces (0.5 p p m). The average for all samples was 5.1 p p m.

Systemic versus nonabsorbable sulfonamide in the treatment of acute bacillary dysentery
DAVID LEHR, JOHN T. LUETTERS,* ARNOLD J. CAPUTE,* HAROLD ABRAMSON,* AND LAWRENCE B. SLOBODY * *Depts. of Pharmacology and Pediatrics, New York Med. College, Flower and Fifth Avenue Hospitals, New York City*

The therapeutic effectiveness of sulfadiazine was compared with that of a triple mixture of sulfonamides (sulfadiazine, sulfamerazine and sulfacetimide in equal amounts) and that of the nonabsorbable sulfonamide—phthalylsulfacetimide, in an outbreak of bacillary dysentery (*Shigella sonnei*) among 330 children ranging in age from early infancy to 14 years. A total of 79 affected children received oral sulfonamide therapy in weekly courses. Of these 27 were treated with sulfadiazine (0.2 gm/kg daily plus double the amount of sodium bicarbonate), 24 children received the triple mixture in the same dosage but without alkali, and 28 received phthalylsulfacetimide in amounts increasing from a daily dosage of 1.5 gm for the ages of 2-6 years, to 2 gm for 6-10 years and 4 gm for those above this age group. Consecutive negative cultures from rectal swabs on the 4th to 7th day after discontinuation of the sulfonamides were considered indicative of cure. The triple mixture demonstrated the highest therapeutic efficacy. It effected the cure of 20 patients after one course of treatment, as compared to only 11 each in the sulfadiazine and phthalylsulfacetimide groups. This difference between the triple mixture and the other 2 sulfonamides is statistically significant (chi square method). The fact that the triple mixture produced substantially higher blood levels than sulfadiazine could not adequately explain the greater therapeutic efficacy of the former, since phthalylsulfacetimide proved as good as sulfadiazine without having entered the bloodstream to any significant extent. It would seem, therefore, that the triple mixture exerts a substantially higher antibacterial effect within the gastrointestinal tract. The curative efficacy of phthalylsulfacetimide

appears highly satisfactory since it compares favorably with sulfadiazine.

Effects on anaphylactic shock of salicylates, aminopyrine and other chemically and pharmacologically related compounds
MARK H. LEPPER,* BENJAMIN F. MILLER,* ESTON R. CALDWELL, Jr,* AND PAUL K. SMITH *Depts. of Medicine and Pharmacology, George Washington Univ. School of Medicine, Washington, D. C.*

The effects of salicylates on anaphylactic shock in rabbits were compared with that of certain compounds chemically and pharmacologically related to the salicylates. The compounds studied were acetanilid, neocinchophen, aminopyrine in the group with similar pharmacologic properties and para-aminobenzoic acid, sulfanilamide, and sodium gentisate in the chemically related group. All compounds were used in equivalent amounts, based on aspirin, 0.64 gm. In addition, for special control purposes, the following were employed: sodium bicarbonate, 0.32 gm; Nembutal, 30 mg; and codeine phosphate, 5 mg. Rabbits weighing approximately 2 kg were sensitized by repeated injections of egg white. After 2 weeks had been allowed for sensitivity to develop, the animals were divided into experimental and control groups. In the former animals, the drug was given suspended in water by pharyngeal tube, while the latter received an equal dose of water by tube one hour before a shocking dose of egg white was given. Aspirin, sodium salicylate, and aminopyrine were found to give significant protection against this type of shock (Aspirin: 8 deaths in 57 animals, controls: 39 deaths in 74 animals; Sodium salicylate: 9 deaths in 43 animals, controls: 32 deaths in 60 animals; Aminopyrine: 1 death in 22 animals, controls: 19 deaths in 34 animals). None of the other compounds was definitely effective, although some may have demonstrable effect in more animals or by different techniques. The activity of the salicylates and aminopyrine did not correlate with their other pharmacologic properties. They exhibited no antihistaminic action in rabbits.

Factors influencing toxicity of fortified red squill powder
E. WILLIAM LIGON, JR., AND ROBERT R. SPROWELL * *Pharmacology Laboratory, Insecticide Division, Livestock Branch, Production and Marketing Administration, U. S. Dept. of Agriculture, Beltsville, Md.*

A fortified red squill powder was bioassayed on 6 strains of male albino rats. After being fasted for 24 hours, rats weighing between 150 and 250 gm were offered bait consisting of 10% squill in bread crumbs. After 16 hours they were returned to normal diet for an 8-day observation period. Bioassays were similarly performed, by administering through a stomach tube squill suspended in

tragacanth These animals were returned immediately to normal diet

STRAIN	LD ₅₀ , MG VOL. FEEDING	SQUILL/KG RAT STOMACH TUBE
I	210 ± 27 0	165 ± 14 2
II	127 ± 11 0	125 ± 13 5
III	147 ± 9 2	125 ± 9 7
IV	154 ± 10 3	127 ± 16 2
V	148 ± 15 7	140 ± 10 6
VI	170 ± 15 0	175 ± 24 3

Bioassays were also performed with two variations in technique In one case, different concentrations of squill were used for voluntary feeding In the other, food was withheld for 16 hours after dosage by stomach tube The LD₅₀ for 10% bait was 125 ± 15.5 mg/kg, for 3%, 200 ± 29 mg/kg, and for 1%, 200 ± 20 mg/kg The LD₅₀ for controls fed immediately after stomach tube administration was 177 ± 19 mg/kg and for those denied food for an additional 16 hours was 108 ± 11 mg/kg

Bioassay method for diuretic substances J MAXWELL LITTLE AND CARLOS COOPER, JR * *Dept of Physiology and Pharmacology, Bowman Gray School of Medicine, Wake Forest College, Winston-Salem, N C*

Female dogs were prepared by episiotomy for easier catheterization The dogs were given 35 cc of distilled water per kg by stomach tube, and the food and water were removed Approximately 16 hours later the animals were catheterized, the bladder was emptied, and the urinary specific gravity was determined If the specific gravity was 1.030 or greater the animal was discarded The animals were given 25 cc of distilled water per kg by stomach tube and the diuretic substance was administered The animals were put in metabolism cages in a room maintained at 22°C At the end of 6 hours the animals were catheterized, and the total urine volume was measured Results were expressed as diuretic ratio $\left(\frac{6 \text{ hour urine volume}}{25 \text{ cc} \times \text{kg body weight}} \right)$ Ninety control experiments on 12 dogs gave a mean ratio of 1.04 ± 0.172 In arriving at this method several hydration procedures were tested removing food and water 16 hours before the experiment, omitting the first hydration procedure, and collecting for 5 hours at room temperature yielded a mean ratio of 0.20 ± 0.149 in 14 experiments, repeating this experiment with the exception of leaving water available until 1 hour before the experiment gave a mean ratio of 0.37 ± 0.274 in 12 experiments repeating this experiment with the exception of collecting for 6 hours at 22°C gave a mean ratio of 0.82 ± 0.299 in 111 experiments The mean ratios following the iv injection of 2-2.5 cc of 3 pooled dialyzed concentrated human urine samples are 1.98 ± 0.355 , 1.79 ± 0.396 and 1.59 ± 0.314

Effect of epinephrine on intestinal volume A E LIVINGSTON *Dept of Pharmacology, Temple Univ School of Medicine, Philadelphia, Pa*

When epinephrine is injected into a systemic vein of an anesthetized dog, an increase in volume of an intestinal loop in a plethysmograph takes place The portal vein pressure increases and the liver volume usually decreases These effects begin when the systemic blood pressure is near the maximum When the injections are made into a mesenteric vein a prompt and similar effect is produced on intestinal volume and portal pressure, though the effect on the systemic blood pressure may be very slight If the injection is made into a branch of the mesenteric artery leading to the loop of intestine, a marked decrease in volume of the loop takes place and an increase in portal pressure follows When the portal blood is shunted to an external jugular vein and injection is made into a femoral vein a similar increase in volume of intestinal loop and portal pressure takes place, and an increase in blood volume flows through the shunt during the increase in portal pressure When injections are made into a femoral vein and arterial pressure is held constant, or nearly constant, an increase in intestinal volume and portal pressure usually is produced though the magnitude of effect is not so great as when the blood pressure is allowed to rise An increase in intestinal volume and portal pressure is observed after the administration of atropine, section of both vagi, or the section of the splanchnic nerves

Sympathetic ganglionic stimulant drugs S LOEWE, L S GOODMAN AND SUSANNE L PUTTUCK * *Dept of Pharmacology, Univ of Utah College of Medicine, Salt Lake City, Utah*

Potent and selective ganglionic vasopressor agents were found in the new class of o-cresyl choline ethers ($R-CH_2-C_6H_4-O-C_2H_4-N(CH_3)_2-OH$) Greatest potency was found in those representatives of the class in which R is phenyl, p-fluorophenyl or 2-thienyl, these 3 substances are approximately equal in potency Like nicotine, these drugs are sympathetic and parasympathetic ganglionic depressants at high dosage levels, their depressant doses are similar to those of nicotine However, the new choline ethers differ from nicotine in the following respects 1) They lack the muscarinic and curare-like actions of nicotine, its central nervous actions and its activity on smooth muscle and carotid sinus chemoreceptors 2) The threshold dose for sympathetic ganglionic stimulation is smaller than that of nicotine 3) They gave no indications of parasympathetic ganglionic stimulation in a wide range of doses inducing stimulation of sympathetic effector functions The degree of selectivity of sympathetic as against parasympathetic stimulation is undergoing con-

tinued study —An interesting feature of the new choline ethers is that they also possess considerable antihistaminic activity, being approximately equal in potency to diphenhydramine

Mechanism of vasomotor actions of sparteine Go LU *Dept of Pharmacology and Therapeutics, Stanford Univ School of Medicine, San Francisco, Calif*

Sparteine sulfate (5-10 mg/kg) injected i v in anesthetized (chloralose, pentobarbital, or morphine-ether- α -tubocurarine) dogs and cats produced bradycardia and fall of blood pressure. After injecting 40 mg/kg within 30 minutes, an additional 5-10 mg/kg i v caused slight pressor effect (mostly under artificial respiration). The depressor phase was accompanied by increase in leg volume and decrease in kidney, spleen or intestine volume and was due to peripheral vasodilatation, since the cardiac output (Fick's principle) increased slightly or remained unchanged. Cardiometric record showed ventricular dilatation with increase in pulse volume. The peripheral vasodilatation was not significantly altered by section of vagi, atropinization, pyribenzaminization or carotid denervation. However, dilatation was prevented by pithing, denervating a leg, nicotine or ergotoxinization. Cisternal injection revealed no central vasomotor depression. Femoral artery injection revealed no effect or slight vasoconstriction. Sparteine prevented the pressor effects of carotic occlusion, or of sciatic stimulation, and hyperpneic responses of nicotine and acetylcholine (atropinized animals), and potentiated the pressor effect of epinephrine. It also interrupted the contraction of the nictitating membrane produced by electrical stimulation of the preganglionic fibers, whereas postganglionic stimulation remained unaffected. Thus, sparteine produces vasodilatation by depression of sympathetic ganglia. The later pressor effect accompanied by decreases in kidney, intestine and leg volumes is due to peripheral vasoconstriction resulting from direct smooth muscle stimulation.

Diethylaminoethyl esters of 2-hydroxy- and 2-alkoxy-4-aminobenzoic acid as local anesthetics

F P LUDUENA AND JAMES O HOPPE * *Sterling-Winthrop Research Inst, Rensselaer, N Y*

The local anesthetic activity of 2-hydroxy and various 2-alkoxy analogs of procaine, synthesized by Clinton and co-workers, was determined by various methods. A comparison of the duration/log concentration curves obtained by the sciatic nerve block method in guinea pigs disclosed an increase in activity with an increase in length of the alkoxy side chain from methoxy through the butoxy substituent. Procaine is less active than the 2-hydroxy and more active than the 2-methoxy

analog. The butoxy analog (WIN 3706) is about as active as tetracaine. By intraspinal injection in rabbits, both the propoxy analog (WIN 3459) and WIN 3706 produce anesthesia of rapid onset and relatively short duration. Spinal anesthesia was obtained with a concentration as low as 0.03% of WIN 3706 which is below the threshold concentration for tetracaine. In these rabbits, the signs of local injury were minimal, no paralysis was observed with WIN 3706 and, of the 30 rabbits injected with sublethal doses of WIN 3459, only one showed a residual hind leg paralysis. Topical anesthetic activity was determined by corneal irrigation in rabbits. Both WIN 3459 and WIN 3706 were more active than cocaine but less active than tetracaine. The toxicity, as determined by i v injection in mice, parallels the local anesthetic potency, as determined by the nerve block method. The LD_{50} of WIN 3459 is 9 ± 0.4 mg/kg, and that of WIN 3706, 4 ± 0.3 . When the local irritation produced by intradermal injection in rabbits was determined by the trypan blue method, WIN 3459 and WIN 3706 were found $\frac{1}{2}$ and $\frac{1}{3}$ as irritating as tetracaine, respectively.

Sodium catechol disulphonate protection in experimental uranium nitrate poisoning L M LUSKY* AND H A BRAUN * *Division of Pharmacology, Food and Drug Administration, Federal Security Agency, Washington, D C*

When an aqueous solution of disodium catechol disulphonate (DCD) is mixed with an aqueous solution of uranium nitrate, an amber colored complex is formed. Protection against the systemic effects of uranium nitrate in rabbits occurs when DCD is administered by intramuscular injections. For example, the LD_{50} of uranium nitrate administered s c is increased more than 4-fold if intramuscular treatment with DCD is started immediately after injection of the uranium salt. Protection is also obtained, though to a lesser extent, when treatment with DCD is delayed one hour after administration of uranium salt. Combined treatment with DCD and sodium citrate was more effective in protecting rabbits from systemic effects of uranium nitrate than treatment with either DCD or sodium citrate alone given under the same schedule.

Vasomotor and gastrointestinal studies using Diparcol C KEITH LYONS, AND BOYD H METCALF (introduced by KEITH S GRIMSON) *Dept of Surgery, Duke Univ School of Medicine, Durham, N C*

Diparcol, diethylamino, 2, ethyl-N, dibenzopara-thiazine hydrochloride, has been tested in dogs and man. In 4 dogs with vagi cut Diparcol was given using initial doses of 0.5 mg/kg and adding larger increments until during 3 or 4 hours total amount was 81.5 to 130 mg/kg. With the

final dose death occurred suddenly. Results achieved when 5 to 10 mg/kg had been given were not much altered by later larger amounts. Though increments of 5 to 20 mg/kg effected reduction of pressure lasting several minutes, pressure generally maintained at normal values to the lethal dose. Increase of blood pressure with carotid artery occlusion occurred throughout the experiment, as did rise of pressure with stimulation of the central end of one vagus. Marked slowing of pulse and drop of pressure with stimulation of the peripheral end of a vagus were partially blocked after 3.0 to 23 mg/kg total accumulative dose and completely blocked after 5, 10, and 31 mg/kg in 3 animals. In the 4th animal even to the lethal dose block remained partial. Pressor response with epinephrine, 1 to 5 μ gm/kg, was blocked by 5, 6.5, 20, and 44 mg/kg total additive dose of Diparcol. After large doses anoxia produced decrease of blood pressure in 2 dogs, no change in 1 and slight decrease followed by an increase just after the anoxia in the 4th. Five to 15 mg/kg i.v. effected temporary rise of blood pressure and pulse in 3 unanesthetized dogs. Gastric emptying and ileal transit time determined by roentgenologic methods in 9 dogs after 5 to 30 mg/kg were essentially normal. Observations in patients are similar.

Comparative effects of repeated doses of curarizing agents in man DAVID W. MACFARLANE* AND KLAUS R. UNNA. *Dept. of Pharmacology, Univ. of Illinois, College of Medicine, Chicago, Ill.*

In 4 normal male subjects, the effects of a first and a second dose of D-tubocurarine chloride (DTC), dimethyl ether of D-tubocurarine chloride (dimdTC), and decamethylene-bis(trimethyl-ammonium bromide) (C10) were compared. Criteria for degree of effect were depression of grip strength as measured by a dynamometer, recovery time measured as time in minutes for 75% recovery of grip strength (t_{75}), and depression of vital capacity. The interval between i.v. injections was chosen to be 45 minutes for DTC and dimdTC and 30 minutes for C10. It has been shown, previously, that at the time intervals chosen, effects of the first injection could no longer be objectively measured. It was found that after 45 minutes, only $\frac{1}{2}$ of the initial dose of DTC or dimdTC was required to produce effects similar to those of the original dose. This was unlike C10, which if reinjected in the full initial dosage after 30 minutes, failed to produce effects comparable to those of the first injection. In all subjects, the effect of the second dose of C10 on grip strength and vital capacity was significantly smaller. In an attempt to obtain data on animals under comparable conditions, head drop doses of DTC and C10 were determined on both cats and rabbits and redetermined at

suitable intervals. With both drugs and in each animal species, the second head drop dose was significantly smaller than the first. Thus, the tachyphylaxis to C10 observed in man was not seen in cats or rabbits.

Influence of penicillin-penicillinase combinations and PABA sulfonamide mixtures on the growth of higher plants compared with bacteria DAVID I. MACHT. *Dept. of Pharmacology, Sinai Hospital, Baltimore, Md.*

Inasmuch as many botanists regard bacteria as microscopic plants, experiments were made in regard to the action of sulfonamides and PABA separately and in combination with each other on the root growth of *Lupinus albus* seedlings. The drugs studied were 3 aminobenzoic acids and various sulfa compounds. Seedlings of *Lupinus albus* were grown in Shive's solution with and without the above drugs. It was found that the ortho-aminobenzoic acid was the most toxic for root growth, and para-aminobenzoic acid the least toxic. All the sulfa compounds exerted a biphasic effect, dilute solutions stimulating the root growth, while greater concentrations inhibited it. Combinations of PABA and sulfonamide always produced a synergistic effect. That is, instead of PABA inhibiting the action of sulfa drugs, it actually potentiated their toxicity. The action of penicillin and penicillinase was studied in 2 ways: the effect on the root growth of *Lupinus albus* seedlings and the effect on respiration of *Lupinus* seed emulsions. Penicillin, itself, is toxic for root growth, and the amorphous variety is more toxic than the crystalline. Penicillinase (Schenley) was employed, obtained from cultures of *B. cereus* strain NRRL-B569. This enzyme is very little toxic for *Lupinus* root growth. Combinations of penicillinase and penicillin produced a synergistic effect. The reductases of *Lupinus* seeds were studied by Thunberg's method. Penicillin retarded the reducing process. Penicillinase alone exerted little effect, a combination of the 2 acted synergistically.

Toxicity of penicillin for previously treated animals DAVID I. MACHT AND THOMAS HOFFMASTER*. *Dept. of Pharmacology, Sinai Hospital, Baltimore, Md.*

Because of the very low toxicity of penicillin, it was deemed desirable to test its effect on animals previously conditioned, either physiologically or pharmacologically. The animals employed were mice, rats, guinea pigs, rabbits and cats. Physiologically conditioned were hypophysectomized rats and rabbits unilaterally adrenalectomized. No difference in the toxicity of either crystalline or amorphous penicillin was found between these and normal animals. In pharmacological experiments large doses of various drugs chosen for

their selective action for different physiological functions were given to different animals and the effect of subsequent injections of penicillin in large doses was investigated. The following drugs were studied: digitalis, Cobra neurotoxin, mercuric chloride, alloxan, sulfonamides dicumarol, heparin, salicylates, antipyrin, dinitrophenol and pentothal. None of these increased the toxicity of penicillin on subsequent injections even in very large doses (100,000 to 500,000 units). A potentiation in toxicity was noticed in animals treated with phosphorus and with camphor. The mortality from these poisons was greater when penicillin was combined with them. Next to the invaluable chemotherapeutic properties of penicillin the authors find the most important pharmacological properties to be its thromboplastic effect. This is efficiently antagonized by dicumarol and heparin. The salicylates and sulfadiazine do not effectively prolong coagulation time except after their repeated administration for a long period of time.

Pharmacologic data on DL-2-amino-L-(p-methylphenyl)-propane EDWARD MACKO,* EDWIN J. FELLOWS AND A. JAMES FENDRICK * *Research Division, Smith, Kline and French Laboratories, Philadelphia, Pa.*

In the present studies the hyperkinesthetic activity of DL-2-amino-L-(p-methylphenyl)-propane (No. 42) in rats was found to be $\frac{1}{2}$ intraperitoneally and $\frac{1}{8}$ orally that of D-2-amino-L-phenylpropane (No. 2). Orally, No. 2 was more than 10 times as active as No. 42 in antagonizing the depressant effect of phenobarbital. The analeptic potency of No. 42 therefore does not parallel its effectiveness in producing an increase in motor activity. Subcutaneously in dogs, 5 mg/kg exhibited the same antiappetite potency as 1 mg/kg of No. 2. The foregoing data suggested that No. 42 may be a useful anorexigenic agent with a low order of antisleep effect. No. 42 also possesses an analgetic action as indicated by the fact that doses of 5.0 to 20.0 mg/kg intraperitoneally markedly elevated pain thresholds in cats. In subacute and chronic toxicity studies no evidence of changes due to administration of No. 42 was observed by histological examination of tissues removed from rats, rabbits, guinea-pigs and dogs which received massive daily doses (up to 30 mg/kg) of this compound for periods of one to 3 months. The data obtained in the present experiments indicate that No. 42 should be evaluated clinically as an antiappetite and as an analgetic agent.

Bioassay method for derivatives of Veratrum Viride GEORGE L. MAISON AND J. W. STUTZMAN *Dept. of Pharmacology, Boston Univ. School of Medicine, Boston, Mass.*

Hypotensive action in dogs under pentobarbital anesthesia has been utilized as bioassay method for Veratrum Viride derivatives. Great quantitative variability of response (not tachyphylaxis) on repeated administration to the same dog as well as to different dogs resulted. Most satisfactory route of administration proved to be i.v. infusion at constant rate (in $\mu\text{g/kg/min}$) for 10 minutes. Variability was reduced by bracketing the infusion of unknown between two infusions of a standard reference powder. The fall of mean femoral pressure at its nadir expressed as per cent of pre-existing pressure was used as the criterion of response. Statistical analysis showed that units of 6 dogs were required for a detection level (± 2 standard deviations) of 20% difference in potency. Units of 9 or 12 dogs did not improve the detection level. The reference standard utilized was Veriloid (J. W. Dart Labs). In 232 trials the mean response to standard infusion was $29.9 \pm 12\%$ fall of mean arterial pressure. The following substances had less than 10% of the potency of the reference standard (mg for mg): jervine, rubijervine, isorubijervine, n-methyl jervine*, o-acetyl n-methyl jervine*. * Not derived from Veratrum viride.

Studies on renal function during various stages of anesthesia produced by thiopental in dogs ARNOLD H. MALONEY, WALTER M. BOOKER, JAMES R. TUREMAN* AND CLAUDIA M. RATLIFF* *Dept. of Pharmacology, Howard Univ. Med. School, Washington, D. C.*

In connection with studies on the course of pentothal anesthesia as related to nutritional states, it was deemed important to make some evaluation of the effects of various states of anesthesia on kidney function in dogs. Accordingly, the following experiments have been designed to study glomerular filtration rate and renal plasma flow as related to the plasma pentothal levels. The periods of anesthesia were divided into light, moderate, and deep as determined by the Draper-Whithead reflex response. During these periods, the glomerular filtration rate is determined by the creatinine clearance method and the effective renal plasma flow by the diodrast plasma clearance. Also, during these periods, the plasma level of pentothal is determined. Preliminary experiments at this time show that the highest values for the glomerular filtration rate are obtained in the periods of light anesthesia and the lowest values during the periods of deepest anesthesia. The results of the effective renal plasma at the time are not definitive. The plasma levels of pentothal may be correlated with degree of anesthesia. Experiments are now under way to extend these observations.

In vitro antihistamine and anti-acetylcholine activity of several antihistamines S MARGOLIN, A MAKOVSKY AND R TISLOW (introduced by H B HAAG) *Biological Research Laboratories, Schering Corporation, Bloomfield, N J*

Isolated portions of guinea pig ileum suspended in Tyrode solution were used to determine the *in vitro* activity of several antihistamines. The end-point in these tests was inhibition of the spasmogenic effect of histamine dihydrochloride (1 5, 000,000) or acetylcholine chloride (1 50,000,000) following a 3-minute exposure of the tissue to the antihistamine. Dilutions which would inhibit the spasmogenic contraction by 50% and confidence limits were calculated from responses to graded concentrations of the drugs. While the data are of interest in differentiating between antihistamine and anti-acetylcholine activity under the conditions of an *in vitro* test, they do not give an index of antihistamine efficacy when compared with tests *in vivo* and with clinical experience.

Effect of localization of pentothal in fat on its duration of action LESTER C MARK,* ELEANORE BERNSTEIN* AND BERNARD B BRODIE *Depts of Anesthesiology and Biochemistry, New York Univ College of Medicine and New York Univ Research Service, Goldwater Memorial Hospital, New York City*

Previously reported studies indicated that pentothal is slowly metabolized *in vivo* and that the rapid decline in plasma levels and quick recovery following a single *i v* dose of the drug are due to its localization in body fat. The interrelationship of plasma, tissue and fat concentrations has been further studied in dogs. After the *i v* administration of pentothal, concentrations in liver and plasma were high at first but decreased rapidly, while those in fat were negligible at first but increased steadily, and finally accounted for most of the drug in the body. Concentrations in the central nervous system appeared to decline with those of liver and plasma as evidenced by cerebrospinal fluid levels. Different fat depots varied in the rate of pentothal uptake but within 24 hours the pentothal concentrations of all fat depots were similar. The clinical effects of a given dose of pentothal appear therefore to depend upon the plasma level at which equilibrium is established between fat and the rest of the body. After a small dose, this level is subhypnotic and the drug is ultrashort acting. After a large dose, the equilibrium level is above the hypnotic level and is maintained there for considerable periods by the pentothal reservoir in fat. Preliminary investigation with the oxygen analogue, pentobarbital, indicated that its localization in fat was less extensive.

Synthetic curare compounds VI Isomers of N-methyl-tetrandine iodide DAVID F MARSH AND D A HERRING * *Dept of Pharmacology, West Virginia Univ School of Medicine, Morgantown, W Va*

Of the 8 possible isomers of the tetrandine type biscochlorine alkaloids, 5 have been isolated and characterized. We have converted these to the quaternary ammonium derivatives and compared their activity with *D*-tubocurarine chloride. As well as apparently unrelated side-effects, *D*-tubocurarine and, *O,N*-methyl-repandine have some histaminic activity, and all the agents in high dose in cats, except the *N*-methyl-tetrandine, produce non-specific falls in blood pressure. An attempt has been made to correlate these observations with the probable structural models of the compounds.

Studies with low vapor concentrations of carbon tetrachloride labeled with carbon 14 I Absorption, distribution and elimination upon inhalation by monkeys D D MCCOLLISTER, W H BEAMER, G J ATCHISON AND H C SPENCER (introduced by D D IRISH) *Biochemical Research Laboratory and Spectroscopy Laboratory, Dow Chemical Company, Midland, Mich*

Monkeys inhaled radioactive carbon tetrachloride through a mask and respiratory valve system at a 'contact' concentration of 46 p p m (0.289 mg/l) for periods of 139 to 344 minutes. Absorption occurred at an average rate of 1.34 mg/kg/hour, or 30% of the total weight of carbon tetrachloride inhaled, the blood concentration of carbon-14 did not reach saturation within the time of the experiments. Tissue analyses for radioactive carbon gave distribution ratios (blood = 1) for depot fat = 7.86, liver = 3.00 and bone marrow = 2.97. Bone, lung, muscle, spleen, heart, kidney and brain had distribution ratios ranging from 0.14 to 0.96. Carbon tetrachloride was metabolized by the monkeys. Ten to 20% of the total radioactivity in the blood and expired air was present in the form of $C^{14}O_2$. Carbon-14 was also identified in urinary urea and carbonate but the chief metabolic product in urine was an unidentified non-volatile material found to have attributes suggestive of a conjugate. Twenty percent of the absorbed carbon tetrachloride was eliminated by exhalation in the form of $C^{14}O_2$ and volatile 'carbon tetrachloride' during the first 18 hours following the end of an exposure. Carbon-14 was measurable in samples of expired air over a 4-week period. It was estimated that a total of 50% or more of the carbon tetrachloride absorbed by the monkey was eliminated in this manner. The remainder appeared to be excreted in the feces and urine.

Electrical and chemical activities of fibrillating denervated and innervated muscle deprived of Ca^{++} A R MCINTYRE, A L DUNN,* AND FENWORTH DOWNING * *Dept of Physiology and Pharmacology, Univ of Nebraska College of Medicine, Omaha, Nebr*

Intravenous perfusion *in vivo* of fibrillating denervated dogs' muscles with the following solutions (at pH 7.0, 37°C) was without immediate effect on the electrical activity of the fibrillating muscles, Tyrode solution, Tyrode solution containing eserine 1:100,000, Ca^{++} free Tyrode solution and Ca^{++} free Tyrode solution containing 1 mM of procaine hydrochloride. In contrast the electrical activity of innervated muscle aroused by perfusion with Ca^{++} free Tyrode solution was promptly interrupted when procaine was added to the Ca^{++} free solution. Muscle electrical activity was recorded throughout the experiment. The perfusing solutions were collected and rendered protein free by trichloroacetic acid precipitation. The protein free filtrates were each divided into 2 fractions. One of each pair was heated at pH 9, cooled and neutralized with CO_2 . All the filtrates were then tested for ACh on the isolated heart of *Venus mercenaria*. All filtrates obtained from perfusates collected from both innervated and denervated muscles while electrically active contained a heat labile cardio-inhibitor (ACh) in concentration of approximately 1.5 to 3.2 μgm of ACh per ml. No ACh was detected in any perfusate collected from muscles at rest. Examination of single spike potentials from innervated and denervated muscles revealed no consistent differences. Very rapid spikes (0.5 msec) were obtained from both. The increased sensitivity to ACh in the denervated and innervated muscle, deprived of calcium, is of the same order (circa 1,000-fold). These findings are discussed and indicate that the activity of cholinesterase at the junction is decreased by denervation and, in innervated muscle, by loss of normal resting polarity at the nerve endings.

Effect of colchicine on certain synthetic reactions *in vitro* GORDON R. MCKINNEY (introduced by FREDERICK BERNHEIM) *Dept of Physiology and Pharmacology, Duke Univ School of Medicine, Durham, N C*

Rat liver slices or homogenates were incubated with appropriate substrates in 20-ml beakers in a Dubnoff Metabolic Shaking Incubator at 38°C. The tissue was suspended in Krebs-Ringer's bicarbonate buffer, saturated with 95% O_2 -5% CO_2 mixture, which was also the gas phase. 1×10^{-3} M colchicine inhibited the formation of creatine from guanidoacetic acid and L-methionine by 65%. It was as effective as methyl-bis-(beta-chloroethyl)-amine HCl (MBA), and more effective than ure-

thane. Colchicine and MBA blocked the methylation of nicotinamide by methionine to a greater degree than did urethane. Colchicine, however, inhibited the formation of p-aminohippuric acid (PAH) only by 15%, whereas MBA inhibited by 70%. Urethane did not affect PAH synthesis. Neither colchicine nor urethane affected the conjugation of morphine which was inhibited by 85% by MBA. □

Plasma levels and urinary excretion of cocaine in dog and rabbit F G McMAHON,* L A WOODS AND M H SEEVERS *Dept of Pharmacology, Univ of Michigan, Ann Arbor, Mich*

Using an original and specific colorimetric method, the details of which will be published elsewhere, capable of estimating cocaine in concentrations above 0.4 $\mu\text{gm}/\text{cc}$ of plasma and 1.0 $\mu\text{gm}/\text{cc}$ of urine, a study of the plasma levels and urinary excretion of cocaine has been completed in the dog and rabbit. Intravenous administration of 5 mg/kg (base equivalent) of cocaine hydrochloride to the dog is followed by disappearance of the drug from venous plasma in about 30 minutes. Subcutaneous injection of 10 mg/kg and 15 mg/kg (base equivalent) of cocaine hydrochloride to the dog results in slowly increasing plasma levels of cocaine to a maximum of 1.1 to 1.8 $\mu\text{gm}/\text{cc}$, 1½ to 3 hours after the dose. Seven to 10% of the cocaine can be recovered from the urine of dog after s.c. and i.v. administration. The plasma concentration of cocaine in the rabbit, 60 to 90 minutes after s.c. administration of 30 mg/kg, is about 1.5 $\mu\text{gm}/\text{cc}$. Most workers have been unable to recover cocaine in rabbit urine. We can find none in cage-collected urine but cocaine is detectable in small amounts (less than one per cent of dose) if catheter-collected samples are analyzed.

Silicone fluids as vehicles for the intramuscular administration of drugs BERNARD P MCNAMARA, ELIZABETH A MCKAY* AND MAGGIE M QUILLE * *Pharmacology Section, Medical Division, Army Chemical Center, Md*

Silicone fluids offer possibilities as non-aqueous vehicles for intramuscular administration of drugs. Certain drugs injected intramuscularly in such fluids exert systemic effects within one minute. Animals injected (0.1 cc/kg) in a single area, 3 times per week for a period of 2 months showed no clinical signs of pain or muscle injury. The R.B.C., W.B.C., hemoglobin, hematocrit and body weight of these animals were not adversely influenced. The intravenous administration of such fluids in rabbits sometimes results in death, possibly because of 'fluid embolism'.

Sensitivity to digitals at the altitude of Bogotá K MEZEY AND R BAQUERO (introduced by

McKEEN CATTELL) *Cesar Uribe-Piedrahita Research Labs, Bogotá, Colombia*

In a previous report (*Am J Pharm* 115 326, 1943) it was shown that the cat unit of the same digitalis preparation under identical experimental conditions (weight, sex of animals, anesthesia, rate of infusion) was 17.6% less in Bogotá (altitude 2640 meters, temp 14.5°C) than in Girardot (altitude 326 meters, temp 29°C). In order to find out whether this difference is due to the diminished partial pressure of oxygen in Bogotá (110 mm Hg) or to the lower environmental temperature, experiments were carried out in the following manner. In the first series of 20 cats the cat unit of Digitaline Nativelle in a 1:100,000 solution was determined. The second series of 10 experiments was made in the same manner as the first except that the right nostril of each cat was connected with an oxygen bottle supplying 0.6 liter of oxygen per minute, started 15 minutes before beginning the infusion. The third series of 10 experiments was performed as the second except that a room-temperature of 29°C was maintained. Healthy cats of both sexes were used weighing from 1.7 to 3.6 kg and fasted 24 hours. Thiopental, 30 mg/kg intraperitoneally, was used for anesthesia. We used the technique of continuous injection or infusion since we did not find any advantage in the modification described in the USP XII. The following average lethal dose values were obtained: Control, 0.335 ± 0.001 mg, Oxygen, 14.6°C, 0.365 ± 0.0012 , Oxygen, 29.0°C, 0.378 ± 0.0009 . We conclude that the average lethal dose of a given digitalis preparation is lower in the natural environmental conditions of Bogotá than in an artificially oxygenated atmosphere and that the higher toxicity of digitalis in Bogotá is due mainly to the partial lack of oxygen and only to a slight extent to the lower environmental temperature.

In vivo conjugation by rats of parenterally administered histamine R. CARL MILLICAN (introduced by SANFORD M. ROSENTHAL *National Insts of Health, Bethesda, Md*)

It has been shown that an acetone powder extract of liver, in the presence of Coenzyme A, can conjugate histamine (*J Pharmacol & Exper Therap* 97 4, 1949). Conjugation *in vivo* was investigated by subcutaneous administration of histamine to normal and enterectomized rats. A colorimetric method was employed for the determination of free and conjugated histamine in the urine. The determination of conjugated histamine was confirmed by the addition of histaminase. In normal rats total urinary excretion of free and conjugate during the 48 hours following administration ranged from 21 to 43% of administered histamine. Twenty to 40% of the administered histamine was excreted as free histamine within

17 hours. Conjugated histamine was demonstrated in the urines of normal rats 17 to 24 hours following subcutaneous administration of 500 mg histamine base per kilo, in amounts ranging from 14-51% of total present. Following 100 to 200 mg of histamine base per kilo subcutaneously to enterectomized rats, the percentage conjugate excreted 17-40 hours following administration varied from 24-55% of the total present. Employing a modified metaphosphoric acid-cotton acid succinate method for demonstrating conjugated histamine, the viscera of several species of animals were analyzed for the conjugate. No significant amounts were demonstrable except following oral or parenteral administration.

Incidence of local reactions to mercurhydrin and thiomerin by subcutaneous injection in patients with congestive failure WALTER MODELL, HARRY GOLD, NATHANIEL KWIT,* LEON WARSHAW,* HAROLD OTTO,* AND WILLIAM ZAHM* *Dept of Pharmacology, Cornell Univ Med College, Cardiovascular Research Unit, Beth Israel Hospital, and the Cardiac Service of the Hospital for Joint Diseases, New York City*

In a recent paper from our clinics, attention was called to the fact that the control of congestive failure most effectively, requires self-injection of the diuretic as in the case of insulin for diabetes. An effective mercurial diuretic tolerated by the subcutaneous route would therefore constitute an important advance. Several recent reports declared that thiomerin by the subcutaneous route was substantially free of local reactions, and during this period one report stated that mercurhydrin, which is commonly used by intramuscular injection, is also relatively free of local reactions when given subcutaneously. The present study was carried out to secure more evidence concerning the local reactions to the two materials by subcutaneous injection. Severe pain, inflammatory induration, ecchymosis, slough, and fibrous nodules. In the case of thiomerin, 601 injections of 0.25 to 2 cc in 187 patients, yielded one or more of the above reactions in 28% of patients (26% of injections in those with only 1 injection). In 43 patients with about 10 injections each, reactions increased to 44% of patients (27% of injections). In the case of mercurhydrin, 1132 injections of 1 to 2 cc in 200 patients (average of 6 per patient), yielded one or more reactions in 27% of patients (9% of injections). The relative merits of thiomerin and mercurhydrin by subcutaneous injection will be discussed.

Antagonism between acetylcholine and tetraethylammonium in normal and denervated ganglia G. K. MOE AND H. KONZETT* *Sandoz Labs, Basel, Switzerland*

Addition of tetraethylammonium chloride (TEA) in a concentration of 1 100,000 to the fluid perfusing the normal superior cervical ganglion of the cat causes significant reduction of the response of the mediating membrane to previously maximal doses of acetylcholine injected into the ganglion. TEA in a concentration of 1 20,000 may completely block the response to control doses of acetylcholine, though larger doses of the mediator will again excite the ganglion. The ganglion sensitized to acetylcholine by previous section of the preganglionic fibers is much more resistant to the blocking agent TEA in a concentration of 1 100,000 causes no measurable depression of the response to acetylcholine, and in a concentration of 1 20,000 causes only moderate inhibition. It might be argued that a procedure which potentiates acetylcholine would correspondingly reduce the effectiveness of an acetylcholine antagonist, but if sensitization following denervation is due solely to reduction of the cholinesterase concentration in the ganglion, then the effective doses of acetylcholine reaching the ganglion cells must be the same in both normal and denervated structures. Reduction of the effectiveness of TEA by denervation implies a more profound change in the characteristics of the denervated ganglion cells.

Comparison of certain ganglionic blocking agents with tetraethylammonium bromide JAMES L MORRISON, CORNEILLE HEYMANS,* HARRY A WALKER AND ARTHUR P RICHARDSON *Dept of Pharmacology, Emory Univ School of Medicine, Emory University, Ga*

Dosage-effect-time relationships of tetraethylammonium bromide (TEA), bis-(α, α' -trimethyl ammonium propyl ether) dichloride-hydrate (MC-2444), 10-(2-diethylaminoethyl)-phenothiazine (Diparcol), and diethylaminoethyl ester of phenyl-cyclopentane-carboxylic acid (Parpanit) have been quantitated using depression of the carotid sinus pressor reflex and the nicotinic action of acetylcholine as the test responses. Dogs were anesthetized with chloralose and morphine, vagotomized and atropinized. Drugs, in progressively increasing doses, were given intravenously and tests made for blockade of the carotid sinus reflex and pressor response to acetylcholine 5 minutes after each injection of the test drug. This procedure was repeated until one or both of the responses were apparently blocked. Tests were made at frequent intervals for a period of two hours after the last dose of the drug. Using averages of the per cent change in blood pressure of 5 or 6 dogs, the results were plotted on graph paper and the ED_{50} 's were approximated and compared to TEA. In terms of dosage required to block the carotid sinus pressor effect Parpanit was $\frac{1}{4}$, Di-

parcol $\frac{1}{3}$, and MC-2444 5 times as active as TEA. In terms of dosage required to block the nicotinic action of acetylcholine Parpanit was 2 times, Diparcol 3 times, and MC-2444 10 times as active as TEA.

Studies on alterations of renal function following sciatic nerve stimulation and metabolic stimulants JOHN H MOYER* AND CARROLL A HANDLEY *Depts of Medicine and Pharmacology, Baylor Univ College of Medicine, Houston, Texas*

An attempt has been made to further evaluate the concept of functional renal bypasses as reported by Trueta *et al*. Changes in renal blood flow (measured with a bubble flow meter), systemic blood pressure, and renal arteriovenous oxygen differences following sciatic nerve stimulation were determined. After 2 hours the mean renal blood flow in the stimulated animals decreased 40% as compared to 6% in the control animals. This was accompanied by an increase of mean renal A-VO₂ of over 100% in the former as compared to 4% in the latter. The increase in A-VO₂ was consistently due to a fall in oxygen content of the blood coming from the kidney. Arterialization was never observed. Renal O₂ uptake remained more or less constant. Decreasing renal blood flow occurred irrespective of blood pressure changes although the latter increased in about $\frac{1}{4}$ of the animals receiving sciatic stimulation. Concurrently with these studies, we have observed by clearance methods that urinary output, glomerular filtration and glucose Tm increase in direct proportion to the renal plasma flow as a result of thyroxin or dinitrophenol administration. At the same time, the filtration fraction remained constant. Following these observations an experiment was set up during which renal blood flow was altered by sciatic nerve stimulation, adrenalin, and dinitrophenol administration. Direct measurement of renal blood flow and A-VO₂ differences were made concurrently with clearance studies.

On the biological antagonism between aspartic and glutamic acids controlling the acid produced by *Streptococcus fecalis*-R MICHAEL G MULINOS, A MARINARO* AND NELDA I RICCI* *Interchemical Corporation and Dept of Pharmacology, New York Med College, New York City*

Competitive inhibition among the various amino acids is known but its importance is microbiological and as a possible therapeutic approach has not been fully appreciated. Using the L-forms of aspartic and glutamic acids, the acid producing powers of *S. fecalis*-R were investigated at 37°C for from 24-120 hours. Biotin has been shown to substitute for aspartic acid but glutamic acid is essential for the growth of *S. fecalis*. Concentrations of L-glutamic acid below 0.15 mg per tube

as in the microbiological assay for this acid do not support growth in the presence of the usual amount of 20 mg of aspartic acid. Growth occurred when L-glutamic acid was raised or L-aspartic acid was lowered to 0.5 mg with optimal growth at an aspartic-glutamic ratio of 1:6. The data show that excessive concentrations of either L-glutamic or L-aspartic acid in relation to each other become inhibitory to acid production by *S. fecalis*. This fact may explain the difficulties encountered in the use of *S. fecalis* in the microbiassay of glutamic acid. The data present another example of a biological inhibition between two metabolically important compounds.

Liberation of histamine from carnosine and histidine JOE NASH* AND G. A. EMERSON *Univ of Texas Medical Branch, Galveston*

Treatment of carnosine and histidine solutions *in vitro* in various ways designed to resemble *in vivo* conditions of histamine release resulted in essentially negative findings. Tests for histamine were made with the Code modification of the Barsoum Gaddum technique. Solutions were treated with normal and sensitized tissue homogenates both in the presence and absence of antigen, with toxoid and toxoid plus tissue, and with UV light. These results are discussed in relation to evidence that carnosine acts upon histamine receptors, and in regard to the weak antihistamine activity of carnosine and histidine.

Actions of certain sympathomimetic amines on the excised, perfused guinea pig lung ENID A. NEIDLE,* CHARLES M. GRUBER AND JOAN E. COPELAND* *Dept of Pharmacology, Jefferson Med College, Philadelphia, Pa*

Sixty-six guinea pig lungs were perfused with Tainter's solution according to the method of Sollmann and von Oettingen and the responses of the bronchial musculature to various sympathomimetic drugs were recorded. One hundred and sixty-five injections of epinephrine in dilutions of 1:10,000 and 1:1,000 caused significant dilation of the bronchioles in every case and this response was taken as indicative of an active lung preparation. Of 108 injections of 1:1,000 ephedrine, 4 caused dilation of the bronchioles, 13 produced no change, and 91 caused marked constriction or spasm of the bronchial musculature. The constriction evoked by ephedrine was effectively antagonized by epinephrine and occasionally by epinine, kephrine, cobefrine, octin and isuprel. Amphetamine and tyramine, in 33 and 23 experiments respectively, caused marked constriction or bronchospasm which could be antagonized by epinephrine. Isuprel in a dilution of 1:10,000 was without effect. In 26 experiments 1:1,000 isuprel caused bronchodilation in 6, no significant change in 17, and marked bronchoconstriction in 3 cases.

Furthermore, in many experiments, epinephrine administered to an isuprel-treated lung either had no effect or caused slight constriction. It is possible that isuprel has a general toxic effect, rendering the lung unreactive to epinephrine and other active compounds. Neosynephrine, parendrine, tuamine, and desoxyephedrine evoked constriction in the isolated lung, while kephrine, cobefrine, and epinine and sympatol caused dilation or were ineffective. Octin and aranthol caused initial dilation followed by marked bronchospasm. Further experiments with these drugs will be performed on the histamine-treated guinea pig and the intact dog.

Studies on the surface chemistry of bone I. Recrystallization W. F. NEUMAN AND B. J. MULRYAN* *Dept of Radiation Biology, School of Medicine and Dentistry, Univ of Rochester, Rochester, N. Y.*

The problem of the skeletal deposition of toxic metals has received considerable attention. One common observation has been the localization of the foreign mineral in areas of active calcification. This phenomenon has led to an association of the calcification process with the mechanism of deposition of unphysiological minerals in the skeleton. Since the phenomenon of bone growth is very poorly understood, the situation did not lend itself to further exploitation. With the finding that uranium, radiophosphate, and fluoride are all taken up by bone by a physico-chemical process unrelated to cellular activity, a new emphasis has been placed on the surface chemistry of bone. It was hoped that the concentration of these minerals in the regions of active calcification could be explained in part by the greater surface activity of bone taken from these areas. The experiments performed did not critically test this hypothesis. Rather, they demonstrated that fresh bone undergoes recrystallization at a surprising rate. Nonetheless, a means of testing bone preparations for surface activity, even in the presence of active recrystallization, was devised. The problem may now be reinvestigated.

A comparative study of pharmacological properties of procaine and procaine amide PEGGY JO NEWMAN* AND BYRON B. CLARK *Dept of Pharmacology, Tufts College Med School, Boston, Mass.*

While procaine has been used for years as a local anesthetic, only recently have some of its other pharmacological properties been utilized. Some of these properties are shared by procaine amide which is metabolized differently than procaine. There are no extensive studies available on the pharmacological properties of either, and comparative studies are also lacking. Some re-

sults of such an undertaking are hereby presented

- 1) Duration of local anesthesia is the same for both at 0.5% without epinephrine, twice as long for procaine as for procaine amide with epinephrine. At 2% procaine amide anesthesia lasts twice as long as procaine.
- 2) Neither is effective on rabbit cornea at 2%. At 10% both produce anesthesia for 20 minutes.
- 3) Procaine (2%) produces a nerve block (dog sciatic), procaine amide does not.
- 4) Nerve action potential is abolished by procaine twice as rapidly as by procaine amide.
- 5) Acetylcholine induced motility in isolated rabbit ileum is antagonized by both. Procaine is about 1/13,000, and procaine amide 1/140,000 as effective as atropine.
- 6) In prolongation of refractory period of isolated rabbit auricle, procaine is nearly as potent as quinidine, procaine amide is only 25% as potent.
- 7) Both block superior cervical ganglionic transmission and nicotinic pressor response.
- 8) Systemically, procaine is a more potent respiratory depressant than procaine amide. Both produce hypotension in large doses (40 mg/kg), and procaine may raise blood pressure slightly in lower doses. Both cause bradycardia, T wave and QRS depression. Both are vasodilators, procaine being about five times more potent than procaine amide.

Blockade of epinephrine-induced cardioacceleration in the frog MARK NICKERSON AND GEORGE M. NOMAGUCHI * *Dept. of Pharmacology, Univ. of Utah College of Medicine, Salt Lake City*

Although many investigators have confirmed the inability of adrenergic blocking agents to prevent stimulation of the mammalian myocardium by epinephrine, reported results employing the frog heart have been highly variable. Study of the conditions required for blockade of stimulation of the isolated frog heart by epinephrine has revealed the following:

- 1) The inotropic response is not blocked under any of the conditions employed.
- 2) The chronotropic response of the winter-frog heart is effectively blocked by β -haloalkylamines and ergot alkaloids.
- 3) The chronotropic response of the summer-frog heart is unaltered by the β -haloalkylamines, and the ergot alkaloids have much less effect than on the winter-frog heart.
- 4) Anterior-pituitary extract injected into the intact animal decreases the sensitivity of the winter-frog heart to blockade so that it is comparable to the summer-frog heart.
- 5) Although not effective alone, fluoroacetate or iodoacetate combined with a β -haloalkylamine produce a blockade of the summer-frog heart comparable to that produced by the β -haloalkylamine alone in the winter-frog heart. Many other inhibitors were tested and all were ineffective alone or combined with β -haloalkylamines.
- 6) Glycerolmonoacetate antagonized the blockade produced by

β -haloalkylamines, alone or combined with fluoroacetate, in a non-competitive manner. Glycerol and sodium acetate are ineffective. It is concluded that epinephrine releases energy for the production of tachycardia in the winter-frog heart by only one mechanism, while at least two mechanisms are involved in the summer-frog heart. The difference is under anterior pituitary control. Both mechanisms involve the production of utilizable acetate and are independent of the energy sources for the inotropic response.

Studies on the interaction of ureas and barbiturates in potentiation of hypnosis STATA NORTON* AND EDWIN J. DE BEER *The Wellcome Research Laboratories, Tuckahoe, N. Y.*

Sub-hypnotic doses of unsymmetrical alkyl aryl ureas were found to potentiate barbiturate hypnosis in the mouse. Some of the urea derivatives possessed little or no hypnotic action in themselves. The degree of potentiation was also related to the size of the dose. Evidence was obtained which indicated that the potentiation could not be regarded as a simple summation of the hypnotic action of each of the two compounds injected. For some ureas there was an inverse relationship between the potentiation of hypnosis and the rate of respiration.

Electrical mechanism of brain waves HYMAN OLSEN (introduced by F. M. BERGER) *Training Division, Navy Dept., Washington, D. C.*

The current trend in brain wave research is to consider brain waves the result of large masses of neurons oscillating electrically and falling into step or synchronism with each other, thereby creating a large oscillatory-current area in the cortex. A theory is proposed for this oscillatory action of individual neurons and for their falling into step with one another. The theory is based on considering the neuron equivalent to a multi-vibrator circuit which is widely known in the electronic field. Such a circuit will shift readily from one of several types of electrical operation to another with slight changes of its battery voltages or circuit parameters (resistance, capacitance, etc.). It is suggested that, correspondingly, the neuron could shift from one to another of the several types of electrical operation necessary to produce brain waves with slight changes of its metabolic conditions.

Subacute toxicity of 'Thiomerin' compared to other mercurial diuretics O. S. ORTH, F. L. KOZELKA AND R. T. CAPPS * *Dept. of Pharmacology and Toxicology, Univ. of Wisconsin Med. School, Madison*

Clinical reports that N(gamma-carboxymethyl-mercaptomercuri-beta-methoxy)-propyl camphoric acid (Thiomerin) is but 1/100 as toxic as

Mercuhydrin are based on the well established acute cardiac ratio for these compounds when tested on anesthetized cats. Other tests such as intravenous toxicity in mice and actual demonstration of renal impairment, as determined by creatinine clearance in dogs, have indicated a relatively higher toxicity for Thiomerin than other common mercurial diuretics. In attempting to determine the effect of thioglycollic acid on toxicity of mercurial diuretics it was found that rather than a reduction there actually was an increase in toxicity when it was combined with Mercurophylline. This fact initiated a determination of the subacute toxicity of Mercurhydrin, Mercurophylline, Mercurophylline plus Sodium Thioglycollate, and Thiomerin, each administered subcutaneously or intravenously as a single injection. Deaths caused during or within the first 50 minutes after intravenous administration were definitely greater with Mercurophylline. In the table below is given the MLD₅₀ of a subacute type (deaths between 1 and 7 days) as determined in Sprague-Dawley rats, 200 of which were injected subcutaneously with various dosages of the mercurial expressed as total mercury, and 203 tested with mg/kg dosages given intravenously.

	SUBCUTANEOUS TOTAL MG OF HG	INTRAVENOUS HG IN MG/KG
Mercuhydrin	4 0	8 0
Mercurophylline	6 0	24 0 to 32 0
Mercurophylline + Na Thioglycollate	3 0	6 0
Thiomerin	1 0	6 0

While the combination of thioglycollic acid in organic mercurial diuretic compounds reduces the acute cardiac toxicity, it apparently *markedly increases* the subacute to chronic toxicity of such compounds whether given subcutaneously or intravenously.

Effects of ouabain on the coronary circulation and cardiac energetics

ROBERT G PAGE, HERBERT WENDEL, WARNER B SHELDON, AND ELWOOD L FOLTZ (introduced by CARL F SCHMIDT)
Laboratory of Pharmacology, Univ of Pennsylvania, Philadelphia

The effect of ouabain on cardiac energetics was studied in the intact normal dog under morphine, nembutal-dial-urethane anesthesia. The following determinations were made: coronary circulation (by the N₂O-catheterization technique), cardiac O₂ consumption (coronary circulation times arterio-coronary sinus oxygen difference), cardiac output (direct Fick-oxygen method), cardiac work in KgM (cardiac output times mean arterial blood pressure $\times 13.5 \times 10^{-6}$), rate (by electrocardiogram), total peripheral resistance (mean arterial blood pressure times 1334 divided by cardiac out-

put per second), coronary resistance (mean arterial blood pressure divided by coronary flow), and mechanical efficiency (cardiac work divided by KgM supplied by O₂ consumed). Following a series of determinations, a 'therapeutic dose' of ouabain was given intravenously and after thirty minutes a second series of determinations was made. Comparing the results with a series of dogs to which no drug was given, it was found that with low doses (0.026 mg/kg) the only significant change in the above list of determinations was an increase in the cardiac output. When larger doses (0.037 mg/kg) were given, there was a tendency for a rise in arterial blood pressure, an increase in total peripheral resistance and a decrease in pulse rate and there was no appreciable change in the other factors listed above.

Oral toxicity of bacitracin

HARTZELL G PAYNE,*
JOSEPH N SPENCER* AND FRED H SCHULTZ, JR
Pharmaceutical Research Division, Commercial Solvents Corporation, Terre Haute, Ind

The oral administration of bacitracin has been found to produce beneficial effects in amebiasis (Most, *N Y Acad of Med* 25 717, 1949), diarrhea in dogs (KONDE, *North Am Vet* 30 776, 1949), and in hemorrhagic dysentery in swine (GRAHAM Unpublished results). Acute and chronic toxicity studies following the oral administration of bacitracin have been conducted in mice, rabbits, and dogs. The following LD₅₀ values were obtained: mice, 510,000 units/kg; rabbits, greater than 200,000 units/kg; and dogs, greater than 400,000 units/kg. Mice tolerated the oral administration of 62,000 units of bacitracin/kg daily for 30 days. The chronic studies in rabbits were complicated by the presence of coccidiosis in the colony. Dogs were treated orally with 5,000, 10,000, and 25,000 units/kg daily for 30 days. All of the dogs survived the above treatment. There was no evidence of albumin or sugar in the dogs' urine. Microscopic examination of the urine revealed no abnormalities except in one dog. This dog received the lowest dose (5,000 units/kg) and granular and hyaline casts were observed at the end of the experimental period. In dogs, bacitracin was present in the blood following the oral administration of the above doses. Histopathological findings will be reported.

In vivo microscopic studies of intramuscular repository penicillin preparations

HAROLD M PECK (introduced by KARL H BEYER) *Dept of Pharmacology, Med Research Division, Sharp & Dohme, Inc, Glenolden, Pa*

It has been demonstrated clinically and in the laboratory that small particle crystalline procaine penicillin suspended in peanut oil and 2% aluminum monostearate, injected intramuscularly, maintains a therapeutic blood level for a

longer period than does large particle crystalline procaine penicillin suspended in the same vehicle. It has been demonstrated also that sodium penicillin suspended in peanut oil and 5% aluminum monostearate protects mice against lethal doses of pneumococcus for as long periods as does large or small particle procaine penicillin in peanut oil and 2%, or 5%, aluminum monostearate. This is contrary to the usual observation that the therapeutic activity is of much shorter duration when sodium, rather than procaine, penicillin is used. Several penicillin preparations were injected into the abdominal muscles of anesthetized mice and observed microscopically. The following observations were made: 1) As the oil vehicle is dispersed through the tissue many of the large crystals of penicillin become incompletely surrounded by the oil, while the small crystals of penicillin remain completely surrounded by oil. 2) Sodium penicillin in peanut oil and 5% aluminum monostearate formed a double emulsion consisting of the following phases: water (penicillin solution)/peanut oil/water (body fluids). The double emulsion did not form when sodium penicillin was suspended in peanut oil and 2% aluminum monostearate, or when procaine penicillin was suspended in peanut oil and 5%, or 2%, aluminum monostearate.

Analysis of regression equations for curarizing agents in man E. W. PELIKAN* AND K. R. UNNA *Dept of Pharmacology, Univ of Illinois College of Medicine, Chicago*

Analysis of calculated regression equations confirm and extend conclusions reported earlier on the effects of curarizing agents: decamethylenbis(trimethylammonium bromide) (C10), d-tubocurarine (dTC), and the dimethyl ether of d-tubocurarine (dimdTC) in four unanesthetized human subjects. Mean rates of regression (slope) of grip strength on log dose were greatest with C10, last with dTC; these equations also confirmed the observation that of the 3 drugs C10 is the most, dTC the least, potent. Variability of responses in any subject and among all subjects was greatest with C10 and least with dimdTC. Mean regression rates of decrease of vital capacity on decrease of grip strength differed insignificantly from each other and from a slope of 1.0. The thresholds of the respiratory musculature differed for each drug (lowest to C10, highest to dimdTC) and differed from the thresholds of the muscles determining grip strength for any given drug. However, once their threshold had been reached, muscles of respiration—as measured by vital capacity—became curarized at a rate equal to that of the peripheral muscles. A 'coefficient of safety' was calculated for each drug by comparing the dose required to decrease vital capacity 50% to the

dose required to decrease grip strength 95%; this coefficient for C10 was less than one and significantly lower than those for dTC (1.5) and dimdTC (3.0).

Prolongation of thiopental anesthesia by anoxia R. C. PETERSON,* F. E. SHIDEMAN AND LINARES B. JOHNSON * *Dept of Pharmacology, Univ of Michigan, Ann Arbor*

Wooster and Sunderman (*J Pharmacol & Exper Therap* 97:140, 1949) demonstrated that certain nitrites and nitrates are capable of prolonging the action of pentobarbital. They postulated that this might be due to an increased amount of drug reaching the central nervous system as a result of the vasodilating properties of the nitrites. The following experiments were performed to determine whether reduced atmospheric oxygen and methemoglobin formation would effect a similar result since anoxia appeared to be a more likely explanation of their results. Dogs were anesthetized with a standard intravenous dose of sodium thiopental (20 mg/kg). Duration of action was determined as the time required to regain the righting reflex, plasma levels of thiopental were obtained at various intervals after administration of the drug. An agent (p-aminoacetophenone) capable of producing methemoglobin (46-78%) was administered orally after a lapse of not less than 48 hours or the animal was forced to inhale an atmosphere containing 6-7% oxygen and the procedure repeated. The results demonstrate that the duration of anesthesia is prolonged markedly, the righting reflex returning at plasma levels much below (19-44%) controls. The resultant anoxia does not appear to alter the rate of detoxication of the drug as evidenced by plasma thiopental decay curves. These results demonstrate that the potentiation of barbiturate anesthesia can be accomplished by any means whereby central anoxia is produced and indicate that it is a more important factor than central vasodilatation.

Hypothermic agents. III. Effect in man CARL C. PFEIFFER, LOUIS SCHLANN* AND L. MEDUNA * *Depts of Pharmacology and Psychiatry, Univ of Illinois College of Medicine, and Manton State Hospital, Chicago*

4-amyl N-benzohydril pyridinium bromide (B-45) is completely ineffective in lowering the body temperature of the rabbit, dog and man. Doses as high as 80 mg given slowly intravenously, 160 mg intramuscularly, or 720 mg orally were ineffective in man. In contrast, Privityne (alpha naphthyl methyl imidazoline HCl) is relatively impotent in lowering the body temperature of rats and mice, but is extremely effective in higher mammals, including adult man where a 10 mg oral dose will decrease the body temperature 1

to 3°F with a mean drop of 1.3°F. This occurs at the 4th to 6th hour. Infants are more resistant to this hypothermic effect. Objective findings were slowing of the heart rate, spiking of the T wave, shortening of the P-R interval with the P wave occasionally disappearing in the QRS wave of the EKG. (These changes suggest hyperkalemia.) No changes occurred in the EEG. A rise in blood pressure of only 10 mm Hg was seen. Persistent piloerection obtained. Subjective symptoms included a feeling of coldness without shivering, persistent painful tingling of the scalp, urgency for micturition, and in some cases extreme lethargy. SAR studies suggest that this effect is produced by blocking the oxygen or muscarinic pharmacophore group of acetylcholine and the imidazoline pharmacophore group of histamine. The data suggest that lower mammals maintain body temperature through an acetylcholine-like substance, but in higher mammals this function is served by the imidazoline group of either histamine, histadine, or an unknown compound.

Adenine intoxication in relation to *in vivo* formation and deposition of 2,8-dioxyadenine in renal tubules. F. S. PHILIPS, J. B. THIERSCH* AND A. BENDICH*. *Pharmacology Section, Division of Exper. Chemotherapy, and Division of Protein Chemistry, Sloan-Kettering Inst. for Cancer Research, New York City.*

Early descriptions of extensive deposits of 2,8-dioxyadenine (2,8-DOA) in renal tubules following administration of adenine were recently confirmed (BENDICH, *et al* *J. Biol. Chem.* In press). These observations suggested that renal damage might account for stimulation of myelopoiesis as seen by others. Also a syndrome resembling B vitamin-deficiency has been reported to follow adenine-intoxication. In the present experiments the response of rats to adenine given in single or repeated doses has been studied and related to the extent of renal deposition of 2,8-DOA. Deposition has been measured by quantitative, spectrophotometric analysis and by histological study of crystal-aggregations in tubules. Daily doses of adenine eliciting little or no tubular deposition of 2,8-DOA are well tolerated without evidence of untoward histopathological changes. However, daily doses giving rise to extensive deposits in the kidney may be associated with debilitation and death. Large intratubular aggregations of crystals with inflammation and hydronephrosis occur. Moderate granulocytosis, depletion of nucleated erythroid cells in bone marrow and moderate anemia may result. Hematological changes are considered secondary to renal damage. No other lesions of significance have been found. It is, therefore, reasonable to attribute effects of prolonged administration of adenine to *in vivo* forma-

tion and tubular deposition of 2,8-DOA. No evidence has been found to support contentions that adenine stimulates hematopoiesis or acts as a vitamin-antagonist. To the contrary, administration of adenine may lead to renal impairment.

Neutralization of pit viper venom by king snake serum. V. B. PHILPOT* AND RALPH G. SMITH. *Dept. of Pharmacology, Tulane Univ. School of Medicine, New Orleans, La.*

The king snake (*Lampropeltis getulus*) is highly tolerant to water moccasin (*Agkistrodon piscivorus*) venom. By intramuscular injection one snake (wt., 470 gm.) received 140 mg. of venom in 4 doses within 5 days. Another snake (wt., 770 gm.) received 1035 mg. in 5 injections within 21 days, the largest single injection being 320 mg. The only adverse effect observed was slight swelling at the site of injection with the larger doses. Serum of the king snake detoxified by heating at 56° for 30 minutes was mixed in varying proportions with moccasin venom. On intraperitoneal injection of 15 mg./gm. of venom (approximately 2.5 LD₅₀) mixed with serum, 95, 66 and 23% of white mice were saved respectively by 0.03, 0.01 and 0.0075 cc./gm. of serum. Total doses of 1 cc. of serum (0.034–0.040 cc./gm.) counteracted 7 lethal doses of venom. In terms of lethal doses the serum was approximately as active against the more toxic venom of the rattlesnake (*Crotalus adamanteus*). Commercial antivenin used by the same techniques had a lower degree of protective action against both venoms and was more toxic than king snake serum. Heat detoxified king snake serum is well tolerated by mice in doses (0.15 cc./gm. intraperitoneally) much larger than those used above. The following intravenous doses were also well tolerated: guinea pig (399 gm.) 5 cc., rabbit (1.55 kg.) 5 cc., dog (13 kg.) 20 cc., man (91 kg.) 16.5 cc. Heating king snake serum at 56° for 30 minutes destroys its hemolyzing action on human erythrocytes.

Distribution of C¹⁴ labeled meperidine in the albino rat. NIKOLAS P. PLOTNIKOFF (introduced by HENRY W. ELLIOTT). *Division of Pharmacology and Experimental Therapeutics, Univ. of California School of Medicine, San Francisco.*

N-methyl labeled meperidine HCl has been administered by the subcutaneous route to the rat in a dose of 125 mg./kg. (1.2 × 10⁶ counts) and the distribution determined after 2 hours. The expired air contained 16.6% of the injected radioactivity indicating demethylation of the meperidine molecule. Urinary excretion amounted to 9.9%. Other organs which contained large amounts of activity were: injection site (left hind leg) 15.9%, carcass 11.0%, skin and hair 4.9%, small intestine and contents 4.5%, liver 3.7%, stomach 2.9%, and

kidney 15% Organs which contained concentrations of radioactivity appreciably above carcass level included liver, small intestine, stomach, lungs and spleen There was no concentration of activity in the brain or adrenals These data indicate that meperidine is degraded in the rat and that either meperidine or its degradation products are excreted in the urine and via the gastrointestinal route

Study of the fate of sodium-5-iodo-2-thiouracil

ALBERT I PUMMER (introduced by F F YONKMAN) *Research Dept, Division of Microbiology, Ciba Pharmaceutical Products, Inc, Summit, N J*

A study has been made of the excretion of sodium-5-iodo-2-thiouracil (originally supplied to us by Dr Frank Gassner of Colorado A & M College and reported on clinically by Dr R Williams *et al*, *J Endocrinol* 9: 801, 1949) to determine whether the iodine was removed from the compound in its metabolism Qualitative experiments in the rat, and preliminary quantitative experiments in the dog indicate that iodine is removed from the compound in both species After the administration of sodium-5-iodo-2-thiouracil to the dog orally (400-600 mg TID, 8-10 kg dogs) and intravenously (200 mg), the excretory products were quantitatively determined by the paper-chromatographic technique of Shabica and Solook (this issue) Within an hour after intravenous injection the unchanged drug appeared in the urine to be followed at the end of two hours by the appearance of 2-thiouracil The excretion of each reached a maximum within 6 hours, fell sharply at 8 hours, and had disappeared by 24 hours About 12% of the drug was recovered in 24 hours One-third of this had been metabolized to 2-thiouracil After oral dosage, excretion was more prolonged, and there was more conversion to 2-thiouracil From 11% to 41% of the administered drug was found in the urine Of this from one third to one half was converted to 2-thiouracil As after oral administration the maximum excretion occurred at 6 hours, but there was a slower drop in the excretion rate during the remainder of the 24-hour period After both oral and intravenous administration the presence of inorganic iodine in the urine gave confirmation of the splitting of iodine from the administered compound

A rapid micro method for determination of DDT and methoxychlor in animal tissues and fluids

CLAUDIA S PRICKETT,* FRIEDA M KUNZE* AND EDWIN P LAUG *Division of Pharmacology, Food and Drug Admin, Federal Security Agency, Washington, D C*

The presence of residues consisting chiefly of fatty material has been a serious restriction to the

application of the Schechter-Haller method for the determination of DDT and methoxychlor in the range of concentration of 0.1 to 10 ppm DDT Excessive amounts of fat interfere with nitration of DDT and methoxychlor, and in addition contribute nitration residues which produce yellow 'off' colors which are difficult to remove This method consists in the production of the dehydrochlorides of DDT and methoxychlor by refluxing for 30 minutes with 2% KOH in ethyl alcohol Simultaneously the fats are saponified, and the dehydrochlorides of DDT and methoxychlor are then easily separated by extraction with petroleum ether It is possible by this means to reduce 5 grams of fat to a 10-milligram residue, consisting chiefly of nonsaponifiable material which does not interfere with subsequent nitration Upon nitration the dehydrochlorides of DDT and methoxychlor are converted to the respective nitro benzophenones, which upon treatment with methylvale reagent give red colors having absorption maxima at 520 m μ for DDT and at 530 m μ for methoxychlor It is not possible by this method to separate the two insecticides, but work in this direction is in progress

Production of auricular fibrillation in the dog by dipropylene glycol methyl ether (Dowanol 50B)

LEONARD PROCITA* AND F E SHIDEMAN *Dept of Pharmacology, Univ of Michigan, Ann Arbor*

Dipropylene glycol methyl ether (Dowanol 50B)

is a central nervous system depressant of low toxicity, the degree of depression produced being proportional to the dose When administered to the unanesthetized dog in amounts as large as 5 cc/kg orally or intravenously, loss of righting reflexes and first plane anesthesia occur, with uniform recovery in 24 hours or less and without any evidence of delayed toxicity In the anesthetized dog intravenous administration produces cardiac slowing, transient hypotension and a Biot type of respiration Complete cessation of respiration will occur when doses of 0.35-0.5 cc/kg are administered The lethal intravenous dose in the artificially respired anesthetized animal is approximately 1.3 cc/kg The most interesting pharmacological action of this compound occurs in the artificially respired dog at a dose level of 0.65-0.75 cc/kg At this dosage auricular fibrillation occurs quite consistently Prior to the onset of fibrillation there is a gradual ventricular slowing followed by ventricular asystole Auricular fibrillation then ensues and within a short time an occasional ventricular beat occurs with eventual return of regular beats as the fibrillation continues The auricles may fibrillate for 4 or 5 minutes and ventricular asystole has been observed for as long as 3 minutes Fibrillation has been produced as many as 4 times in the same

animal Neither atropine nor bilateral vagotomy prior to administration of the compound will prevent the occurrence of the fibrillation

Toxicity and effects on electrolyte excretion of lithium chloride administered to dogs JACK L. RADOMSKI,* HENRY N. FUYAT,* ARTHUR A. NELSON AND PAUL K. SMITH *Division of Pharmacology, Food and Drug Admin., Federal Security Agency, and George Washington Univ. School of Medicine, Washington, D. C.*

Lithium chloride in daily doses of 50 mg/kg killed after 7 months one of two dogs on a normal diet, but 20 mg/kg daily showed no evidence of toxicity. Lithium did not accumulate in the surviving animals. The same doses given to dogs on a low salt diet produced marked evidence of toxicity and accumulation of lithium in the blood. There was loss of body weight, anorexia, salivation, weakness, muscle tremors and polyuria. Terminally there was a high blood nonprotein nitrogen and oliguria with damage of the distal convoluted renal tubules and other terminal portions of the nephrons. Lymphocytopenia developed gradually and became pronounced before death. Most of the lithium was recovered in the urine. There was an excessive sodium loss and a slight potassium retention. The serum lithium rose gradually, then more rapidly to 4 to 5 mEq/liter before death. Usually the serum sodium fell, while the serum potassium rose to 8 to 9 mEq before death. There were marked electrocardiographic changes with depressed S-T segments, inverted T waves and widening of the QRS complex. Administration of desoxycorticosterone acetate did not alter this toxicity or pattern of electrolyte excretion. After a single intravenous injection to normal dogs the apparent distribution of lithium was equivalent to about two thirds of the body weight and the renal clearances were appreciably below those of creatinine. It is apparent that in dogs the administration of lithium salts results in renal damage and consequent alterations in electrolyte metabolism.

Effect of diethylstilbestrol on respiration of cat heart tissue JOSEPH F. REILLY (introduced by OSCAR BODANSKY) *Dept. of Pharmacology, Cornell Univ. Med. College, New York City*

Diethylstilbestrol in a concentration of 2×10^{-4} M decreased significantly the respiration of slices of cat heart tissue in the absence of added glucose. In this concentration, diethylstilbestrol also inhibited the utilization of succinate, fumarate, malate and oxaloacetate. The effect of diethylstilbestrol at various concentrations on the oxidation of malate, fumarate, succinate, and oxaloacetate by homogenates was studied. In the presence of cytochrome C these oxidations were completely inhibited by diethylstilbestrol

(2×10^{-4} M). In the presence of brilliant cresyl blue, the oxidations of malate and succinate were inhibited from 0 to 50% dependent on the time of addition of the substrate and drug. Diethylstilbestrol (2×10^{-5} M) and (1×10^{-6} M) inhibited oxaloacetate oxidation less than the complete malate, fumarate or succinic oxidizing systems or a cytochrome C reductase system utilizing malate (0.02 M). The cytochrome oxidase system of cat heart was inhibited approximately 20% by diethylstilbestrol (2×10^{-1}) and added cytochrome C did not prevent this inhibition. At higher concentrations of homogenate the inhibitory effects of diethylstilbestrol in the cytochrome oxidase and on the complete succinic and malic oxidizing systems was somewhat decreased.

Metabolic action of veratrum alkaloids upon tissue of the rat heart MELCHIOR REITER (introduced by OTTO KRAYER) *Dept. of Pharmacology, Harvard Med. School, Boston, Mass.*

The right atrium of the rat heart, slit open, and homogenates of ventricle muscle were used and metabolic effects were studied using the Warburg technique. The metabolic action of veratridine differs from that of veratramine, veratrosine and pseudojervine. Veratridine, the veratric acid ester of the tertiary amine cevine, in a concentration range of 1 to 8×10^{-4} causes an increase in oxygen consumption followed by inhibition of respiration which is marked with the higher concentrations. This effect resembles that of ouabain with which veratridine shares a positive inotropic action upon the intact heart. The metabolic action of veratridine is largely dependent upon the integrity of the cell, in homogenates only a slight inhibition or no effect can be observed. In the active concentration range the secondary amine bases, veratramine, veratrosine and pseudojervine, inhibit the respiration of the atrial tissue without preliminary stimulation. These substances have no positive inotropic action in the intact heart, they antagonize the positive chronotropic effect of epinephrine. The inhibitory effect upon respiration occurs in the homogenate as well as in the 'intact' atrial tissue. Oxidation of lactic acid, pyruvic acid and fumaric acid is inhibited while anaerobic glycolysis is not influenced. The cytochrome oxidase system and succinic dehydrogenase likewise are not influenced by the secondary amines.

Kidney function and ultra short acting barbiturates R. K. RICHARDS, K. E. KUETER* AND J. D. TAYLOR* *Dept. of Pharmacology, Abbott Labs., North Chicago, Ill.*

It is generally assumed that kidney function is not important for the duration of action of ultra short acting barbiturates. This conception is largely based upon the small amount excreted

in the urine and a limited direct evidence. Rats and rabbits were used in the following experiments. Doses of Pentothal (Thiopental) and Evipal (Hexobarbital) producing similar sleeping time were injected IV. This was repeated on the same or comparable groups of animals at various intervals after bilateral nephrectomy under local or light ether anesthesia. Pentothal or Evipal injections immediately after the operation produced sleep of about the same duration as in normals or sham operated controls. However, when 3 hours had elapsed after nephrectomy rabbits showed a definite (50%) and rats a marked (100%) prolonged sleeping time with Pentothal. This became more pronounced with longer intervals. Evipal did not show this phenomenon in rats after 3 hours and only moderately so after 20 hours, it was even less evident in rabbits. An artificial NPN solution calculated to raise the blood NPN to several times the normal value was injected iv into rats immediately after bilateral nephrectomy. This caused the prompt appearance of an about 100% prolonged sleeping time after Pentothal. With Evipal such action was absent or slight. Preliminary experiments indicate that cats and especially dogs are less prone to show this change of sensitivity to Pentothal after nephrectomy.

Pharmacologic significance of m-hydroxyphenyl trimethylammonium ion WALTER F. RIKER, JR. AND W. CLARKE WESCOE *Dept of Pharmacology, Cornell Univ Med College, New York City*

m-Hydroxyphenyl trimethylammonium bromide (Nu-2561) possesses cholinergic properties. In the cat, its effects on the cardiovascular system, smooth muscle and glandular structures are weak in comparison with those of acetylcholine. However, its action on the blood pressure is characteristic in that it produces a biphasic response. This consists of an initial sharp rise terminating in an abrupt fall below the control level. The magnitude of this response is proportional to the dose, the duration of the response is fleeting. The administration of large doses accentuates and prolongs the sharp rise in blood pressure but a fall may not occur. In the atropinized cat the pronounced sharp pressor response to Nu-2561 reveals the potent action of this compound on the sympathetic vasoconstrictors. The action of Nu-2561 on neuromuscular function in the cat is most prominent and comparable to that of its acetyl ester (Nu-2017), acetylcholine and neostigmine. The close intra-arterial injection of Nu-2561 (5-10 $\mu\text{g/kg}$) in the gastrocnemius-soleus preparation, produces a rapid contractile response. A similar administration during indirect stimulation of the muscle with single maximal shocks, potentiates

the response of the muscle. The duration of this effect is brief. Doses of 50-100 $\mu\text{g/kg}$ of Nu-2561 produce a profound depression of the contractile response to nerve stimulation. The anti-curare action of Nu-2561 is equivalent to that of Nu-2017 and neostigmine. The potent stimulatory effect of Nu-2561 at the neuromuscular junction and the prominence of its pressor action in the unatropinized cat emphasize the significance of the basic structural component that endows the many derivatives of this base with their direct 'nicotinic' actions.

Anhidrotic action of agaric acid in humans MORTON L. RODMAN (introduced by THEODORE KORFANIS) *Dept of Pharmacology and Materia Medica, Georgetown Univ School of Medicine, Washington, D C*

The relative efficiency of various doses of agaric acid in thermal sweating was determined by comparing mean sweating rates during the fifth and eighth hours after ingestion of the drug with control readings of the amount of sweat collected by a gravimetric technique during one hour of exposure to heat at 104°F Dry Bulb/87°F Wet Bulb. Agaric acid in doses below 100 mg did not appear to reduce sweating significantly. Doses of 150 mg-500 mg reduced sweating from 40% to 60% below normal rates. Daily doses of 150 mg for one week suppressed sweating to the same extent, and this was followed by somewhat lower rates of sweating for a day or two after administration had been discontinued. Sweating then increased progressively to normal levels by the 4th or 5th day. In no case did these large doses produce atropine-like effects on the heart rate, eye or salivary glands or any of the symptoms of gastrointestinal irritation frequently encountered with doses as low as 30 mg of the impure resin-containing extract, agaricin, of which agaric acid is the active principle. Atropine (0.6 mg and 1.2 mg) administered alone or in addition to agaric acid (300 mg and 500 mg) resulted in inhibition of sweating not significantly greater than when effective doses of agaric acid alone were used. These preliminary observations indicate that agaric acid may prove a safe and effective anhidrotic.

Vasopressor action of pilocarpine MARY A. ROOT (introduced by OTTO KRAYER) *Dept of Pharmacology, Harvard Med School, Boston, Mass*

Although pilocarpine is generally considered to be a parasympathomimetic drug, several phenomena not explainable on this basis have been observed by various workers. We have studied the vasopressor activity in detail in an attempt to elucidate the mechanism of this action of pilocarpine. When given intravenously to rabbits, cats, or dogs under dial-urethane anesthesia pilo-

carpine produced a marked fall in blood pressure with a rapid return to normal and occasionally a secondary rise which might be quite large. After pretreatment with nicotine, curare, or tetraethylammonium ion in amounts presumed to block autonomic ganglia, an injection of pilocarpine produced a marked rise of blood pressure which was proportional to the dose of pilocarpine. The blood pressure rise was not reduced by adrenalectomy, by evisceration, by vagotomy, nor by denervation of the carotid sinus. During the blood pressure rise the heart rate either increased or decreased in cats, whereas in rabbits it always decreased. When blood flow was measured in the femoral artery of the dog using the differential manometer technique of Moe, it indicated a peripheral vasoconstriction during the blood pressure rise. After the blood pressure had returned to normal a marked vasodilatation followed. The vasopressor action of pilocarpine could be abolished completely by atropine and greatly decreased, abolished, or even reversed by ergotoxine, dibenamine, or 2-(N, p-tolyl-N(m' oxyphenyl) amino-methyl)-imidazoline (C-7337).

Relation between chemical constitution and bronchodilator activity of sympathomimetic amines

C. A. ROSS*, W. S. WALLER* AND K. H. BEYER
Dept. of Pharmacology, Med. Research Division,
Sharp and Dohme, Inc., Glenolden, Pa.

The bronchodilator activities of 27 dihydric, sympathomimetic amines have been determined by the guinea pig tracheal chain method. The following observations have been made from an analysis relating structure to activity: 1) Increasing the length of the phenylalkyl chain increased bronchodilator activity (arterenol < cobe-frine < butanefrine). 2) N-isopropyl substitution markedly increased activity in each of the 3 types. 3) Increasing the length of the phenylalkyl chain on N-isopropyl derivatives progressively decreased activity. 4) Substitution of ketone for alcoholic hydroxyl on N-isopropyl derivatives decreased bronchodilator activity. 5) With N-isopropyl ketones peak activity was observed with dihydroxy- α -aminopropiophenone. 6) In general, N-substitution of groups larger than isopropyl on the cobe-frine nucleus tended to decrease bronchodilator activity. Relative bronchodilator activities as determined by the tracheal chain and the perfused guinea pig lung methods were in fair agreement.

Effects of steroids on the isolated frog's heart

BERNARD RUBIN (introduced by WILLIAM T. SALTER) *Labs. of Pharmacology and Toxicology, Yale Univ. School of Medicine, New Haven, Conn.*

Conjugated and unconjugated steroids of the estrogen and pregnane series have been studied

on 38 isolated frog-hearts with constant perfusion (3-5 cc/min). The hearts were made hypodynamic by reducing the calcium concentration to 50% of that present in the usual Clark's solution. The steroid was added in the presence of low calcium and changes in rate and amplitude observed for 120 minutes. The pH of the solutions was 7.6-7.8 and the temperature varied between 21 and 25°C. Sodium estrone sulfate, in concentrations ranging from 25-400 μ g %, produced augmentation of amplitude. The response appeared to follow a log-concentration curve, as did the reaction time for peak response. The latter varied from about 110-40 minutes for the concentration-range indicated. A cardiotonic response in the presence of normal calcium concentration was also observed, but this was apparent only when compared with control hearts similarly perfused in the absence of the steroid. Estrone in concentrations of 100 and 200 μ g % produced little or no augmentation. Other steroids were tested similarly. For example, progesterone in a concentration of 25 μ g % produces augmentation. With 50 and 400 μ g %, however, a bradycardia and some increase in amplitude are observed. Pregnandiol glucuronide, in concentrations below 25 μ g % appeared to produce a considerable augmentation without bradycardia. Concentrations of 25 to 200 μ g %, however, produced only slight increases in amplitude with an almost immediate bradycardia.

Studies on carbohydrate metabolism of the rabbit ileum

P. R. SALERNO*, L. G. ABOOD* AND J. M. COON
Univ. of Chicago Toxicity Lab. and Dept. of Pharmacology, Chicago, Ill.

An attempt is being made to correlate changes in the functional capacity of the isolated rabbit ileum with alterations in its carbohydrate metabolism. Analyses of phosphorylated intermediates were made on ileum of rabbits starved for 48 hours. Although the glycogen content did not differ significantly from the normally fed animals, the inorganic phosphorus content remained high, suggesting a high rate of glycolysis. This was further indicated by a high lactic acid content and by *in vitro* studies on glycolysis from glucose of ileum homogenates. Phosphocreatine and ATP were high, whereas fructose phosphates were low. The ability of washed ileum homogenates to oxidize several substrates was determined manometrically. Malate, pyruvate and fumarate were oxidized readily (QO₂ 10-16) even after the homogenate was stored at 0 degrees for 3 days. Succinate and ketoglutarate were oxidized only slightly (QO₂ 3-5) the first day and not at all on the second day. Oxidative phosphorylation of the isolated ileum proceeds much more rapidly with pyruvate as a substrate than with glucose. With pyruvate as a substrate most of the pyrophos-

phate was in the form of ATP. It is conceivable that the immediate increase in tone elicited upon the addition of pyruvate to starved isolated rabbit ileum is associated with the rapid formation of ATP. The phosphocreatine content increased over 100% above that of the normal starved ileum when these substrates were added to the bath.

Effects of beryllium chloride in Locke-Ringer solution upon the isolated rabbit ileum and heart

P. R. SALLERNO*, L. E. ELLIWOOD*, L. G. ARON* and J. M. COON. *Univ. of Chicago Toxicity Lab. and Dept. of Pharmacology, Chicago, Ill.*

Beryllium chloride ($1 \times 10^{-3}M$) caused a fleeting decrease in tone and decreased survival time of isolated rabbit intestine. A concentration of $5 \times 10^{-3}M$ abolished all activity in 1 minute. The isolated heart showed a temporary decrease in amplitude following single injections of 1 to 2 mg $BeCl_2$. It was noted that a precipitate, probably $Be(OH)_2$, varying in quantity with the amount of $BeCl_2$ added, was formed in the Locke-Ringer solution. If the concentration of sodium bicarbonate was decreased below the normal level of 50 mg %, less precipitate was formed and the sensitivity of the isolated ileum to $BeCl_2$ was increased. The effects of $BeCl_2$ could be reversed by flushing the bath with fresh Locke-Ringer solution or by the addition of sodium bicarbonate. These observations suggested that these actions of $BeCl_2$ were due to removal of bicarbonate from the Locke-Ringer solution, with consequent destruction of its buffering power. Titration studies revealed that 1.6 moles of sodium hydroxide were necessary to neutralize a solution of one mole of $BeCl_2$ to pH 7. It was found that all of the effects of $BeCl_2$ described above were comparable to the effects of HCl of 1.6 times the molar concentration of $BeCl_2$. Since concentrations of $BeCl_2$ which do not materially affect the pH of Locke-Ringer solution lack any influence on the behavior of the isolated intestine and heart, and since the pH of solutions of greater concentrations of $BeCl_2$ are not compatible with normal function, it has not been found possible to demonstrate any direct pharmacologic action of $BeCl_2$ in these systems.

Nomogram for cardiac synergism of calcium potassium and digitalis bodies (in "therapeutic" concentrations) WILLIAM T. SALTER, BERNARD RUBIN* and ELIZABETH A. RUNELS*. *Labs. of Pharmacology and Toxicology, Yale Univ. School of Medicine, New Haven, Conn.*

Positive and negative synergisms of calcium and potassium ions have been measured concomitantly on the frog heart under the influence of digitalis bodies in 'therapeutic' concentrations. The resulting four-dimensional diagram is conveniently epitomized at the 50 percentile level

of maximal contractile force. The relationship is described approximately by the following equation: $1/b \left(\frac{R}{100R} - 1 \right) = k[G] + C_1[Ca^{++}] - C_2[K^+] - a$, where R is the contractile response in percentage of maximum, and $[G]$, $[Ca^{++}]$, and $[K^+]$ represent the respective concentrations of glucoside and ions. The constant a is characteristic for each heart at physiological acidity and the temperature designated. This nomogram can be used to standardize the potency of cardiac glucosides in terms of molar equivalents of inorganic ions. With the help of buffered sodium citrate it can also be applied to serum. The simultaneous control of $[Ca^{++}]$ and $[K^+]$ increases the flexibility of the procedure. The results emphasize the analogy of digitalis bodies to cardiac vitamins or hormones.

Effect of tetraethylthiuram disulfide (Antabuse) on the metabolism of isopropyl alcohol. R. W. SCHAFFERZICK (introduced by P. J. HANZLIK). *Dept. of Pharmacology and Therapeutics, Stanford Univ. School of Medicine, San Francisco, Calif.*

The effect of tetraethylthiuram disulfide on blood alcohol was studied in rabbits. Tetraethylthiuram disulfide was given gastrically, 0.5 gm/kg twice daily to 2 rabbits, and 0.5 gm/kg 3 times daily for 2 days to 2 other rabbits. Three hours after the last dose, all 4 rabbits and 2 untreated controls were given isopropyl alcohol, 1250 mg/kg. Blood alcohol and blood acetone were determined at intervals to 20 hours. While the control rabbits remained alert and responsive, the tetraethylthiuram disulfide treated animals showed marked motor depression within 10 minutes after giving the isopropyl alcohol, and 5 of the 4 tetraethylthiuram disulfide treated rabbits died within 48 hours. There were no significant differences between the curves of blood alcohol of the control and premedicated rabbits and the combination of tetraethylthiuram disulfide and isopropyl alcohol did not increase the blood acetone above that of the animals receiving isopropyl alcohol alone. Thus, while the combination of Antabuse and isopropyl alcohol is more toxic than is this secondary alcohol alone, the rate of oxidation of this alcohol is not demonstrably altered, contrary to recent claims (Larsen *Acta Pharmacol.* 4:321, 1948) for ethyl alcohol (primary) given under similar conditions.

Cardiac action of nitrogenous lactones. F. W. SCHUELER and C. C. HANNA*. *Dept. of Pharmacology, College of Medicine, State Univ. of Iowa, Iowa City*

Using a frog heart perfusion technique similar to that described by Giarman (*J. Pharmacol. &*

Exper Therap 96 119, 1949) we have tested four series of unsaturated lactones (I-IV) synthesized in our laboratory under a grant from the USPHS R_1 = 2-fluorenyl-, 3-diphenylene oxide-yl, 2-(5,6,7,8-tetrahydronaphthyl)-, 2-pyrenyl-, phenyl-, and substituted phenyl derivatives as follows p-chloro-, p-bromo-, p-acetyl-amino-, p-phenoxy-, 2,4 dimethyl-, 2,5-dimethyl-, p-methyl- R_2 = furyl-, β -furylvinyl-, phthalyl-, phenyl-, β -phenylvinyl-, α -methyl- β -phenylvinyl-, and substituted phenyl derivatives as follows p-dimethyl-amino-, 3,4-methylenedioxy-, 2,3 dimethoxy-, 4-methoxy-, 3-chloro-4,5-dimethoxy-, p-acetoxy-, 2,6-dichloro-, 2-nitro-, 3-nitro-, 4-nitro-, 2-chloro-, 4-methyl-, 4-isopropyl-, 3-acetoxy-, 3,4-diethoxy- R_3 = phenyl-, 2-hydroxyphenyl-, 4-methoxyphenyl-, β -phenylvinyl- Group II was synthesized as a control series in the study of III Cardiac digitals like activity followed a virtually identical pattern in series II and III Thus, the 3,4 methylenedioxyphenyl-, 3-nitrophenyl-, and furyl derivatives of both II and III were active materials All other derivatives in II and III showed either no or very low activity All compounds termed 'active' were capable of restoring the ventricular amplitude of 3 out of 4 hypodynamic hearts to 75% or more of their normal amplitude in 20 minutes at a concentration of 1 mg % in the low calcium solution In series I only the phenyl-, p-chlorophenyl-, and p-bromophenyl-, derivatives showed activity None of the derivatives of IV possessed activity, though this series is very incomplete As a result of this study it appears that the cardiac 'digitals' like action of the nitrogen analogues III of the lactones II are qualitatively and quantitatively similar And all the carbon-unsaturated lactone ring, therefore, does not appear essential, at least, when the nitrogen atom is not linked directly with the ester-oxygen as in IV

Comparison of seven vaso-pressor compounds

LLOYD D SEAGER AND WILLIAM WEISS * *Dept of Physiology and Pharmacology, Univ of Arkansas, Little Rock, and the Dept of Anesthesiology, Woman's Med College of Pennsylvania, Philadelphia*

The study was made on vagotomized dogs under phenobarbital and nembutal anesthesia Forced artificial respiration was maintained to nullify respiratory effects of the drugs Epinephrine, Neosynephrine, Nu1683, Aramine, Oenethyl, Ve-250 and Desoxyephephrine were the drugs studied The latter 3 compounds show cross tachyphylaxis and the comparisons on these were made chiefly on litter mate pups using the result of first injection only Comparisons of drugs not showing tachyphylaxis was made in part by several injections in the same animal, and rotating the order

of injection in different animals Aramine and Nu1683 were found not to exhibit tachyphylaxis and to give more prolonged effects than neosynephrine Using approximately equivalent epinephrine pressor ratios the order of duration of response were epinephrine, neosynephrine, Nu-1683, Oenethyl, Aramine, Desoxyephephrine and Ve250

Method of screening steroids on synovial membrane for possible anti-arthritic action JOSEPH SEIFTER, DAVID H BAEDER,* ALBERT J BEGANY,* GEORGE ROSENKRANZ,* CARL DJERASSI,* JOHN PATAKI* AND STEPHEN KAUFMANN * *Wyeth Inst of Applied Biochemistry, Philadelphia, Pa, and Syntex, S A, Mexico*

Hyaluronidase and steroids alter the permeability of certain membranes, particularly the synovial membrane, by acting upon the hyaluronate of the ground substance (SEIFTER, BAEDER AND DERVINIS *Proc Soc Exper Biol and Med* 72 136, 1949, SEIFTER, BAEDER AND BEGANY *Ibid* 72 277, 1949) Of the physiological steroids cortisone is the most efficient in decreasing permeability Adrenocorticotrophic hormone (ACTH) has the same effect as cortisone Desoxycorticosterone (DCA), on the other hand, increases permeability, as does hyaluronidase Both simulate the initial lesion of rheumatoid arthritis Cortisone and ACTH are effective against the action of DCA and hyaluronidase Forty steroids (kindly supplied by Dr I V Sollins of the Chemical Specialties Co, Inc) and some of their esters have been screened on the rabbit synovial membrane for 1) effect on permeability, 2) anti-hyaluronidase effect and 3) anti-DCA effect These steroids have a pharmacological rather than physiological effect on the synovial membrane Several steroids were as effective as cortisone in their ability to decrease permeability and in their anti-hyaluronidase and anti-DCA action The most interesting of these were related to DCA by chemical structure, suggesting a basis for competitive inhibition Δ^4 Pregnene-3 β , 21-diol, 20-one, 21-monoacetate had a cortisone ratio of 130% and was 5 times as effective against DCA as against hyaluronidase In clinical trials it was a useful anti-arthritic DCA structure is not essential either for anti-hyaluronidase or anti-DCA action, or for clinical efficiency

Quantitative chromatographic method, applicable to body fluids, for the determination of 2-thiouracil and 5-iodo-2-thiouracil singly or in mixtures ANTHONY C SHABICA AND EDWARD SOLOOK (introduced by E OPPENHEIMER) *Research Dept, Division of Development Ciba, Pharmaceutical Products, Inc, Summit, New Jersey*
Although the 'Grote' spectrophotometric procedure for the determination of total thiouracil in body fluids has been reported by McGinty et

al and Williams *et al*, no method has been available for a quantitative analysis of the individual components of a mixture. The method described has been devised in order to permit an elucidation of the metabolism of 5-iodo-2-thiouracil. Since the spectrophotometric method does not differentiate between 2-thiouracil and 5-iodo-2-thiouracil, a 'paper chromatographic' method has been developed. Using the ascending technique and developing with aqueous butanol, the above compounds ascend to spots sufficiently apart to effect an excellent and reproducible separation. The ratio of distance travelled and solvent front, R_f values, are 0.50-0.53 and 0.67-0.70 for 2-thiouracil and 5-iodo-2-thiouracil, respectively. The method of detection of the separated compounds is accomplished by spraying the paper chromatogram with 'Grote's' reagent, a blue color appearing for 2-thiouracil and blue-green for 5-iodo-2-thiouracil. An alternative method is based on the observation of Holiday and Johnson, that in the presence of ultra-violet light (230-400 $m\mu$) the thiouracils appear as dark spots. Quantitative analysis is accomplished by streaking an aqueous solution of the mixture on a line of application rather than spot preparatory to development. The paper is cut into strips containing the individual thiouracils and eluted with water for 48 hours and the eluate analyzed spectrophotometrically via the 'Grote' method. Satisfactory results on the quantitative determinations of the above compounds, $100 \pm 5\%$ have been obtained.

Pancreatic secretions and response to secretin after vagotomy and sympathectomy WILLIAM W. SHINGLETON, BLAKE FAWCETT AND J. STANLEY VETTER (introduced by K. S. GRIMSON)
Dept of Surgery, Duke Univ School of Medicine, Durham, N. C.

Experiments were carried out to measure pancreatic function in fasting normal patients and in patients after vagotomy or transthoracic sympathectomy with splanchnicectomy. A specially designed triple lumen tube, with one balloon at the tip and another 18 cm proximally, was passed through the pylorus of the stomach. Proximal and distal balloons were inflated, the former resting in the pylorus, and the latter in the lower duodenum. Specimens were collected from the portion of duodenum between the balloons. A 30 minute sample of secretion was obtained before and after intravenous injection of secretin (1 unit/kg secretin, Eli Lilly and Co). Measurements of total volume, amylase, and NaHCO_3 , were made on the samples collected. In 4 normal patients the average volume of secretion before secretin was 93 cc, and after secretin, 118 cc. The average total output of amylase units (1 unit = 1 gm starch digested 1 hr) before secretin was 88, and

after secretin, 1500. The average bicarbonate value was 4 cc 1 N NaOH per cc of secretion before secretin. One of the normal patients whose amylase value was 96 units before and 3424 after secretin underwent a transthoracic sympathectomy with splanchnicectomy for hypertension. One week later studies showed 570 amylase units before and 1120 units after secretin. Bicarbonate value before operation was 0.9 cc 1 N NaOH /1 cc secretion, and this value was zero following operation. By contrast, five patients tested three to four years after transthoracic vagotomy for ulcer showed an average of 300 amylase units prior to and only 360 units after secretin.

Studies on the 17-ketosteroid excretion, gonadotrophic inhibition and response of rat seminal vesicle following oral and parenteral administration of testosterone and testosterone propionate in different vehicles BETTY M. SILVER, HERBERT S. KUPPERMAN AND RALPH A. POSTIGLIONE (introduced by ARTHUR C. DEGRAFF)
Dept of Therapeutics, New York Univ College of Medicine, New York City

The comparative efficacy of testosterone and testosterone propionate in various vehicles was evaluated by a study of 17-ketosteroid excretion in man, and by gonadotrophic inhibition and stimulation of the male accessory glands in the rat. The 17-ketosteroid determinations utilizing the Zimmerman reaction were made on urines obtained from a series of hospitalized patients after parenteral administration of the hormones in oil and as aqueous suspensions, and after oral administration as colloid mixtures. These excretion studies did not indicate the superiority of either vehicle or route of administration, inasmuch as comparable increases in 17-ketosteroid excretion were observed following both oral and parenteral administration. Studies on the ketosteroid excretion following the administration of testosterone propionate in the form of rectal suppositories failed to show an increased excretion over initial control values. The gonadotrophic inhibiting effect of the androgens was measured in parabiotic rats by parenteral administration of testosterone and testosterone propionate in oil or as an aqueous suspension to the castrate partner of littermate parabionts. Testosterone in sesame oil or an aqueous suspension was not as effective in inhibiting the gonadotrophic complex as similar preparations of testosterone propionate. The effect of equivalent doses of the 6 parenteral preparations on the seminal vesicles of the castrate male rat showed that there was a decrease in potency and effectiveness of the compounds in the following order: testosterone propionate aqueous suspension, testosterone aqueous suspension,

testosterone propionate in oil and testosterone in oil. The duration of effect was sustained for a longer period of time with testosterone propionate in an aqueous suspension. Testosterone in oil produced only minimal growth effects on the male accessories and these in turn were rapidly dissipated.

Action of Neo-Coronaril, Erba, upon induced ventricular fibrillation DONALD SLAUGHTER AND J BELOGORSKY * *Dept of Physiology and Pharmacology, Univ of South Dakota, Vermillion*

Studies were made with diethyl-amino ethoxy-4 stilbene-Neo Coronaril-(NC) to determine its ability in preventing the onset of ventricular fibrillations, induced by a chloroform-epinephrine method in dogs as described by Shen and Simon (*Archives Internationales de Pharmacodynamie*, 1938 Vol 59, p 68). Eighteen dogs, weighing from 6.5-28 kg, anesthetized with sodium-pentobarbital, were divided into 4 groups. Using the method referred to, fibrillation occurred in the first group of 9 animals which were used as a control. In the second group of 3 dogs (NC) as the protective drug was injected intravenously, 15 mg/kg (standard used in this study), one-half minute before the epinephrine. In this series no fibrillation occurred. In the third group of 3 dogs (NC) and epinephrine were injected simultaneously, in 2 animals the onset of fibrillation was delayed for approximately 3 minutes, and in one the fibrillation was not checked at all. In the fourth group of 3 dogs (NC) was injected immediately at the onset of fibrillation and no protective action was noted. The results of the experiments indicate that (NC) possesses positive anti-fibrillatory action in dogs if used previously to the agent producing fibrillation (NC) when administered simultaneously with the fibrillatory agent is of questionable value. Finally, (NC) is ineffective if used when the fibrillation is already in progress.

Chemical constitution and analgetic action M B SLOMKA* AND F W SCHUELER *Dept of Pharmacology, State Univ of Iowa, College of Medicine, Iowa City*

Using a rat tail modification of Wolf *et al* technique we have tested 5 types of amine derivatives, most of which are new compounds, synthesized in our laboratory. These materials embraced the following compounds given together with the mean % increase in time for the tail twitch over control time, confidence limit and dosage. (A) 1) 2-phenyl-1-methyl-ethyl-N-methyl-N-(2-acetoxyethyl) amine HCl, 34.3%, 1%, 100 mg/kg, 2) 2-phenyl-2-methyl-ethyl-N-methyl-N-(2-acetoxyethyl) amine HCl, inactive, 200 mg/kg, 3) 2-phenyl-2-methyl-ethyl-N-methyl-N-(3-acetoxypentyl) amine HCl, 17.2%, 1%, 100 mg/kg. (B) 1) N-(2-acetoxyethyl)-1,2,3,4-tetrahydroiso-

quinoline HCl, 44.6%, 2%, 75 mg/kg, 2) N-(2-acetoxy-ethyl) isoquinolinium bromide, inactive, 100 mg/kg. (C) 1) 2-phenyl-2-acetoxy-dimethylaminomethyl cyclohexane HCl, inactive, 100 mg/kg, 2) 2-phenyl-2-acetoxy-diethylaminomethyl cyclohexane HCl, 17.6%, 1%, 25 mg/kg and 52.5%, 1%, 50 mg/kg. (D) 1) morphine sulfate, 102.7%, 1%, 2 mg/kg, 2) morphine methiodide, 103%, 0.1%, 2 mg/kg. (This material was supplied to us by Dr L F Small.) (E) 1) N-phenacyl-N,N-dimethyl-N-(2-hydroxy propyl) ammonium bromide, inactive, 25 mg/kg, 2) N-phenacyl-N,N-diethyl-N-(2-hydroxy ethyl) ammonium bromide, inactive, 10 mg/kg, 3) N-phenacyl-N-methyl morpholinium bromide, inactive, 50 mg/kg, 4) N-phenacyl-4-(γ-hydroxy propyl) pyridinium bromide, inactive, 50 mg/kg. Higher doses than those given in this last group were too toxic for further investigation. The results of this preliminary study lend support, in general, to a qualitative working hypothesis developed previously in our laboratory concerning the relationship between chemical constitution and analgetic action (*J Am Pharm A* 38 74, 1949).

Toxicity and irritation studies on some organic mercurial diuretics J K SMITH,* R E BRIDENSTINE,* C R THOMPSON* AND H W WERNER *Pharmacology Dept, Wm S Merrell Co, Cincinnati, Ohio*

TMS (trisodium salt of N-(2-methoxy-3-(1,2-dicarboxyethylthiomercuri) - propyl) - 0 - carboxymethyl salicylamide), a new thiomercureal, has been compared to meralluride sodium and mercaptomerin sodium with respect to local irritation and acute and chronic toxicity. Continuous intravenous infusion to the point of death in dogs demonstrated meralluride sodium to be significantly more toxic than TMS and mercaptomerin sodium. Intramuscularly in rats and subcutaneously in mice the local irritant effects of TMS and mercaptomerin were similar and less than those of meralluride sodium. The acute 14-day LD₅₀ values expressed as mg of Hg/kg for TMS, meralluride sodium and mercaptomerin sodium were respectively 16.6, 8.6, and 6.7 for i.v. administration to rabbits and 15, 10, and 5 for i.m. administration to rats. TMS and mercaptomerin sodium were administered s.c. to rats and i.v. to rabbits every third day for 8 weeks in doses of 0.7 and 3.5 mg of Hg/kg. Signs of toxicity were not observed in the rats or in rabbits at 0.7 mg of Hg/kg, however, in rabbits at 3.5 mg of Hg/kg both compounds caused upper nephron nephrosis and a vacuolization of the parenchymatous cells of the liver. The histologic alterations in the kidneys were more severe in the mercaptomerin sodium group than in the TMS group. Similar chronic toxicity studies on meralluride sodium are in progress.

Morphological and biochemical changes produced by infectious myxoma virus in chorioallantoic membrane of the developing chick embryo
MARGARET H. D. SMITH* AND ERNEST KUN
Depts. of Pediatrics and Medicine, Division of Infectious Diseases, Tulane Univ., New Orleans, La

The chorioallantoic membranes of developing chick embryos have been inoculated with measured amounts of infectious myxoma virus. The pathogenesis of the ensuing lesions has been studied serially at intervals of a few hours and the titer of virus, histopathological changes and some metabolic disturbances were determined. During the early stage of infection, at the time of most rapid virus multiplication, brilliant acidophilic inclusion bodies appear in almost all the cells of the ectodermal layer. With slightly more delay, marked cellular proliferation develops in all 3 layers of the membrane, also endarteritis and thrombosis of the capillary vessels. After the virus has reached its maximum titer, the inclusion bodies diminish in number and become weakly basophilic, there is some necrosis and a gradual return to a more normal histological pattern. The respiration in Krebs-Henseleit solution, containing glucose, the aerobic lactate formation, the fermentation of hexosediphosphate to diphosphoglycerate, the zymohexase activity and sulfhydryl content of infected and normal membranes was determined in intervals from 2 hours after inoculation till the complete development of the embryo. The first measurable effect was on activation of zymohexase, then increased hexosediphosphate fermentation and an increase in aerobic lactate formation. Respiration was slightly inhibited only 14 days after inoculation of the virus. Correlation was found between metabolic effects and sulfhydryl content. Starting at 48 hours, a marked decrease in sulfhydryl groups occurred in the inoculated membranes.

Biochemical changes in the liver produced by chemical intoxication
H. C. SPENCER AND NORABELLE T. WILLIAMS (introduced by D. D. IRISH)
Biochemical Research Lab., Dow Chemical Co., Midland, Mich

In these studies it has been demonstrated that biochemical changes in the liver furnish reliable criteria for the evaluation of the effects produced by chemical intoxication. In laboratory animals that received repeated exposures to graded vapor concentrations of ethylene dichloride, trichloroethylene, tetrachloroethylene and carbon tetrachloride quantitative determinations of the following constituents of the liver have been made: total lipid, phospholipid, neutral fat, cholesterol fractions, water, nitrogen, sulfur, phosphorus, and collagen. Changes in these

constituents of the liver have been correlated with the type and extent of histopathological effects produced. As an example, the typical fatty changes observed histologically in the liver of animals exposed to carbon tetrachloride have been correlated with an increase in total lipid, due in a large measure to an increase in neutral fat and esterified cholesterol.

Neomycin toxicity studies
JOSEPH N. SPENCER,*
HARTELL G. PAYNE* AND FRED H. SCHULTZ,
JR.
Pharmaceutical Research Division, Commercial Solvents Corp., Terre Haute, Ind

Toxicity studies have been conducted with neomycin, a new antibiotic first described by Waksman (*Science*, 109, 305, 1949). The preparation employed was the neomycin sulfate. These preparations were pyrogen free and devoid of any significant pressor or depressor effects in anesthetized dogs. The following LD₅₀ values were obtained in mice: intravenous, 4,450 units/kg; intraperitoneal, 35,000 units/kg; subcutaneous, 36,000 units/kg; oral, greater than 865,000 units/kg. In rats the subcutaneous LD₅₀ was 92,000 units/kg and oral LD₅₀ was greater than 865,000 units/kg. Mice were given daily subcutaneous doses of 18,000, 9,000, 4,500 units/kg for 30 days. All animals survived the lower doses and 90% survived the highest dose. Four dogs were injected intramuscularly with 2000 units/kg every 6 hours for 8 days. Neomycin blood level determinations indicated that continuous blood levels were maintained in 2 animals. No toxic symptoms were observed and there were no alterations in the hematology, and urine and blood chemistry. Histopathological findings will be reported.

Dosage—reversal of effects of acetylcholine and of adrenaline, as observed in submaxillary salivary gland of cat
G. W. STAVRAKY AND A. R. GRAHAM*
Dept. of Physiology, Univ. of Western Ontario, Faculty of Medicine, London, Canada

It is known that under the influence of amyl nitrate, bleeding and other conditions which tend to lower blood pressure, the vasomotor effect of chorda tympani stimulation may be reversed, the chorda causing a diminution of the blood flow through the submaxillary salivary gland instead of the usual vasodilatation (FRÖHLICH AND LOEWI, 1906; DALE, 1930; STAVRAKY, 1934). Using the intra-arterial route (anterior lingual artery), it was found in the present investigation, that in cats under chloralose and urethane (1:10) anaesthesia, acetylcholine bromide injected in 10⁻⁴—10⁻⁷ quantities, produced pure vasodilatation in the submaxillary gland, while, when introduced in greater quantities (20–200 γ) it caused vasoconstriction. In both cases a secretion of saliva could be evoked. Eserinization of the gland or intra-

venous injection of eserine facilitated the appearance of the vasoconstrictor effect of acetylcholine and when sufficient quantities of eserine or acetylcholine were injected a reversal of the vasomotor effect of chorda tympani stimulation also took place. Atropinization abolished these vasoconstrictor effects. Similarly intra-arterial injections of small quantities of adrenaline hydrochloride (10^{-10} – 10^{-2} γ) had a vasodilator effect, while larger amounts (10^{-1} – 5γ) produced prolonged vasoconstriction in the submaxillary gland. It was possible to demonstrate with the present technique that while low blood pressure has a predisposing effect on these reversals, the latter could be produced at ordinary blood pressure levels and depended upon the quantity of the injected chemical agents. These observations fit in with other instances of reversal of the effect of acetylcholine described in recent years (SPADOLINI AND DOMINI, 1940, McDOWALL, 1946, BULBRING AND BURNS, 1949, BURN AND VANE, 1949 *et al*).

Action of veriloid upon isolated mammalian heart

NORMAN S STEARNS (introduced by J W STUTZMAN) *Dept of Pharmacology, Boston Univ School of Medicine, Boston, Mass*

This report deals with the investigation of the inotropic, chronotropic and dromotropic effects of Veriloid (J W Dart Labs' purified, reproducible extract of *Veratrum viride*). Sixty-four rabbit hearts were perfused with Locke's solution using a modification of Langendorff's technique. Inotropism was interpreted from isotonic contractions of the heart recorded on Teledeltos paper using a lever attached to the left ventricle. Rate and rhythm were recorded with a visio-cardiette under controlled conditions of temperature and pressure. Satisfactory volume and solvent controls were done. Both positive and negative inotropic actions of Veriloid have been demonstrated. Both moderate Stat doses (up to $10\mu\text{g}$) injected rapidly close to the heart and moderate concentrations (up to $0.075\mu\text{g/cc}$) perfused continuously produce positive inotropism. Effective dose ranges appear to be within probable effective ranges for hypotension in intact dogs and in man. Bradycardia has not been demonstrated with Veriloid in the isolated rabbit heart. Tachycardia has been observed with high Stat doses and with relatively high concentrations (over $0.1\mu\text{g/cc}$) of continuously perfused Veriloid. Inotropic and chronotropic effects may occur independently of each other. Arrhythmias are produced by continuous Veriloid perfusion in high concentrations (over $0.3\mu\text{g/cc}$).

Cardiovascular aspects of acute cocaine intoxication JOHN E STEINHAUS (introduced by A L TATUM) *Dept of Pharmacology, Univ of Wisconsin Med School, Madison*

From a study of the prophylactic use of barbiturates in cocaine intoxication it became evident that the cardiovascular system is involved to a much greater degree than has generally been supposed in the 'slower type' of intoxication. These effects were studied on dogs and rabbits by means of electrocardiograms and blood pressure tracings taken during the administration of cocaine. The marked variation seen clinically and experimentally can be explained in part by variations in absorption. For this reason cocaine was administered intravenously by a motor-driven mechanical injector. Rapid rates of injection, 15 mg/kg/min, caused almost simultaneous cardiovascular and respiratory failure. Rates of 3-4 mg/kg/min produced death by cardiovascular failure and rates of 2.5 and lower caused primarily respiratory failure. Failures of both systems were often seen at rates between the 2 lower figures. Barbiturate antagonism of cocaine intoxication was studied by treating 4 groups of 5 dogs each with doses of 0, 5, 15, and 30 mg/kg of pentobarbital *iv* followed by the administration of cocaine, 2.25 mg/kg/min, until respiratory arrest occurred. The groups receiving 15 and 30 mg/kg of pentobarbital developed no signs of central nervous system stimulation, however, a marked cardiovascular deficiency appeared as indicated by very low blood pressures at respiratory arrest. This could be combatted with small doses of epinephrine suggesting the utility of epinephrine and related drugs in the barbiturate treatment of local anesthetic intoxication.

Hypotensive action of Veriloid, an extract of *Veratrum viride* J W STUTZMAN AND GEORGE L MAISON *Dept of Pharmacology, Boston Univ School of Medicine, Boston, Mass*

Veriloid (J W Dart Labs, Los Angeles) is a purified, reproducible extract of *Veratrum viride*. None of the previously described potent alkaloids have been obtained by its fractionation. Normotensive dogs anesthetized with pentobarbital sodium have been used in the studies of its hypotensive effects. Linear dose-response relationships were found with 151 Stat injections of 1 to $12.5\mu\text{g/kg}$ and with 400 10-minute infusions of 0.25 – $3\mu\text{g/kg/min}$. With an infusion of $1\mu\text{g/kg/min}$ for 10 minutes the average decrease in mean arterial blood pressure was $29.9 \pm 12\%$ in 232 administrations. The hypotensive action of Veriloid was not altered quantitatively by any of the following procedures: 1) complete atropinization (11 animals), 2) bilateral cervical vagotomy (25 animals), 3) bilateral carotid sinus and body denervation (10 animals). Veriloid caused a further fall in blood pressure when administered to 9 animals during the period of hypotension resulting from 20 mg/kg of tetraethylammonium chloride.

This latter drug was sufficient to block the bradycardia from peripheral vagal stimulation and the pressor response from bilateral carotid sinus occlusion. Veriloid lowered the blood pressure of 21 dogs made hypertensive by acute section of all the buffer nerves.

Action of tetraethylammonium bromide and acetylcholine on the kitten phrenic nerve-diaphragm preparation WALTER J. SULLIVAN* AND CHARLES J. KENSLE, *Dept. of Pharmacology, Cornell Univ. Med. College, New York City*

Tetraethylammonium bromide (TEA) restored the response of the rat diaphragm to phrenic nerve stimulation at rates of 5 and 30/min when failure was produced by maintenance in calcium free Ringer-bicarbonate solution, provided sufficient calcium ($\text{ca } 4 \times 10^{-4} \text{ M}$) had been added to permit minimal activity (KENSLE, *Federation Proc.* 8: 307, 1949). Although the calcium threshold for minimal activity was essentially the same for the kitten as for the rat diaphragm, TEA was less effective in restoring function to the kitten preparation (to 45-65% of normal) than to the rat (85-105%). For the kitten maximal calcium 'replacement' was achieved by concentrations of TEA $\text{ca } 7 \times 10^{-4} \text{ M}$. Further increase in TEA concentration decreased the response. The addition of TEA ($1 \times 10^{-3} \text{ M}$) to the kitten preparation in normal calcium Ringer markedly increased the muscle response to nerve stimulation as reported earlier by Ing and Wright (*Proc. Roy. Soc. London, B* 109B: 337, 1931) for a frog nerve-muscle preparation. The response of the kitten diaphragm to nerve stimulation was potentiated by low concentrations of diisopropyl fluorophosphate (DFP) and was reversibly blocked by higher concentrations ($\text{ca } 2.5 \times 10^{-3} \text{ M}$) as had been found for the rat (KENSLE AND BERRY, *Federation Proc.* 8: 307, 1949). Acetylcholine ($1-2 \mu\text{g/ml}$) blocked the response to nerve stimulation in the presence of low concentrations of DFP or after exposure to high concentrations ($2.5 \times 10^{-3} \text{ M}$). After recovery from a DFP-acetylcholine block, low doses of acetylcholine ($\text{ca } 0.1 \mu\text{g/ml}$) usually produced a sustained potentiation of the response of the diaphragm to nerve stimulation. Higher doses decreased the response.

Anticonvulsant properties of optical isomers of nirvanol and mesantoin EWART A. SWINYARD, JACK E. ORR,* JOEL M. JOLLEY* AND LOUIS S. GOODMAN, *Depts. of Pharmacy, Pharmaceutical Chemistry, and Pharmacology, Univ. of Utah College of Pharmacy, and College of Medicine, Salt Lake City*

Optical isomers of Nirvanol and Mesantoin (prepared by J. J. Spurlock, North Texas State College) and Nirvanol (prepared by J. E. Orr)

were tested for their ability to modify maximal electroshock seizure pattern and prevent Metrazol convulsions in rats. Drugs were given orally in a 10% acacia suspension and tested at the time of peak drug effect. Anticonvulsant potencies (ED_{50}) and minimal neurological toxicity (TD_{50}) were determined and protective indices calculated ($\text{TD}_{50}/\text{ED}_{50} = \text{P.I.}$). The data indicate that neither toxicity nor anticonvulsant activity resides exclusively in one isomer. The levo forms were the more active except in the case of antielectroshock potency of Mesantoin. For Nirvanol the racemic mixture showed greater activity than that calculated from the isomers.

Studies on cardiovascular actions of adenylic compounds VIRGINIA L. SYDOW* AND RAYMOND P. AHLQUIST, *Dept. of Pharmacology, Univ. of Georgia School of Medicine, Augusta*

The cardiovascular actions of the following compounds were compared to those of adenosine in the anesthetized dog: adenylic acid, adenine, guanine, guanosine, guanylic acid, cytidine, cytidylic acid, thymine, hypoxanthine, uracil, uridine and ribose. Changes in arterial pressure, femoral and carotid arterial blood flow, heart rate and ECG were used as the criteria of activity and the compounds were administered intravenously, intra-arterially or intra-aortically. Adenosine produced a transient fall in arterial pressure due to peripheral vasodilation. No significant changes in heart rate or ECG were found with the doses tested (1×10^{-6} to 1×10^{-3} moles). On a molar basis adenosine was the most active vasodilator. Sodium adenyate produced about the same degree of dilation but its effect was more prolonged. Sodium guanylate was qualitatively similar to sodium adenyate but only one sixth as effective. Guanosine produced either vasodilation or vasoconstriction depending upon the dose employed and the pretreatment of the animal. All of the other compounds were practically inactive.

Reaction mechanism of diamine oxidase (histaminase) HERBERT TABOR, *Natl. Insts. of Health, Bethesda, Md.*

The preparation of a highly purified diamine oxidase from hog kidney (TABOR, *Federation Proc.* 1949) has been modified by the inclusion of an isoelectric precipitation. The oxidation of 1 M of histamine or putrescine by diamine oxidase (in the presence of catalase) requires $\frac{1}{2}$ M oxygen. One M NH_3 appeared, and 1 M bisulfite was bound by the reaction product. During the oxidation of histamine the imidazol ring remained intact. In addition to the bisulfite binding, evidence for an aldehyde intermediate during histamine oxidation was indicated by the intense rose color obtained upon addition of 2,4-dinitrophenylhydrazine to the reaction product and subsequent alkaliniza-

tion Furthermore, additional experiments showed that aldehyde oxidase (prepared according to Racker) oxidized the intermediate as measured by the stoichiometric reduction of diphosphopyridine nucleotide These data indicate that the most likely reaction mechanism, among the different possibilities proposed by various authors, is the conversion of histamine to imidazol acetaldehyde (ZELLER, STEPHENSON, *et al*)

Metabolism of radioactive S³⁵ thiopental (Pentothal) in the rat and monkey J D TAYLOR,* R K RICHARDS AND D L TABERN* *Depts of Pharmacology and Special Research, Abbott Research Labs, North Chicago, Ill*

The urine of rats injected intraperitoneally with a single dose of 40 mg/kg of radioactive Pentothal (6 M conc /gm) was analyzed for chloroform extractable, inorganic and ethereal sulfate, and neutral sulfur over a period of 4 days At the end of 24 hours, 65% of the total injected radioactivity was extracted At the end of 4 days 85% of the total radioactivity could be accounted for with 7% chloroform extractable, 23% as inorganic sulfate, 8% as ethereal sulfate, 40% as neutral sulfur, 5% in the feces, and only 2% remaining in the carcass In the monkey injected intravenously with 35 mg/kg of radioactive Pentothal, 75% of the injected dose was excreted in the urine in the first day A total of 86% of the radioactivity was accounted for in 4 days with 17% occurring as inorganic sulfate and 14% of the total injected dose chloroform extractable Paper chromatography was used to determine the number of radioactive degradation products in the urine The number and relative amounts of these products varied with species and time after injection In one fraction of monkey urine, at least 9 radioactive compounds were found At least 4 of them can be extracted with chloroform One of these latter compounds is unchanged Pentothal and another is probably the Pentothal carboxylic acid described by Brodie *et al* (personal communication)

Some substituted ethylenimines with actions like nitrogen mustards J B THIERSCH* AND F S PHILIPS *Pharmacology Section, Division of Experimental Chemotherapy, Sloan-Kettering Inst for Cancer Research, New York City*

Nitrogen mustards are tertiary amines having 2 or more 2-haloethyl groups/molecule, for example, methyl-*bis* (2-chloroethyl) amine (HN2) and N,N'-*bis* (2-chloroethyl)-piperazine (I) Such compounds act through *in vivo* transformation into ethylenimmonium derivatives Therefore, it was interesting to compare actions of 2,4,6-*tris* (ethylenimino)-s-triazine (II), 1,1'-hexamethylene-*bis* (3,3-ethylenurea) (III), and other substituted ethylenimines with those of HN2 and I

Characteristically nitrogen mustards in near MLD amounts cause a delayed lethal syndrome associated with marked pancytopenia and severe diarrhea Animals become progressively debilitated after poisoning and succumb between 3 and 7 days Atrophy of all hematopoietic tissues, cytological abnormalities in bone marrow, and damage to intestinal epithelium are typically found Substituted ethylenimines like II and III are as toxic as HN2 and I and near MLD amounts cause a similar delayed lethal syndrome with diarrhea and pancytopenia Lesions noted parallel those observed in animals given nitrogen mustards Structural analogs differing from II in lacking ethylenimine groups are much less toxic and do not act like nitrogen mustards Supralethal doses of II like those of HN2 are convulsant and paralytic However, unlike HN2, II is not outstandingly parasympathomimetic This may be related to the tertiary state of the ethylenimine-derivative in contrast to the quaternary state of ethylenimmonium transformation products of HN2

'Benemid' (p-(di-n-propylsulfamyl)-benzoic acid), an anticatabolite its estimation in body fluids ELIZABETH K TILLSON,* GRACE S SCHUCHARDT* ALICE A PITT,* RICHARD W GASS* AND KARL H BEYER *Dept of Pharmacology, Med Research Division, Sharp & Dohme, Inc, Glendolen, Pa*

Beyer *et al* have reported (*Federation Proc* 1950) that 'Benemid' (p-(di-n-propylsulfamyl)-benzoic acid) decreases the destruction and elimination of certain therapeutically useful organic acids by inhibiting their conjugation with glycine In this sense, it functions as an anticatabolite Two analytical methods have been developed for the estimation of the drug in body fluids The first method depends on the fact that the compound can be extracted into chloroform from an acidic, aqueous medium and in turn reextracted from chloroform into 0.1 N sodium hydroxide The alkaline solution is examined spectrophotometrically at a wave length of 242.5 mμ For the second method the drug is also extracted into chloroform from an acidic aqueous medium The chloroform layer is shaken with an aqueous solution of methylene blue The colored salt, formed at the surface, is soluble in the solvent making it possible to determine the amount present by examining the chloroform layer colorimetrically With the aid of these methods, it has been found that the compound is well absorbed following its oral administration, that it is excreted extremely slowly if at all, and that hydrolyzable metabolites of the drug appear slowly in the urine following its oral or parenteral administration

In vivo antihistamine activity of several antihistamines R TISLOW, S MARGOLIN, M T

SPOERLEIN AND E. VOLAGE (introduced by H. B. HAAG) *Biological Research Labs., Schering Corp., Bloomfield, N. J.*

The oral activity and toxicity of several antihistamines were determined in guinea pigs by the method previously described (LaBelle, A. and R. Tislow *Federation Proc.* 7: 236, 1948). To determine the potency, animals were challenged one hour after feeding of the antihistamine by rapid intravenous injection of 11 mg/kg of histamine dihydrochloride. From the data and from clinical experience, it appears that the *in vivo* test in guinea pigs provides a better estimate of the clinical effective dose of antihistamines as compared with the *in vitro* test.

Effects of parpanit, myanesin, and benzimidazole on properties of frog nerve. J. E. P. TOMAN, W. H. EVANS, S. C. HOUSTON, H. V. MILLER, J. M. NANCE AND B. K. WILSON (introduced by L. S. GOODMAN) *Depts. of Physiology and Pharmacology, Univ. of Utah College of Medicine, Salt Lake City.*

The effects of centrally acting muscular relaxants were studied in frog sciatic nerve by means of a battery of tests previously devised for anticonvulsant investigations. By all tests used molar potency was greatest for parpanit and least for benzimidazole, as previously observed for their relaxant and toxic central actions. Concentrations blocking conduction were found to act by raising threshold rather than by depolarizing. Alterations of normal fiber function were noted in the concentration range of central toxic effects *in vivo*. Protection against hyperexcitability induced by excessive stimulation or by phosphate treatment was found in the concentration range for minimal central actions *in vivo*. In spite of the greater potency of parpanit, the margin of safety was least for this drug and greatest for myanesin, in accord with anticonvulsant tests in mammals. Beyond these parallels no distinct patterns of action were noted which might clarify the known clinical differences between these drugs.

Effect of convulsant and anticonvulsant agents on the activity of cytochrome oxidase. CLARA TORDA AND HAROLD G. WOLFF *New York Hospital, Kingsbridge Hospital (V.A.) and Depts. of Medicine, Neurology and Psychiatry, Cornell Univ. Med. College, New York City.*

The effects of convulsant and anticonvulsant agents on the activity of cytochrome oxidase have been investigated. The activity of cytochrome oxidase increased in the presence of the convulsant agents used (acetylcholine, caffeine, dichlorodiphenyltrichloroethane, mechoyl, methylsalicylate, pentamethylene tetrazol, picrotoxin, scilliroside, and strychnine) in concentrations of 1×10^{-3} M and less. The greatest increase ob-

served was over 250%. The activity of cytochrome oxidase was not modified significantly by the anticonvulsant agents used (hydantoin, methylphenyl-ethyl hydantoin, phenylhydantoin sodium, phenobarbital, and tridione) in concentrations of 1×10^{-3} M and less. Since changes in the electrical activity of brain characteristic for seizures precede the increase of cerebral oxygen consumption (Davies, P. W., and A. Remond *Research Publ. A Nerv. & Ment. Dis.* 26: 205, 1947) the increase of the activity of cytochrome oxidase in the presence of the convulsant agents suggests that these agents actively induce not only the seizures and the changes in the electrical activity of the brain but also the increase of oxygen consumption of the brain during the seizures.

Treatment of sodium fluoroacetate (1080) poisoning in dogs. W. W. TOURTELLOTT* AND J. M. COON *Toxicity Lab. and Dept. of Pharmacology, Univ. of Chicago, Chicago, Ill.*

Sodium acetate and ethanol antagonize synergistically 1080 poisoning in mice (*Federation Proc.* 8: 339, 1949). The present report is an attempt to evaluate these compounds and barbiturates in treating 1080 poisoning in dogs. The oral LD-50 of the 1080 powder used in these dog experiments was found to be 0.066 mg/kg. Of 24 dogs poisoned with 0.12 mg/kg of 1080, a surely fatal dose, and treated 30-40 minutes later, none of 6 survived with ethanol-sodium acetate treatment, 6 of 6 survived with pentobarbital-phenobarbital treatment and 12 of 12 survived with ethanol-sodium acetate-barbiturate treatment. Of 13 dogs poisoned with 0.24 mg/kg and treated 30-40 minutes later with ethanol-sodium acetate-barbiturate, 3 dogs survived. The dosage schedule of 50% ethanol and 50% sodium acetate beginning 30-40 minutes after poisoning was 2 cc/kg intravenously and repeated orally at 2 and 5 hours. The dosage schedule of the barbiturates was 15 mg/kg of pentobarbital intravenously 30-40 minutes after poisoning, 25-50 mg/kg of phenobarbital subcutaneously at 3 and/or 9 hours, and 5 mg/kg of pentobarbital p.r.n. for convulsions. The dogs receiving ethanol-sodium acetate required 40% less phenobarbital for prophylaxis against severe convulsions, while approximately the same amount of pentobarbital was given to control convulsions.

Distribution of procaine in squid axons (Loligo).

A. P. TRUANT (introduced by PAUL K. SMITH) *Dept. of Pharmacology, George Washington Univ. School of Medicine, Washington, D. C.*

Recently, the distribution of procaine in sciatic nerves (*Rana pipiens*) has been studied in relation to conduction block (A. P. Truant and E. L. Way, unpublished). The distribution of procaine in the nerve fiber of the giant axon of the squid was

studied The giant nerve fiber was prepared free of adjacent tissue and mounted on electrodes in a moist chamber Normal neurograms of the monophasic action potential were recorded and the axon segment was immersed in buffered artificial sea water, containing procaine hydrochloride When conduction block occurred the treated segment was washed and the axoplasm was extruded The procaine concentrations in both the axoplasm and the axon membrane were determined colorimetrically In 22 experiments the average concentration of procaine at time of conduction block in the axoplasm was $96.7 \mu\text{g}/100 \text{ mg}$ of tissue and that in the axon membrane $9.3 \mu\text{g}/100 \text{ mg}$ of tissue The concentration of procaine in the axoplasm at the time of recovery was $68.9/100 \text{ mg}$ axoplasm while the axon membrane concentration did not significantly change The concentration of procaine in the axoplasm is not the only relevant factor responsible for conduction block In axon segments blocked with 0.01 M procaine and subsequently recovered in sea water the action potential was impeded by carefully blotting the treated segment Control nerves were not affected by this procedure By spraying the axon with sea water conduction returns in 1-2 minutes This phenomena could be repeated until the axoplasm procaine concentration became sub-minimal

Theophylline blood levels after oral, rectal and intravenous administration of Aminophylline
EDWARD B TRUITT, JR AND VICTOR A MCKUSICK (introduced by JOHN C KRANTZ, JR) *Dept of Pharmacology, Univ of Maryland and Cardiovascular Clinic, U S Marine Hospital, Baltimore, Md*

Theophylline blood levels were measured by the method of Truitt, *et al* (*J Pharmacol & Exper Therap* 91 185, 1947) Blood levels were determined in six normal subjects at various intervals up to 8 hours Aminophylline (0.5 gm) was given by intravenous injection and rectal suppository Uncoated tablets of Aminophylline (0.3 gm) were given orally From the data on intravenous administration the average rate of disappearance of theophylline was found to be $0.12 \text{ mg \%}/\text{hour}$ One patient with carbon tetrachloride nephrosis was observed to have a prolonged elevation of

blood level with a slow rate of disappearance The data indicate that rectal administration by suppository gives peak blood levels of only about 20% of the level attained after the same period (2 hr) by intravenous administration of the same dose After oral administration blood levels were more comparable with the intravenous route, 60% as large a dose by mouth resulted in a 2-hour blood level of approximately 65% of the blood level at the same time by the intravenous route

New color reaction for the estimation of steroid ketones having the α, β -unsaturated ketone grouping in ring A ERNEST J UMBERGER (introduced by ARNOLD J LEHMAN) *Division of Pharmacology, Food and Drug Admin Federal Security Agency, Washington, D C*

Feigl's spot test for aldehydes and ketones employing azobenzenephnylhydrazine sulfonic acid (APS) has been developed into a method suitable for the quantitative estimation of testosterone and other steroids having the α, β -unsaturated ketone grouping in Ring A Place 0.5 ml of alcoholic solution of testosterone (about $50 \mu\text{g}$) and 2.0 ml of APS reagent ($0.5 \text{ mg}/\text{ml}$ in diluted H_2SO_4 prepared by mixing 1 volume conc H_2SO_4 with 2 volumes H_2O) in a glass-stoppered flask and let stand in the dark for 30 minutes Add 5.0 ml H_2O and 5.0 ml CCl_4 shake and transfer to a separatory funnel Draw off the CCl_4 layer through a cotton pledget and measure the color at $416 \text{ m}\mu$ Include a blank and a standard with each run for comparison The reaction should be carried out in subdued light to prevent fading If 4.0 ml of the yellow CCl_4 solution is diluted with 1.0 ml of 2.5% HCl in EtOH , a less stable bluish-purple color is obtained which can be utilized by making the readings at $580 \text{ m}\mu$ Of the compounds so far tested, positive reactions are given by testosterone, testosterone propionate, methyl testosterone, ethinyl testosterone, progesterone and desoxycorticosterone acetate The intensity of the colors are inversely proportional to their molecular weights Benzaldehyde and formaldehyde give yellow colors which become reddish-purple and red respectively on making acid Essentially negative reactions are given by 7-ketocholesterol acetate, androsterone, dehydro isoandrosterone, estrone, acetone, ethyl acetoacetate, benzyl styryl ketone, and p-dimethylaminobenzaldehyde

Antagonistic effects of pentamethylene-bis(trimethylammonium iodide) (C5) and of d-tubocurarine (dTC) on action of decamethylene-bis(trimethylammonium bromide) (C10) in man
KLAUS R UNNA AND MAX S SADOVE * *Dept*

TIME	THEOPHYLLINE BLOOD LEVELS mg %/70 kg		
	Intravenous	Oral	Rectal
10 min	1.20		
30 min	1.06	0.18	
1 hr	0.86	0.34	0.04
2 hr	0.73	0.46	0.14
4 hr	0.51	0.39	0.10
8 hr	0.12	0.14	0.06

of Pharmacology, Univ of Illinois, College of Medicine, Chicago, Ill

The curariform action of C10 differs from that of dTC in that it is not antagonized by neostigmine. In animals, both dTC and C5 have been found to counteract the effects of C10. It has been claimed (ORGANE, PATON, AND ZAIMIS *Lancet* 1 21, 1949) that C5 antagonizes the effects of C10 also in man. In 4 volunteers in whom the effects of C10 in doses up to 2 mg on grip strength and vital capacity had been determined repeatedly, pretreatment with 50 mg of C5 five minutes before the administration of C10 failed to alter significantly the response to C10 or to shorten its duration of action. These results are contrasted to the effects of prostigmine on the response to dTC under comparable conditions. In contradistinction, subjects given dTC in doses of 8-10 mg were found after recovery from the paralytic effects—to be remarkably well protected against the curarizing effects of a subsequent injection of C10.

Antagonism of d-tubocurarine by neostigmine methylsulfate E F VAN MAANEN (introduced by G H ACHESON) *Dept of Pharmacology, College of Medicine, Univ of Cincinnati, Ohio*

Adequate doses of neostigmine sometimes decurarine but at other times fail to do so. This can be explained by the relative magnitudes of 1) the increased concentration of acetylcholine resulting from the action of neostigmine and 2) the increased threshold of the receptive substance to acetylcholine produced by d-tubocurarine. Since neostigmine eliminates only the destruction of acetylcholine, it can increase the acetylcholine concentration only to a certain limit. Thus, in the rat sciatic nerve-muscle preparation, varying amounts of neostigmine given intravenously before d-tubocurarine produced no more than a threefold increase in the paralyzing dose of the latter (from 30-80 to 100-220 $\mu\text{g/kg}$ rat). In preparations in which the threshold to acetylcholine can be determined, however, this variable may be increased markedly by increasing the dose of d-tubocurarine. Neostigmine injected intravenously during total paralysis by d-tubocurarine in the cat sciatic nerve-muscle preparation produced either (A) a rapid recovery of muscular contraction or (B) no immediate decurarization but instead, a gradual recovery, like that observed without neostigmine, but occurring sooner. (A) is found when the threshold is only moderately elevated beyond the level of complete paralysis, hence the increase in acetylcholine concentration is immediately effective in overcoming the paralysis. In (B), however, the elevation of threshold is so great that the greatest increase of acetylcholine concentration which can result from neostigmine fails to reach the threshold and is evidenced merely by an earlier recovery from paralysis.

Effect of L-hydrazinophthalazine (C-5968) on cardiovascular system of unanesthetized dogs HARRY A WALKER, SUSANNE WILSON* AND ARTHUR P RICHARDSON *Dept of Pharmacology Emory Univ School of Medicine Emory University Ga*

The effect of 1-hydrazinophthalazine (C-5968) on the response of the cardiovascular system of unanesthetized dogs to the intravenous injections of acetylcholine, pure 1-epinephrine, and pure 1-norepinephrine and to tilting from a horizontal to an 85° upright position has been studied after oral and progressively increasing intravenous doses of the drug. Intravenous doses of 0.25 mg/kg produced a slight decrease (5%) in resting systolic pressure accompanied by a marked increase (50%) in pulse rate. As the dose was increased to 8 mg/kg there was a progressive hypotensive effect with the mean systolic pressure gradually falling from the control level of 124 mm Hg to 90 mm although the mean pulse rate had risen from 93-198 beats/min at the same time. With 0.25 mg/kg there was a postural hypotension upon tilting with a 34% decrease in systolic pressure and a 24% decrease in pulse rate. The only change in the acetylcholine response was a 50% decrease in the reflex tachycardia. This latter effect may be explained by the fact that the resting pulse rate with this dose of C-5968 was already increased. At this same dose the pressor response to intravenous injection of 1-epinephrine and 1-norepinephrine was not materially altered. The homeostatic mechanism of maintaining blood pressure during the tilting procedure apparently is altered by 0.25 mg/kg of C-5968 without marked effects on the compensatory reflexes brought into play by the intravenous injection of acetylcholine and epinephrine. Larger doses of C-5968 depress the epinephrine response. A typical response was an abrupt rise in pressure followed by a gradual decrease which frequently progressed below the resting pressure. The initial pressor response was never completely blocked.

Effect of D- and L-methadone on blood glucose and lactate of dog D T WATTS (introduced by C L GEMMILL) *Dept of Pharmacology, Univ of Virginia Med School, Charlottesville*

Previous experiments have shown that both D- and L-methadone inhibit aerobic oxidative enzymes of brain homogenates but do not inhibit the anaerobic glycolysis of glucose to lactate. The present experiments were undertaken in an attempt to obtain indirect evidence for *in vivo* enzymatic blockage in dogs by demonstrating an increase in intermediate metabolic products such as lactate after the administration of these drugs. Glucose and lactate determinations were made on venous blood drawn at one-hour intervals follow-

ing the intravenous administration of the drugs. The following maximum changes from control levels were obtained

DRUG	DOSE mg/kg	% CHANGE	
		Lac tate	Glu cose
none		-16	-12
D-methadone	3 0	-24	+17
L-methadone	3 0	+60	+60
L-methadone	8 0	-23	+41
L-methadone + Nem- butal	3 0 + 30 0	-31	-7

During control experiments and after D-methadone lactate value dropped slightly. The L-methadone at 30 mg/kg produced a marked increase in lactate which is apparently due to increased excitability and muscular activity rather than enzymatic blockage. When deep depression and muscular relaxation was produced by a higher concentration of L-methadone or by methadone plus nembital the lactate level dropped well below the control value. The D-methadone produced a slight hyperglycemia. The L-methadone produced a marked hyperglycemia. This hyperglycemia was eliminated by nembital, indicating it is probably due to a central nervous system stimulation.

Effects of tetra-ethyl thiuramdisulfide (antabuse) on toxicity of methyl alcohol E. LEONG WAY AND RUSSELL HAUSMAN * *Division of Pharmacology and Experimental Therapeutics, Univ of California School of Medicine, and College of Pharmacy, San Francisco*

The effects of antabuse on the oral toxicity of methanol was investigated experimentally on rats and rabbits. The preliminary results indicate that antabuse increases the toxicity of methyl alcohol but not to the extent that it potentiates the effects of ethyl alcohol. In animals which were given a single dose of antabuse in aqueous suspension daily for 3 days and then methanol, the toxic symptoms arising had a more rapid onset and appeared to be more protracted and severe than in the control animals which received methanol, only or an aqueous suspension of calcium carbonate instead of antabuse prior to the methyl alcohol. The median lethal dose (LD_{50}) of methanol was significantly decreased by antabuse. Death usually occurred earlier in the antabuse animals and the recovery of the survivors was considerably slower than in the control group.

Pitfalls in the treatment of frostbite with heparin

DAVID WEINER AND KURT LANGE (introduced

by M. G. MULINOS) *Dept of Medicine, New York Med College, New York City*

In our original communication in 1945 and in later reports we have demonstrated the efficacy of heparinization in preventing gangrene subsequent to experimental frostbite. Several investigators have attempted to produce similar results, some have encountered success, some failure. Careful analysis of the reports of those who have failed indicates that the failure to prevent gangrene in a large percentage of treated animals is due to inadequate heparinization either in degree or in duration. This is demonstrated by the following findings. One hind leg of each of 83 rabbits was immersed in an alcohol dry ice bath at -12°C to -30°C for 30 to 45 minutes under penthotal sodium anesthesia. Thirty-two were not heparinized. Thirty-four were adequately heparinized for at least 5 days with the coagulation time consistently above 30 minutes (Lee-White method). Seventeen were inadequately heparinized. Of the 32 controls, all (100%) resulted in complete gangrene of the exposed limbs. Of the 17 inadequately heparinized animals, 13 (76%) resulted in either partial or complete gangrene. Of the 34 adequately heparinized animals, 5 (15%) resulted in gangrene. These findings emphasize the importance of maintaining the coagulation time above 30 minutes throughout the treatment period which should be at least 5 to 6 days. The dosage necessary to accomplish this varies widely in individual animals and in different strains necessitating frequent determinations of the coagulation by the Lee-White method.

Effect of anoxia on activity of isolated intestine T. C. WEST,* G. HADDEN* AND A. FARAH *Dept of Pharmacology, University of Washington School of Medicine, Seattle*

The effect of anoxia on contractions of the isolated rabbit intestine was studied with respect to 1) substrate utilization, 2) drug influence and 3) action of enzyme inhibitors. Anoxic influence on substrate utilization and enzyme inhibitor action was measured by alteration in the character of spontaneous contractions and in the acetylcholine response. Anoxic anoxia and sodium cyanide were used to test the effect on various drugs influencing smooth muscle contraction. The substrates glucose, mannose, lactate, pyruvate, acetate, oxalacetate, butyrate, caproate, caprylate and acetoacetate furnish energy for aerobic contractions. Anaerobic contractions occurred only in the presence of glucose or mannose. Acetylcholine, pilocarpine, nicotine and barium chloride produced anaerobic contractions. Eserine and hexaethyltetraphosphate (HETP) were incapable of stimulating the anoxic gut. The anoxic atropine effect was characteristic to that seen aerobically.

The anaerobic nicotine contraction was sensitive to block by d-tubocurarine chloride and tetraethylammonium bromide. Epinephrine was inhibitory to anaerobic spontaneous contractions. Dinitrophenol and iodoacetate completely inhibited all anaerobic activity. Sodium fluoroacetate, malonic and propionic acids were ineffective anaerobically. In high concentration, the cyanide effect resembled that of anoxic anoxia. Low concentrations of cyanide inhibited tonus without greatly affecting spontaneous contractions, and abolished the activity of eserine and HETP. Acetylcholine and pilocarpine produced contractions but the characteristic tonus change was abolished.

Effect of certain dialkyl-substituted aminoalkyl-bearing compounds on apomorphine-induced emesis. JOSEPH M. WHITE,* DANIEL FREEDMAN*, E. L. MCCAWLEY AND WILLIAM D. GRAY*
Dept. of Pharmacology, Yale Univ. School of Medicine, New Haven, Conn.

Diphenhydramine 8-chlorotheophyllinate (Dramamine) has been introduced into therapy for the control of motion sickness. Diphenhydramine (Benadryl) is but one of a number of common substances which (1) contain a substituted aminoalkyl side chain (2) exhibit antihistaminic activity. Apomorphine hydrochloride 30 mg/kg when administered subcutaneously was found consistently to produce emesis in the dog. When 2 mg/kg of the 8-chlorotheophyllinate salt of diphenhydramine were administered orally to dogs, the effect of apomorphine upon the vomiting center was antagonized completely. Similarly 1 mg/kg of diphenhydramine (as the hydrochloride) prevented emesis. No protection could be elicited when 10 mg/kg of 8-chlorotheophylline were administered. This pharmacological antagonism suggests that diphenhydramine acts by depression of the vomiting center. Protection against apomorphine-induced emesis in the dog may be used as a criterion for the screening of compounds which have an action similar to that of diphenhydramine. Relative potency may also be determined. A series of compounds related structurally and/or pharmacologically to diphenhydramine has been studied.

Toxicity studies on tomatine. ROBERT H. WILSON, GEORGE W. POLEY* AND FLOYD DEEDS*
Pharmacology Division, Bureau of Agricultural and Industrial Chemistry, Agricultural Research Admin. U. S. Dept. of Agriculture, Albany, Calif.
Tomatine is an antifungal substance discovered in wilt-resistant tomato plants by Fontaine, Irving, *et al.* (*Arch. Biochem.* 18: 467, 1948). Such a material might be useful as an addition to foods to prevent mold-growth and as a treatment of fungus diseases. Studies on chronic, subacute, acute oral

toxicities and intravenous toxicity are presented. Rats were fed diets containing up to 0.04% of tomatine or its aglycone, tomatidine for 200 days. This concentration is considered well above any amount needed in food preservation. Growth, food intake and appearance of the animals were normal. Tissues at autopsy showed no abnormalities in gross appearance or in weight, histological examination is in progress. Subacute toxicity was studied in rats fed 250 mg tomatine/kg by stomach tube daily for 5 days. No symptoms were noted, autopsy 3 days after the last administration showed grossly normal tissues. Three rats received single oral doses of 800-1000 mg tomatine/kg. Death occurred within 2 days with apparent contracture of the pylorus and, in two, gross infarction in the liver. Preliminary studies indicate that intravenous administration of a few mg of tomatine/kg to mice causes death within seconds. Blood pressure tracings from rats receiving 1-2 mg tomatine/kg i.v. showed a marked drop in pressure, frequently precipitous. Recovery might be rapid or the pressure might remain depressed for some time. Central action was shown by the absence of blood pressure change or a slight rise, after vagal section or atropinization.

Studies on the nervous and humoral control of coronary circulation. MARTIN M. WINBURY*, PATRICIA M. MICHIELS* AND D. M. GREEN*
Pharmacology Dept. Division of Biological Research, G. D. Searle & Co., Chicago, Ill.

The effects of various chemical mediators, drugs and nerve stimulation on the coronary blood inflow (CBF) were investigated in open-chest anesthetized dogs. CBF was recorded continuously with a rotameter. All injections were made into the coronary circuit. CBF was increased by the chemical mediators epinephrine (2 γ), 1-arterenol (2 γ) and acetylcholine (10 γ) and by histamine (15 γ). Pitressin (0.025 units) reduced CBF. These effects were not accompanied by significant changes in blood pressure or cardiac output. The effect of acetylcholine on CBF was blocked by atropine, that of epinephrine and arterenol by Compound 883 F. Apparently the chemical mediators do not effect CBF by a common mechanism. Reduction in CBF by cardiac vagus stimulation was always associated with hypotension and bradycardia. Increase in CBF by cardiac sympathetic nerve stimulation, pre- or post-ganglionic was not always associated with tachycardia and hypertension. Gastric dilatation (> 40 mm Hg) reduced CBF but was associated with simultaneous reduction in blood pressure and cardiac output. These effects were duplicated by a reduction in venous return and were not blocked by atropine. Stimulation of typical somatic motor and sensory nerves did not effect CBF.

Inhibition of the pasteur effect in brain by certain steroids ALBERT WOLLENBERGER (introduced by OTTO KRAYER) *Dept of Pharmacology, Harvard Med School, Boston, Mass*

The metabolism of brain tissue is profoundly altered by low concentrations ($4 \times 10^{-7} - 10^{-5}$ M) of certain steroids which possess the property of producing CNS disturbances and of strengthening the contractile power of failing heart muscle, viz the tertiary amine bases among the ester alkaloids of veratrum (protoveratrine and veratridine) and the cardiac glycosides. In slices of guinea pig cerebral cortex incubated in Krebs-Ringer - glucose - phosphate solution these compounds produce a 30-100% stimulation of the respiration, which in the case of the veratrum alkaloids may last for several hours, raise the aerobic glycolysis to the normal anaerobic level, and cause inhibition up to 100% of the anaerobic glycolysis. The R Q remains unity. These changes strongly resemble the effect of high concentrations of extracellular potassium ions described first by Ashford and Dixon. The inhibitory effect of the steroids on the Pasteur reaction is restricted, like that of potassium, to central nervous tissue. It does not seem to be associated, at least in veratrum-treated brain cortex, with leakage of intracellular potassium ions into the medium. Omission of potassium ions from the medium gives rise to strong aerobic glycolysis which is not enhanced further by the steroids. In contrast to the potassium effect, the steroid effect is not reversed by washing. However, the depression of the anaerobic glycolysis is largely prevented, though not reversed, by nicotinamide (0.04 M) and, to a lesser extent, by pyruvate (0.0017 M) while ATP and DPN are ineffective. Observations on phosphate uptake by respiring brain homogenates provide no evidence that the steroids uncouple oxidation and phosphorylation or otherwise make available inorganic phosphate. The protective action of nicotinamide suggests stimulation of DPN-ase and it is conceivable that release of ordinarily restrained enzyme activity in the cell represents a more general effect of the tertiary veratrum amines and the cardiac glycosides.

Fate of mescaline in serum, plasma and blood

L. A. WOODS, J. COCHIN* AND M. H. SEEVERS
Dept. of Pharmacology, Univ of Michigan, Ann Arbor

Using a specific and sensitive colorimetric method, the details of which will be published elsewhere, it was found that mescaline is not altered chemically when exposed to dog or human plasma for 24 hours at temperatures between 5° and 25°C. However, when serum, plasma, or whole blood is incubated with mescaline at 38°C for

3-4 hours, a considerable loss of the drug occurs. This loss of mescaline may be due to a chemical reaction with carbon dioxide and/or enzymatic alteration. The former is a definite possibility since it is known that primary beta-phenylethylamines, such as mescaline, exhibit a marked affinity for carbon dioxide resulting probably in the formation of carbamates of the type, $RCH_2CH_2NHCOOH \cdot NH_2CH_2CH_2R$. The effect of carbon dioxide on this phenomenon was ascertained by determining the comparative rates of disappearance of mescaline from a buffered solution equilibrated in air and in 100% carbon dioxide. In each instance the drug was dissolved in 0.25 M Sorensens phosphate buffer at pH 7.4 and incubated with shaking for 4 hours at 38°C. In the presence of pure carbon dioxide, 50-65% of mescaline was lost whereas none disappeared in the presence of air. The 'lost' mescaline was recovered quantitatively after reconversion by heating with basic solution. Although enzymatic breakdown is a possibility, heating of serum at 58°C for 1 hour did not modify its capacity to degrade mescaline when incubated with this substance at 38°C.

Veratrine-like properties of the alkaloidal fractions from *Zygadenus venenosus* SUMNER YAFFE AND S. MORRIS KUPCHAN (introduced by OTTO KRAYER) *Dept of Pharmacology, Harvard Med School, Boston and Dept of Chemistry, Harvard Univ Cambridge, Mass*

Since Reid Hunt's discovery (*Am J Physiol* 6: vii, 1902) of a veratrine-like activity of the alkaloids obtained from various species of *Zygadenus*, relatively little has been done to identify the active principles, although Heyl *et al* (*J Am Chem Soc* 35: 258, 1913, 71: 1751, 1949) succeeded in isolating a crystalline alkalamine, zygadenine, as early as 1913, which is considered to be a tertiary amine base like cevine. We have undertaken to study the alkaloids of *Zygadenus* chemically and pharmacologically in view of the increased interest in the veratrum alkaloids and substances related to them. The alkaloidal fractions so far isolated caused the characteristic myotonic response when tested on the isolated sartorius muscle of the frog. In addition small amounts of some of the alkaloidal fractions produced a reflex decrease in blood pressure and heart rate and a stoppage of respiration which were mediated by the vagus nerves, as they could be abolished or prevented by interruption of the conduction of the vagus nerves. It is probable, therefore, that *Zygadenus venenosus* not only contains tertiary amines of the type of zygadenine but also ester alkaloids of such tertiary bases.

THE AMERICAN SOCIETY FOR EXPERIMENTAL PATHOLOGY

Thirty-fifth Annual Meeting

ATLANTIC CITY, NEW JERSEY, APRIL 17-21, 1950

(An asterisk * following an author's name indicates "by invitation")

Ketoglutaric acid oxidase an assay procedure

W WILBUR ACKERMANN (introduced by THOMAS FRANCIS, JR.) *Dept of Epidemiology and Virus Laboratory, Univ of Michigan, School of Public Health, Ann Arbor*

An assay procedure was designed specifically for comparing the α -ketoglutaric acid oxidase activity of tissues. A high degree of cell disruption was accomplished by homogenization in isotonic potassium chloride. This resulted in a dilution of the cell contents and inactivation of all the enzymes of the Krebs cycle. The α -ketoglutaric acid oxidase was found to be reactivated by supplementing the homogenate with phosphate and magnesium ions, adenosinetriphosphate, cytochrome C, α -ketoglutaric acid, co-carboxylase, and diphosphopyridinenucleotide. The further oxidation of succinate, the product of the reaction, was prevented by the use of malonate. The rate of the reaction was determined by the oxygen uptake. In this manner it is possible to oxidize α -ketoglutaric acid in a preparation of the whole tissue at which is believed to be the maximum rate. The assay was applied to a survey of various tissues of the mouse. The activities of these tissues were found to vary in the following decreasing order: heart, kidney, liver, brain, spleen, and lung.

Comparison of physico-chemical properties of

isolated skeletal and cardiac myofibrils CHARLES A ASHLEY,* GEORGE M HASS* AND ARMIN SCHICK * *Rush Lab of Pathology, Presbyterian Hospital, in affiliation with Univ of Illinois College of Medicine, Chicago*

Small blocks of skeletal and cardiac muscle were resected from rabbits immediately after death. The muscle was frozen at once with carbon dioxide and cut into thin sections with a freezing microtome. Frozen sections were placed in a solution (0.005%) of crystalline trypsin for about one hour at 0° C. Initial separation of myofibrils from other cellular structure occurred after brief mechanical agitation. Final separation of myofibrils from other constituents of muscle was obtained by differential centrifugation. The final product consisted of large numbers of individual myofibrils. Myofibrils of cardiac and skeletal

origin possessed very similar physico-chemical properties. They contracted irreversibly into small spherical masses in the presence of ATP when the concentration of ATP was greater than 0.0001 molar. The rate of contraction was greatly prolonged by reduction of temperature from 37° C to 0° C and by changes in pH. Fibrils were rendered non-contractile at pH 4 but retained the property of contractility within the range of insolubility of fibrils in phosphate buffer solutions (pH 5–pH 8) of appropriate ionic strength. Solubility of fibrils within near physiological ranges of pH was a function principally of ionic strength and ionic composition of the buffer solutions. At pH 7 in either potassium or sodium phosphate buffer solutions, fibrils were insoluble at intermediate ionic strengths but promptly dissolved at low (0.05 μ) and high (0.5 μ) ionic strengths. The spherical masses resulting from the action of ATP were insoluble in phosphate buffers of pH 7 in the range of ionic strength used (0.005 μ to 0.7 μ).

Experimental study of the virus host cell relationship in fowl pox F B BANG AND G O GEY *

Johns Hopkins Hospital, Baltimore, Md

The growth of the virus of fowl pox in roller tube cultures of chick fibroblasts, epithelium and macrophages has been studied in continuous homologous culture and in some heterologous cells. The virus may be recovered from chick fibroblasts as long as 100 days after inoculation. Any multiplication which takes place under these conditions is unaccompanied by the formation of the classical inclusion bodies. Epithelium derived from lung, cornea and skin was destroyed by the virus and yielded higher titers than the fibroblasts. No large inclusions like those seen overwhelming the epithelium of the chick chorio-allantoic membrane were seen even when the epithelium was set up in slide preparations. It is known, however, from previous work on the development of the inclusions of lymphopathia in roller tube cultures that cells may develop and maintain huge inclusions in such roller tube cultures. Electron microscope sections of the classical fowl pox inclusions show a basic fibrous

structure presumably holding the virus elementary bodies together, thus explaining the rigid nature of these inclusions

Protein loss by complete drainage of intestinal lymph J L BOLLMAN AND E V FLOCK *Division of Experimental Medicine, Mayo Clinic, Rochester, Minn*

Rats cannulated with plastic tubing so that the intestinal lymph is drained externally secrete intestinal lymph equivalent to about one eighth of their body weight daily. The protein lost in this lymph has a higher albumin globulin ratio than plasma, but most of the proteins are plasma proteins in the lymph. The daily loss of protein is about twice that of the total circulating protein (plasma volume \times plasma protein concentration). After this loss is continued 3 or 4 days the plasma protein concentration is reduced about 20% and the plasma volume is also reduced so that the total circulating plasma protein is reduced about 25% in this time. These observations indicate the rapidity with which plasma protein is replaced and also that the intestine (via intestinal lymph) is not a major factor in the formation of plasma protein. Previous studies of intestinal lymph, however, indicated that a specific protein alkaline phosphatase is added to the plasma specifically by the intestinal lymph.

Interrelations between adrenal cortex and lymphoid tissues: growth of adrenal transplants in spleen and thymus with local thymic atrophy EDWARD J BONZE* AND NATHAN B FRIEDMAN *Division of Lab, Cedars of Lebanon Hospital, Los Angeles, Calif*

After bilateral adrenalectomy transplanted fragments of adrenal cortex grew well in both the thymus and spleen of rats. Approximately half of 50 animals survived beyond the 10-day postoperative period. Ninety-five per cent of 20 animals in which a 2-stage bilateral adrenalectomy or unilateral adrenalectomy with transplantation was performed survived. A semblance of normal zonation was established by the regrowth and large sinusoidal blood vessels formed at the periphery. Although no obvious lysis of lymphocytes was noted in either spleen or thymus, the thymic lobules in intimate relation to the proliferating adrenocortical tissue underwent depletion of lymphocytes and extreme atrophy. Peculiar epitheloid cells appeared in the collapsed thymic reticulum. The results suggest that the agent produced by adrenocortical tissue which affects the thymus is probably bound or converted in some way during the course of its activity.

Influence of age on uptake of radioactive phosphate by skeleton of the rat JOHN F BONNER

(introduced by ERIC L ALLING) *Dept of Radiation Biology, Univ of Rochester, School of Medicine and Dentistry, Rochester, N Y*

Radioactive phosphate was administered to rats of 5 age groups from 15 to 170 days. The uptake of labeled phosphate by femur, vertebrae, and skull was determined. The uptake of P^{32} was approximately 5 times as great for the youngest animals (15 days) as for the oldest (170 days). No direct correlation could be obtained with age, weight or the rate of growth of the inorganic portion of bone. Excretion of the radiophosphate was found to have an inverse relation to the bone activity. The highest excretion rate was observed with recently weaned rats.

Use of rat-repletion method for evaluation of amino acid solutions and protein hydrolysates

P R CANNON, L E FRAZIER* AND R HUGHES* *Dept of Pathology, Univ of Chicago, Chicago, Ill*

Data are presented which further demonstrate the usefulness of the rat-repletion method for the evaluation of amino acid solutions and protein hydrolysates. Amino acid solutions or protein hydrolysates were fed in drinking fountains in 5% solutions, designed to yield approximately 200 mg of dietary nitrogen/rat/day. The basal diet supplied 40 non-protein calories/day plus vitamins, salts and roughage. Whenever the fluid component contained an inadequate amount of one or more indispensable amino acids the rats stopped drinking the greater part of the solution, and soon their consumption of the basal ration also diminished. A protein hydrolysate which engendered only fair tissue repletion was markedly improved by the addition to it of a mixture of essential amino acids or by concentration to 70% of original volume. In other words, concentration of ill-smelling constituents did not interfere with its acceptance, but on the contrary improved its utilization. Data are also presented concerning the effects of autoclaving of protein hydrolysates or amino acid solutions in the presence of glucose in relation to amino acid utilization and the Maillard reaction.

Preparation of Ac-globulin free plasma assay of Ac-globulin JOHN R CARTER* AND E D WARNER *Dept of Pathology, State Univ of Iowa, Iowa City*

A method has been devised whereby plasma can be rendered free of Ac-globulin, antithrombin, fibrinogen, and thrombin. The product contains 50-100 units of highly reactive prothrombin. The procedure consists of treating fresh oxalated beef plasma, previously frozen and thawed, with 17 gm/100 cc of kaolin. The kaolin-plasma is then frozen 24 hours, thawed, and centrifuged. The supernatant is treated with equal volumes of

1.5% bichloride of mercury, and insoluble, coagulated egg albumin added. The mixture is then centrifuged, and the supernatant defibrinated, filtered, and stored at -40°C . The amount of Ac-globulin in any given plasma is manifested as a function of 3 variables: 1) the time when conversion begins, 2) the rate of conversion, and 3) the thrombin yield. The quantitative measure of Ac-globulin, which includes the variables, can be represented by an area which is circumscribed by the activation curve and by straight lines through a constant, arbitrarily selected point on each axis. This area can be determined by one of the quadrature methods or with a planimeter, and the amount of Ac-globulin of an unknown can be compared with that of the normal control.

Effect of adrenalectomy and glutathione on x-ray-induced mortality in mice E. P. CRONKITE AND W. H. CHAPMAN *Naval Med Research Inst Bethesda, Md*

The 28-day mortality of mice simultaneously exposed to various doses of 20 mev x-ray was studied on 3 groups of the same age and sex. Group 1 adrenalectomized 10-15 days before exposure and maintained on 1% saline, Group 2 normal control mice, Group 3 injected subcutaneously with glutathione 4 mg/gm immediately before exposure. It is of interest that adrenalectomy 10 days before reduces the total body and hepatic reduced glutathione concentration significantly. The present data indicate that adrenalectomy increases the sensitivity of mice to radiation, this may be related to sulfhydryl levels of tissue. In addition this data refute in part the statement of Straube *et al* (*Proc Soc Exper Biol and Med* 71:539, 1949) "the radiosensitivity of intact or adrenalectomized mice, with or without exogenous adrenal cortical steroids, is similar."

Estimated Percentage Lethal Doses in r from Mortality Dose Curve

	ADRENALECTOMIZED	CONTROL	GLUTATHIONE TREATED
LD ₀	<450	550	550
LD ₅₀	<620	730	840
LD ₁₀₀	<790	940	>1050

Hyperplasia of lymphoid tissues following implantation of cancer cells in resistant hosts JOHN T. ELLIS,* HELENE WALLACE TOOLAN* AND JOHN G. KIDD *Dept of Pathology, New York Hospital—Cornell Med Center, New York City*

The cells of C3H mammary carcinomas and C3H lymphosarcomas regularly proliferate briefly and then regress when implanted subcutaneously in racially-resistant A mice (*Federation Proc* 8:360, 373, 1949). A few days after the tumor cells

are implanted the lymph nodes of the resistant hosts become markedly hyperplastic and exhibit an increase in size and number of the germinal centers (which contain numerous cells in mitosis) and a great thickening of the medullary cords owing to the proliferation in them of elements that seem to be young plasma cells, which later mature. The hyperplasia recedes a short time after the growths regress. The same type of hyperplasia develops even more promptly following implantation of the C3H cancer cells in A mice already immune to them. Furthermore it develops not infrequently after implantation of C3H cancer cells in C3H mice, and it often persists in these hosts as the cancer cells proliferate progressively. The relations of the lymphoid hyperplasia and the resistant state are considered.

Ameboid movement of neoplastic cells H. T. ENTERLINE* AND DALE REX COMAN *Dept of Pathology, Univ of Pennsylvania School of Medicine, Philadelphia*

In previous papers we have attributed the invasive propensities of malignant tumors to ameboid movement of neoplastic cells, which have become detached by loss of their mutual adhesiveness. Although ameboid movement of cancer cells in tissue culture has been described by us and by others, no study has been directed toward determining whether neoplastic cells in general, and especially those of epithelial origin, are capable of ameboid activity. In the present study cinematographic observations were made on a variety of cells in tissue culture. The sources of cells included a variety of human tumors (breast cancer, carcinoma of the kidney, and sarcomas), and 3 animal tumors (Mouse fibrosarcoma 241, Walker rat carcinoma 256, and V₂ carcinoma of rabbits). It was found that the neoplastic cells from all of these tumors displayed active ameboid movement. It was further found that even non-neoplastic glandular epithelial cells (from the human breast) are ameboid, once they become detached from other cells. Of further interest was the observation that even small clusters of from 3-5 cells are able at times to move as a unit. The rates of movement of the cells studied varied from fractions of μ/min to $6\mu/\text{min}$, averaging 1-2 μ/min . Movement was intermittent and no significant differences in rate of movement were found between cells from different tumors.

Influence of steroid hormones on fatty livers EMANUEL FARBER,* DIETER KOCH-WESER* AND HANS POPPER *Hektoen Inst for Med Research and Depts of Pathology, Cook County Hospital and Northwestern Univ Med School, Chicago, Ill*

To elucidate the influence of hormones upon the

development of fatty livers, endocrinological factors in rats intoxicated with ethionine were varied. This analogue of methionine produces a marked fat accumulation in the liver without necrosis or other functional impairment. The fat content of the livers was determined chemically and histologically. Excess fat accumulation was observed by either method only in female but not in male rats. Ovariectomy did not prevent the fatty infiltration, while testosterone administration did. Orchidectomy made the male animals susceptible. Administration of testosterone protected the castrated males. Adrenalectomy prevented fatty livers in female. This suggests the role of testosterone in the prevention of some types of fatty livers.

Histochemical studies on the skeleton in experimental scurvy RICHARD H. FOLLIS, JR. *Dept of Pathology, Johns Hopkins Univ., Baltimore, Md.*

A series of histochemical reactions (*Bull. Johns Hopkins Hosp.* 85:281, 1949) have been carried out on the bones of young guinea pigs placed on a scorbutogenic diet. Some animals were allowed to die of the deficiency, others were treated in time to allow survival in order to study healing sequences. In absolute scorbutus, cytochrome oxidase activity, as qualitatively estimated by the *nad*₁ reaction, is reduced or absent in the cells which make up the *gerustmark*. Alkaline phosphatase activity is completely absent in these cells. In 24-48 hours after treatment intense activity is found in both nuclei and fibers which are being laid down. Similar absence and return is found in the periosteum, as well. The argyrophilic fibers which appear after therapy is instituted are strongly metachromatic.

Comparison of protein and electrolyte changes in tissues during shock from burns and tourniquet trauma CHARLES L. FOX, JR. (introduced by A. R. DOCHETZ) *Dept. of Bacteriology, Columbia Univ. College of Physicians and Surgeons, New York City*

A loss of plasma proteins into injured tissues has been postulated on the basis of the finding of nitrogen in amounts comparable to plasma in the supernatant fluid obtained by centrifuging edematous traumatized tissues. To test whether plasma proteins actually do accumulate in tissues injured by burns or tourniquet trauma, the following experiments were performed. Single hind legs of mice were subjected to the above injuries. When swelling of the injured leg was maximal and shock profound, both hind legs were amputated at the groin and the entire leg analyzed for water, nitrogen, potassium and sodium. Injured legs did not contain more nitrogen than contralateral

uninjured legs although they were 25-75% heavier. If the fluid gained by the edematous injured legs were chiefly plasma, approximately 10-20% (3-8 mg) more nitrogen might be expected in the injured leg. The gain in sodium exceeded the proportionate gain in fluid by 40%, furthermore, the potassium content of these injured legs decreased by an approximately equimolar amount. These data are not in accordance with the view that plasma accumulates in traumatized tissues. They indicate that tissue cells were damaged and exchanged some of their potassium for sodium and that protein-free sodium containing fluid accumulated. Nitrogen previously observed in the supernatant fluid may have been derived chiefly from damaged tissue cells and not from the plasma as assumed.

Fate of transplanted embryonic gonadal tissue into hosts of inbred mouse strains ALFRED GOLDEN *Dept. of Pathology, Veterans Administration Hospital, Buffalo, N. Y.*

Gonadal tissue from about 12-15 day old mouse embryos implanted in the testes of hosts of either of 2 highly inbred mouse strains survived in about $\frac{1}{3}$ of the animals for periods up to 8 months. Of the survivals 25% underwent neoplastic change spontaneously producing small, non-invasive, non-metastasizing multilocular tumors. When methylcholanthrene impregnated wool fibers were implanted in the spleen shortly before or after the transplantation of embryonic gonadal tissue, the ensuing tumors were invasive, but non-metastasizing adenocarcinomas. In these mouse strains methylcholanthrene deposition in the spleen alone produced bulky non-metastasizing fibrosarcomas.

Studies on utilization of antihemophilic factor during clotting JOHN B. GRAHAM,* GEORGE D. PENICK* AND K. M. BRINKHOUS *Dept. of Pathology, Univ. of North Carolina, Chapel Hill*

Transfusion experiments in canine hemophilia, reported last year, showed that normal serum had lost its antihemophilic effect (*Federation Proc.* 8:356, 1949, *J. Exper. Med.* 90:97, 1949). In the present paper studies of the rate of disappearance of the antihemophilic factor (AHF) in clotting dog blood are reported. The method of determining antihemophilic activity consisted of adding standard dilutions of normal plasma or serum samples to freshly drawn whole hemophilic blood. After standing for 30 minutes at 28° C, pH 7.3, residual prothrombin content of the mixtures was determined by the 2-stage method. Free thromboplastin, in contrast to AHF, was determined on each sample by testing the effect on platelet-poor hemophilic plasma. The results indicate that normally AHF is rapidly consumed during and after clotting. Assays of normal sera, 1-3 hours

old, showed only traces of AHF. The rates of disappearance of AHF and of prothrombin during clotting tended to be the same. Ionic calcium, wettable surface and platelets appear to be necessary for a normal rate of utilization of AHF. Plasma allowed to clot in siliconed glassware showed no loss of AHF during the observation period. In plasmas with low platelet levels, AHF disappeared slowly. In citrated plasma freed of fibrinogen by heat coagulation, full antihemophilic activity was present, but on recalcification it rapidly disappeared.

A study of choline deficiency in the rhesus monkey LOUIS D. GREENBERG* AND JAMES F. RINEHART
Div of Pathology, Univ of California School of Medicine, San Francisco

Two rhesus monkeys weighing 2.5 kg, were kept on a modified M-3 diet without choline for 5 months. Because of the presence of sufficient choline precursors (methionine) in the casein of the basal diet, the animals showed no manifestations of choline deficiency at the end of this period and thrived as well as a control animal which was receiving the same diet supplemented with 100 mg of choline citrate daily. For this reason, the casein of the diet was replaced by an equivalent quantity of alpha-protein of soy beans. Within approximately one week after this change the monkeys began to lose weight and have continued to do so. This was followed in 6-8 weeks by the excretion of watery stools, a condition which has persisted to this day. A control animal receiving the same diet supplemented with choline and methionine has gained weight steadily and has remained strong and vigorous. The free and total plasma choline of these monkeys has been followed by microbiological assay during the course of this experiment with the following results. There was no significant alteration in free and total choline of the monkeys on the diet lacking choline while they were receiving casein in the diet. However, the replacement of casein by alpha-protein resulted in a marked decline in the free choline and a significant decrease in the total choline of the plasma.

Effect of penicillin and chloromycetin on oxygen uptake of typhus-infected embryonate eggs DONALD GREIFF* AND HENRY PINKERTON
Depts of Biology and Pathology, St. Louis Univ, St. Louis, Mo

The effect of the injection of 5 mg chloromycetin and 2000 units penicillin G on the oxygen uptake of murine typhus infected embryonate eggs was measured by the technique reported by Greiff and Pinkerton (*J Exper Med* 87:175, 1948). The results obtained are given in the following table.

AGE OF EMBRYOS (DAYS)	UNINJ CONTROLS CC O ₂ /EGG/HR	CHLOROMYCETIN + RICKETTSIAE CC. O ₂ /EGG/HR	PENICILLIN + RICKETTSIAE CC O ₂ /EGG/HR.
5	39	36	45
6		Rickettsiae inoculated	
7	1 33	1 29	1 20
8		Chloromycetin and penicillin-inj	
9	1 68	1 42	2 75 ¹
11	3 08	4 12	5 68 ¹
13	6 32	6 95	7 84 ¹
14	8 50	8 77	10 48 ¹
15	9 93	10 55	11 86 ¹
16	12 30	11 12	10 37
18	17 40	12 90	11 82

¹ Significant increase

The increase in oxygen consumption of the penicillin-injected eggs, as compared with the controls and the lack of such increase in eggs receiving chloromycetin suggest that the rickettsiostatic action of these 2 antibiotics is brought about by different mechanisms. The results are compared with those previously obtained with para-aminobenzoic acid and other reagents.

Immunologic approach to study of treatment of transmitted leukemia in Ak mice P. F. HAHN, E. L. CAROTHERS,* LOUIS BERNARD* AND MARVIN JACKSON *
Meharry Med College, Nashville, Tenn

The Ak strain of mice developed by Furth when inoculated with a spleen brei obtained from mice suffering from leukemia will quite uniformly result in the death of the inoculated animals in a period of from 9-13 days. The Ak strain of mice have been used in this laboratory to study the effect of gold¹⁹³ on the course of such leukemia as well as for the study of various chemotherapeutic agents. Usually, the increased survival time (from 3-10 or more additional days in comparison to the survival time of the average control group) is used to determine the efficacy of the agent employed. In preliminary experiments in which guinea pigs were sensitized by repeated injections of leukemia mouse spleen brei with subsequent treatment of inoculated mice with a serum from such sensitized guinea pigs, it was found that there were very prolonged increases in survival in a few of the mice so treated. In those survivals killed for histological study no evidence of leukemic infiltration was found. Of 70 mice treated with such serum, 5 lived for protracted periods. Only 1 control animal of 289 inoculated survived more than 20 days. That these results can be attributed to chance is felt to have a probability of about 1%. The mice used in these experi-

ments were obtained either from the Sloan-Kettering Institute or Carworth Farms

Experimental cardiovascular disease in monkeys and rabbits TOM R. HAMILTON,* HARRY E. DASCOMB* AND JEROME T. SYVERTON *Dept of Bacteriology and Immunology, Univ of Minnesota, Minneapolis, and Dept of Microbiology, Louisiana State Univ School of Medicine, New Orleans*

In an attempt to learn the reactivity of the cardiovascular system to the constituents of the streptococcus, normal animals and animals with an altered tissue reactivity brought about by hypersensitization with a foreign protein were injected repeatedly with hemolytic streptococci of Group A which had been inactivated *in vitro* by penicillin. Rabbits and monkeys were employed as the host animals. It was learned that streptococci alone or in combination with foreign proteins in normal and hypersensitized hosts were effective in bringing about inflammatory changes in the cardiovascular system. The animals were kept under observation for from 2-11 months, during which time they had repeated injections. The histopathological changes observed ranged from acute necrotizing process, changes suggestive of rheumatic disease with Aschoff-like nodules, to low-grade chronic changes. The most severe reactions in the rabbit were found in the valvular endocardium and the myocardium. Cardiovascular lesions were present in 14 of the 16 monkeys employed. Periarteritis, myocarditis, and valvular endocarditis were more common and the vascular lesions more severe than in rabbits. The group of monkeys that was given streptococci had more pronounced lesions than any other experimental group. Since the results of studies designed to rule out spontaneous cardiovascular disease in this host species were not available, hearts from 16 monkeys dead from accidental or other non-infectious agents were obtained from Cincinnati, Pittsburgh, and Columbia, S. C. The presence of minimal changes limited to a single one of these animals made our findings in the experimental group of more interest.

Effect of esters of linoleic and arachidonic acids in the diet in relation to histologic features of the skin of dogs ARILD E. HANSEN, S. GRANT HOLMES* AND HILDA F. WIESE* *Depts of Pediatrics and Dermatology, Univ of Texas Med Branch, Galveston*

Young dogs showing gross and microscopic changes characteristic for fat deficient animals, at the age of 4 months, were given dietary supplements of methyl linoleate and ethyl arachidonate at the level of 1% of their caloric intake. At the end of 5 weeks, the epidermis had decreased from 6-12 cell layers to about 3 layers in thickness.

There was evidence of a tendency toward orientation of the cells back parallel to the surface. However, a remnant of palisading in the basilar portion was still present. Some prickling remained but few epidermal pegs were present. There was a marked decrease in the stratum granulosum and little evidence of parakeratosis. In the dermis the collagen fibres showed reduced edema and marked regeneration still leaving some cellular infiltration. The intimal cells of the blood vessels were free from edema. The epidermal cells of the hair follicles decreased from 6-8 layers to 2-3 cell layers, hyperkeratinization disappeared. The alveoli of the sebaceous glands returned towards normal. Essentially the same histologic changes were observed at the end of 5 weeks in the skin of the animals given 1% of their calories either as methyl linoleate or ethyl arachidonate. Grossly the skin and hair of both animals were greatly improved, although there was still some evidence of desquamation in the animal receiving arachidonate.

Histologic features of the skin of dogs on a low fat diet ARILD E. HANSEN, S. GRANT HOLMES* AND HILDA F. WIESE* *Depts of Pediatrics and Dermatology, Univ of Texas Med Branch, Galveston*

The skin and hair of dogs receiving 29% of their calories as lard or baconfat appear normal on gross examination. Histologic sections taken from the dorsal surface of the thigh, when stained with hematoxylin-eosin show the following structure: 1) The epidermis is 2-4 cell layers in thickness, the nuclei of the cells are oriented parallel to the surface and no epidermal pegs are present. 2) The cytoplasm appears syncytial, as the intercellular cytoplasmic bridges do not develop upon fixation. 3) The stratum corneum is thin, no nuclei are present in it and no stratum granulosum or stratum lucidum are evident. The dermis consists of sharply demarcated and loosely woven collagen bundles and the blood vessels have normal intimal cells. The hair follicles show an epidermal layer of 2-3 cells with the shafts intact. The sebaceous glands have average alveoli with compact cells. Sections taken from comparable sites of dogs which have been maintained on a low fat diet show distinctly different structures. The epidermis is thickened to 6-12 cell layers, the nuclei of the cells in the first 2-3 layers lie parallel to the surface, however, in the basilar portion the nuclei assume a vertical formation with palisading of cytoplasm and evidence of marked proliferation, driving epidermal pegs into the dermis. Prickling is present. The corneum is tremendously thickened into hyperkeratosis showing parakeratosis with marked disruption of the stratum disjunctum by scaling associated with the development of the stratum granulosum and luci-

dum The dermis is many times thicker than in the normal dog and the collagen although compact and crowded is nevertheless edematous and shows round cell infiltration The intimal cells of the blood vessels are also edematous The hair follicles have layers of 8-12 epidermal cells with papillary formation and hyperkeratinization is evident The alveoli of the sebaceous glands are shrunken with fibroblastic replacement These microscopic alterations are reflected in the gross appearance of the animals as shown by loss of hair, thickened skin and extensive desquamation

Association of mitochondria with the cyclophorase system JOHN W. HARMAN (introduced by D. MURRAY ANGEVINE) *Dept of Pathology, Univ of Wisconsin Med School, Madison*

The cyclophorase system of integrated enzymes obtained from liver, kidney and heart implements the complete oxidation of fatty acids, pyruvic acid and several amino acids by way of the citric acid cycle The suspensions, as thrice washed residue, contain chromosomes, mitochondria and very few ultra-microscopic particles Repeated washing removes completely the ultramicroscopic particles without alteration of oxidative activity Separated chromosomes are inactive, whereas the mitochondria retain the capacity for complete oxidation By use of differential homogenization, in correlation with mitochondrial counts and selective staining of the mitochondria, it is shown that the extent of oxidation is dependent upon both the integrity and number of mitochondria in suspension Both selective stains and phase microscopy reveal a structural complexity which is lost, concomitantly with loss of oxidation when the homogenates are treated with various transforming agents such as deionized water, sodium cholate, dinitrophenol, gramicidin, capryl alcohol and 30% urea Both oxidative phosphorylation and cyclophorase activity are phenomena found only in fractions containing mitochondria It is significant that all transforming agents tested block both processes simultaneously Under the conditions of differential homogenization the locus of various oxidative enzymes is shifted from the mitochondria into the 'microsome' fraction There is evidence that many fine 'microsomal' particles are derived from mitochondria in proportion to the extent of homogenization and that definition of these units is at present arbitrary and operational

Grafting of rabbit lymphatic tissue on chorioallantoic membrane of chick embryo SUSANNA HARRIS,* AND T. N. HARRIS *Children's Hospital of Philadelphia, Dept of Pediatrics, Univ of Pennsylvania School of Medicine, Philadelphia*

In the course of work on the role of lymphatic tissue of the rabbit in the formation of antibodies it was felt desirable to maintain lymph node tissue

outside the rabbit Slices of popliteal lymph node, freshly excised from the rabbit, were placed on the exposed surface of the chorioallantoic membrane (CAM) of developing chick embryos The lymphatic tissue plus the attached chorioallantoic membrane was removed after varying intervals of incubation from 2-10 days and histologic sections were prepared After 4 days it was seen that 1) Vascularization had taken place, extending away from the CAM in the direction of the rabbit tissue with nucleated erythrocytes filling many of the blood vessels 2) The rabbit lymphatic tissue was undergoing degeneration 3) Between the layer of CAM and the lymph node tissue a new cell type appeared which was identified as reticulum cells These cells usually occurred in groups or in a band extending between the CAM and the lymphatic tissue 4) On occasion nests of fresh, mature lymphocytes appeared, always in proximity to the reticulum cells in the direction of the CAM These cells occurred either in round or crescentic nests either at the periphery of the band of reticulum cells or in the midst of them The fresh lymphocytes were never seen in direct proximity to the old, degenerating lymphocytes

Influence of fractions of chick embryonic extracts upon proliferation of chick fibroblasts GEORGE M. HASS, ALBERT SCHWEITZER,* AND HELEN BOSCIA * *Rush Lab of Pathology, Presbyterian Hospital, in affiliation with Univ of Illinois College of Medicine, Chicago*

Small pieces of chick lung were explanted in micro-dishes They were cultivated continuously for 2 weeks *in vitro* in various media The radial growth of fibroblasts was measured periodically The control medium was composed of fresh clotted plasma from young guinea pigs The control medium was supplemented by crude embryonic extract or fractions thereof Crude extract was prepared by extracting crushed 5-7 day chick embryos with Tyrode's solution (1 cc/embryo) Plasma contained growth-promoting factors These accounted for 25% of growth obtained when equal parts of plasma and crude embryonic extract were used The activity of the crude embryonic extract was quantitatively retained on standing at 10° C for at least 7 days Dilution of crude embryonic extract (1:10) reduced its activity to little more than that of plasma Dialysis of crude extract at 10° C for 48 hours against distilled water showed that the non-diffusible, water-soluble fraction contained growth-inhibitory factors The non-diffusible, water-insoluble fraction contained all recovered growth-promoting factors About 50% of this fraction consisted of proteins which could not be redissolved in Tyrode's solution The remainder, which was readily dissolved, possessed 80% of the growth-promoting activity of the initial crude extract

Metabolic alterations in radioactive isotope concentration by malignant tissues induced by hormone pretreatment SAUL HERTZ AND J STEWART ROONEY * *Massachusetts Women's Hospital and Radioactive Isotope Research Inst, Boston*

In the course of study of patients with hopeless metastatic malignant disease of breast and cervix and (bone marrow) myeloma, it was noted that patients who had been treated by current dosage of testosterone had uptakes of P^{32} out of proportion to any such patients who had previously been observed without preliminary testosterone therapy. This led to a controlled study by tracer techniques and radioautographic study of malignant tissue obtained at biopsy and at post-mortem. The data to be presented indicate that such preliminary dosage of patients with these types of malignant disease promotes an increased uptake and retention of P^{32} . This approach to radiotherapeutic application of P^{32} affords a more likely possibility than has the administration of P^{32} to previously untreated subjects. A few results which have been obtained to date by this combination of therapeutic agents will be presented with tracer data on urinary excretion, tissue analysis and radioautographic demonstration of P^{32} in the malignant sites as compared with normal tissue distribution. It is in the direction of the above exemplified effects that the greatest hope of therapeutic application of the radioactive isotopes in cancer lie in our opinion, namely in the induction of increased specific radioactivities in the cancer cells. It is likely that other more potent means of obtaining these effects exist.

Ultra-thin sectioning of tissue for the electron microscope JAMES HILLIER AND MARK GETTNER (introduced by S MUDD) *RCA Labs, Princeton, N J and Sloan-Kettering Inst for Cancer Research, New York City*

Serial sections 0.2 μ thick and showing structure resolution and absence of new artifacts at the 20 m μ level have been cut successfully with a modified Spencer rotary microtome. Osmium-perfused normal mouse liver doubly embedded in collodion and paraffin was used in the development work. The microtome modifications included: 1) A change in the unit of advance from 1 μ to 0.02 μ by a modification of the inclined plane, 2) the addition of a spring to support 90% of the weight of the horizontal member, in order to reduce static friction in the horizontal slides, 3) the addition of a vibration-free motor drive to eliminate distortions of the machine introduced by manual operation, 4) the addition of a liquid trough to the knife edge in order to keep the sections stretched by surface tension, to keep the sections in order and to avoid destruction of the sections by sliding on the facet of the knife. With these modifications, 0.2 μ sections can be cut with a uniformity and accuracy of

better than 5% in thickness. The cut sections floating as a ribbon on the liquid surface are mounted for electron microscopic examination by simply lifting them out on a 200-mesh screen. It is shown that removing the embedding material introduces fine scale artifacts. A number of new but unidentified structures have been revealed in the resulting micrographs.

Further studies on the pathogenesis of experimental necrotizing arteritis RUSSELL L HOLMAN, CARROLL H LIPPARD AND BLAND GIDDINGS * *Dept of Pathology, Louisiana State Univ School of Medicine, New Orleans, and Dept of Biochemistry, Distillation Products, Inc, Rochester, N Y*

Previous studies have shown that, whereas either alone is ineffective, the sequence of 'standard high fat diet' for 8 weeks or longer then 'standard renal insufficiency' is regularly followed by 'typical arterial lesions' in mongrel dogs regardless of age and sex. The pathogenesis of these arterial lesions, which closely resemble those of rheumatic arteritis and periarteritis nodosa, is obscure but is being studied from the standpoints of a 'dietary factor' and a 'renal factor'. Various fatty substances have been bioassayed for the dietary factor by keeping the 'standard diet'—composed of liver, sugar, starch, tomato juice, salt mixture and fatty substance—isocaloric (75 calories/kg/day, 43% fat, 7% protein, and 50% carbohydrate) and varying only the fatty substance. The following fatty substances have yielded negative results: corn oil, lard, olive oil, coconut oil, mutton tallow and oleomargarine. Positive results have been obtained with certain samples of cod liver oil (in 36 of 40 dogs) and with creamery butter (in 8 of 8 dogs). Studies to date indicate that the renal factor (standard renal insufficiency has been produced by uranium nitrate, mercuric chloride, or bilateral nephrectomy but not by bilateral ureteral ligation) is an, as yet, undetermined metabolic product of renal tubular epithelium. The typical arterial lesions can be retarded or prevented by the addition of vitamin E or cholesterol, by omitting the noxious fatty substance for 4 weeks or longer, or by substituting casein for liver in the standard high fat diet. Conjectures on pathogenesis will be hazarded.

Effect of aureomycin and antibiotics on whole body irradiation JOE W HOWLAND, FRANK FURTH AND M COULTER (introduced by FRIEDA S ROBBINS) *Dept of Radiation Biology and Division of Med Services, Atomic Energy Project, Univ of Rochester School of Medicine and Dentistry, Rochester, N Y*

Results are presented on the exposure of more than 1200 rats and 18 dogs to lethal doses of filtered 250 KVP γ -radiation. Clinical doses of aureomycin or other combined antibiotics given to rats

after lethal x-radiation result in almost complete alleviation of the diarrheal state. Survival of life is prolonged an additional 5-7 days. Animals die of a sudden hemorrhagic death. Pre-radiation weight may be regained as early as 4 days after exposure. Bacteriological studies show suppression of normally occurring gram negative organisms in the intestinal tract. Dogs treated with only clinical doses of aureomycin (equivalent to 50-100 mg/kg) or combined aureomycin-streptomycin have shown no evidence of radiation sickness. Occasional bleeding tendencies are associated only with local trauma. Survival of life is prolonged from 10-14 days. Deaths in control animals occur between the 10th and 14th days, in treated animals, after the 22nd day. Mortality in the dog is considerably improved. To date all dying treated animals have shown sepsis with aureomycin or streptomycin resistant organisms 48 hours before death, with the same organism being cultured post mortem from all tissues examined. Pathological findings in the treated animals have not been in general typical of radiation disease. Lesions of the gastro-intestinal canal have not been observed in the treated animals. Bacteriological observations indicate a general alteration in the bacterial flora of the intestinal canal with a suppression of gram-negative organisms.

A possible new factor distilled from lard? HANS KAUNITZ AND CHARLES A. SLANETZ* (with the technical assistance of RUTH ELLEN JOHNSON*)
Depts. of Pathology and Animal Care, College of Physicians and Surgeons, Columbia Univ., New York City

Weanling rats were placed on a simplified diet containing all essential factors. The residue fraction of lard distilled at 215°C and 10⁻³ mm pressure (Distillation Products Inc.) served as source of fat. Gradually a disease developed characterized by weight deficit, roughened fur, eye symptoms and dehydration resulting in death after 3-8 months. Pregnancies terminated in death at parturition, live young frequently being found in the uterus. Epithelial lesions like those in vitamin A deficiency were observed. They were frequently accompanied by severe infections, especially of the urinary tract (pathology by Herbert Stoerk). Rats on the diet with undistilled lard were normal. Aversion to the diet and improper fat absorption were ruled out by determination of the food intake and fecal fat excretion. Toxicity of the residue seems improbable because addition of the distillate prevented the disease. Dried yeast or large doses of beta-carotene (Barnett Laboratories) or alpha-tocopherol (Hoffmann-La Roche) gave protection. Linoleic acid and water-soluble vitamins had no effect. It is improbable that the condition is caused only by oxidative destruction

of known factors by the lard residue inasmuch as addition of the distillate even 1-2 weeks after preparation of the diet also seemed to afford protection. It is therefore possible that the absence of an unknown factor is at least partly responsible for the condition.

Experimental cholesterol atherosclerosis in bilaterally adrenalectomized rabbits AARON KELLNER AND JAMES W. CORRELL* *Dept. of Pathology, New York Hospital-Cornell Med Center, New York City*

Cholesterol-fed rabbits with atherosclerosis were found to have adrenal glands which had a greatly increased lipid content and which were more than twice as heavy as those of normal animals. To determine whether this increased lipid reflected an alteration in the production of adrenal hormones that might play a role in the pathogenesis of atherosclerosis, a group of 8 rabbits was subjected to total bilateral adrenalectomy and then fed a high-cholesterol diet for periods of 2-5 months. The animals were maintained in good health by daily injection of desoxycorticosterone acetate (DCA) in peanut oil, 0.2 mg/kg, and sodium chloride was added to their drinking water. The completeness of the adrenalectomy was verified at the end of the experiment by the fact that every animal died within 26 days after the cessation of DCA injections, and by the failure to find any adrenal tissue at post-mortem examination. The adrenalectomized rabbits fed cholesterol developed significant hypercholesterolemia, although their blood cholesterol levels were somewhat lower than those of normal controls fed comparable amounts of cholesterol. All the adrenalectomized rabbits developed atherosclerosis of the aorta which in extent and severity was equal to that of the controls. It would, therefore, appear that the adrenal hormones, with the exception of the mineral regulating function of DCA, are not essential for the development of experimental cholesterol atherosclerosis in the rabbit.

Properties of nitrogen mustard protein reaction products A. R. KELLY,* GEORGE H. MANGUN,* BENJAMIN E. SANDERS* AND FRANK W. HARTMAN
Dept. of Labs., Henry Ford Hospital, Detroit, Mich.

Experiments on the nitrogen mustard, CH₃N-(CH₂CH₂Cl)₂·HCl, (HN2) sterilization of blood plasma indicate that, under certain conditions, HN2 couples with plasma proteins to form transformation products with heretofore unrecognized leukopenic activity. These substances, collectively called 'protein-imine' have been investigated chemically and pharmacologically and a colorimetric method developed for their detection. As a result of these studies, the HN2 plasma sterilization process, introduced by Hartman and Mangun,

has been modified to insure that inadvertent stabilization of toxic amounts of 'protein-immune' cannot occur. 'Protein-immune' is non-dialyzable, non-ultrafiltrable, and may accumulate in plasma under conditions which permit the complete degradation of unbound HN2. Protein fractionation following treatment of plasma with 500 mg/l of HN2 indicates that albumin contains approximately 56%, Fraction IV, 29% and fibrinogen, 6% of the total 'protein-immunes' found in all fractions. Intravenous and intraperitoneal injections of plasma, prepared to contain high concentrations of 'protein-immune,' produce neutropenia in mice with typical hypoplasia of bone marrow and lymphatic tissue. Young, protein-depleted animals are especially susceptible to this leukotoxic effect. However, in mice, significant toxicity and leukopenic activity of HN2 treated plasma is demonstrable only following repeated injections of 'protein-immune' equivalent to 5 times the usual transfusion volume of plasma treated with 4 times the usual sterilizing dosage of HN2, with stabilization of the active material at low temperatures and pH.

^{I¹³¹} as antigen label in circulating serum of non-immune rabbits WILLIAM C KNOX (introduced by KENNETH M ENDICOTT) *Natl Insts of Health, Bethesda, Md*

Bovine serum albumin (Armour) was labelled by direct iodination with ^{I¹³¹} to the extent of approximately 2 atoms of iodine/molecule of protein. Each of a series of 6 rabbits was given the labelled protein intravenously. Serum samples were obtained at time intervals beginning at 6 minutes and extending to 12 days following the time of injection. The antigen contents of the sera were estimated by both the quantitative precipitin tests and by measurement of the ^{I¹³¹}. On most of the samples, the 2 values were in good agreement. Each of a second series of 5 rabbits was given native bovine serum albumin intravenously. Serum samples were obtained as in the previous series and the antigen contents determined by the quantitative precipitin test. The labelled protein and native protein cleared in essentially the same manner.

Histological and biochemical changes in fatty livers with and without necrosis DIETER KOCH-WESER,* EMMANUEL FARBER,* PAUL B SZANTO* AND HANS POPPER *Hektoen Inst for Med Research and Depts of Pathology, Cook County Hospital and Northwestern Univ Med School, Chicago, Ill*

An attempt was made to investigate the pathogenesis of fatty liver with and without necrosis. The metabolic and morphologic alterations caused by CCl₄ and ethionine were followed in sequence and correlated with each other. Female rats fasted

for 12 hours were injected intraperitoneally with one dose of CCl₄ or ethionine and sacrificed at intervals from 2 to 240 hours thereafter. Histological preparations were stained with hematoxylin-eosin, Sudan IV and methyl-green-pyronine, the latter for the study of ribose nucleic acid distribution. Total lipids, phospholipids, cholesterol, total nitrogen, nucleic acids, acid soluble phosphorus, esterase, alkaline phosphatase and water were determined chemically in the liver and esterase, alkaline phosphatase, phospholipids and bilirubin in the blood. Ethionine produced a very marked fat accumulation in the liver without other structural or biochemical changes. The fatty infiltration appeared later and persisted longer than that produced by CCl₄. A few hours after administration of CCl₄, excess fat appeared prior to enzyme changes or morphologic necrobiosis. Later centrilobular necrosis and chemical changes were found. At that time the most constant biochemical changes were a sharp drop in liver esterase, coincident with the onset of necrosis, increase in total water content and neutral fat with the total phospholipids remaining constant. Biphasic blood changes accompanied the chemical and morphological alterations in the liver. The centrilobular disappearance of pyroninophilia is not accompanied by chemical decrease of ribose nucleic acid. It appears that the processes leading to necrobiosis and to fatty changes are not necessarily interdependent.

Role of aciduria in the development of hemoglobinuric nephrosis in dehydrated rabbits JOSEPH J LALICH AND SEYMOUR SCHWARTZ* *Dept of Pathology, Univ of Wisconsin Med School, Madison*

The influence of acid diets when combined with 5 days of food and water deprivation on the development of hemoglobinuric nephrosis was determined in rabbits. Three of 11 control animals died when ground oats, or oats and alfalfa, were followed by 5 days without food and water. Two of 3 rabbits which died had either necrosis of renal tubules or the liver. In tissues from 8 surviving rabbits we observed hyaline casts in the collecting tubules, moderate to severe swelling and vacuolization of epithelial cells in the proximal convoluted tubules and interstitial medullary edema. Eighteen test rabbits were given 18 gm/kg of homologous hemoglobin intravenously in divided doses. Eleven of 18 animals died of hemoglobinuric nephrosis. All rabbits with fatal hemoglobinuric nephrosis had variable increases in kidney weight with numerous pigment casts, while 9 had elevations of non-protein nitrogen (NPN) in excess of 190 mg %. The pigment casts were principally in the distal convoluted tubules. Associated with pigment casts accumulation there was focal necrosis of tubules in 5 and moderate to

severe degeneration of tubular epithelium in 6. All of these animals also had interstitial medullary edema. In 4 rabbits which survived and 3 which died of other causes, elevations of NPN, increases of kidney weight and pigment cast precipitation were minimal or absent. Experimental evidence, therefore, suggests that pre-injection acid diets and dehydration produce an antecedent tubular injury which predisposes to the accumulation of pigment casts, uremia and death.

Transmissible papilloma in monkeys BALDUIN LUCKÉ, HERBERT RATCLIFFE* AND CHARLES BREEDIS *Dept of Pathology, Univ of Pennsylvania School of Medicine, and Penrose Research Lab, Philadelphia Zoological Garden, Philadelphia, Pa*

Tumors in monkeys are relatively rare, and there is no record of such growths having been transmitted. Hence the occurrence of a spontaneous papilloma in a brown Cebus monkey led to attempts to transmit the growth, first to the same animal, and later to monkeys of the same and of other species. In 11 out of 13 cases the experiments were successful. When freshly prepared cell suspensions were inoculated into areas of scarified skin, new papillomas developed. Suspensions of frozen or of glycerinated material gave similar results. These growths were in turn transmissible to other monkeys. The causal agent of the papillomas appears not to be species specific, since the growths can be transmitted from New World monkeys to Old World monkeys. In all animals the lesions first appear as distinctly hyperemic patches within 2 weeks after inoculation, the epiderm and its supporting tissue in these areas gradually become raised, corrugated, and eventually form isolated or confluent projections up to 15 mm in height. To date (8 months after the beginning of the experiments) there has been no evidence of invasiveness, and most of the growths have regressed within from 4-6 months. Attempts are now being made to transmit the papilloma to animals other than monkeys.

Deficiency of alpha cells of pancreas as possible etiological factor in familial hypoglycemia IRVINE MCQUARRIE, E T BELL, BERNARD ZIMMERMANN* AND W S WRIGHT* *Univ of Minnesota, Minneapolis*

It has been demonstrated experimentally by previous workers that the alpha cells of the islets of Langerhans exert an anti-insulin or hyperglycemic (glycogenolytic) effect. The present report deals with metabolic and histologic studies on a small series of patients suffering from spontaneous hypoglycemia in whom absence of pancreatic alpha cells appears to be the most likely etiological factor. Special tests for dysfunction of the adrenal cortex, the adenohypophysis and the liver were

negative. No evidence of adenoma or hyperplasia of the beta cells of the pancreatic islets could be found in those patients in whom partial pancreatectomy was performed. However, examination of sections of the pancreas stained with Gomori's special stain unexpectedly revealed the total or almost total absence of alpha cells. Cytoplasmic granules in the beta cells were greatly diminished in number. That the patients showing these unusual characteristics represented a heretofore unrecognized endocrinological entity is suggested by the familial occurrence of the syndrome and the initial appearance of symptoms during the first months of life. Adrenocorticotrophic hormone was found to be highly effective in control of the hypoglycemia.

Nitrogen, phosphorus and calcium metabolism in the rachitic rat given excessive doses of vitamin A CHARLOTTE L MADDOCK* AND S B WOLBACH *Division of Nutritional Research, The Children's Hospital, Boston, Mass*

Because of the problems presented by the fact that excessive administration of vitamin A results in rapid repair of the rachitic metaphysis, with resumption of calcification of cartilage matrix and osteoid (WOLBACH AND MADDOCK *Federation Proc* 8:376, 1949), a study of the metabolism of the rachitic rat before and after excessive vitamin A administration was instituted, in the hope of throwing some light on the manner of action of this vitamin. Doses were 1000 IU per gram of body weight. Diets used were the one previously reported on, suggested by Dr Otto A Bessey, and and this diet modified by substitution of fibrin for casein with consequent reduced phosphorus content. Nitrogen, phosphorus and calcium metabolisms were primarily studied. The results indicate that the animal is thrown into negative nitrogen balance at a time when it is still consuming food, though in reduced amounts, that it excretes larger amounts of calcium than be accounted for by food intake, and that there is a shift in calcium excretion from urinary to fecal channels. Initial urinary phosphorus excretion, usually under 1 mgm per 24 hours, may increase terminally 20- to 50-fold. Combined fecal and urinary phosphorus is much in excess of food intake, so that a marked negative phosphorus balance occurs very shortly after giving the vitamin. Companion studies on starving rachitic animals do not give the same picture. The results suggest that vitamin A acts by speeding up metabolic sequences.

Coagulation defect of vitamin K deficiency compared with that caused by Dicumarol F D MANN,* J D MANN* AND J L BOLLMAN *Inst of Experimental Medicine and Division of Clinical Labs, Mayo Clinic, Rochester Minn*

Vitamin K deficiency was produced in rats by total external drainage of the intestinal lymph. By means of two-stage prothrombin determinations and co-thromboplastin assays, the resulting coagulation defect was compared to that produced by Dicumarol in comparable animals and at about the same rate. Dicumarol decreased co-thromboplastin activity much more than prothrombin while vitamin K deficiency produced greater decreases in prothrombin than in co-thromboplastin. Recognizing that the exact interpretation of these (or any other) coagulation tests may be subject to future modification, they do appear to demonstrate a difference between vitamin K deficiency and the effects of Dicumarol under essentially comparable experimental conditions.

Bone and tooth lesions in the rat resulting from ingestion and intraperitoneal administration of beryllium compounds E. A. MAYNARD,* W. L. DOWNS* AND J. K. SCOTT *Dept. of Radiation Biology, Univ. of Rochester School of Medicine and Dentistry, Rochester, N. Y.*

Weanling rats fed a diet containing 5% beryllium sulphate or beryllium carbonate developed rachitic lesions of the bone within 3 weeks from the beginning of treatment. After removal of the beryllium compounds from the diet the epiphyseal line and metaphysis slowly returned to normal. However, the original metaphysis (the 'primary spongiosa') was not resorbed, as would be expected with Steenbock diet rickets, but remained at its original position in the shaft for approximately a year. A new zone of provisional ossification ('secondary spongiosa') appeared and the long bones increased in length as expected. Beryllium (approximately 11 $\mu\text{g}/\text{gm}$) was present in the bone 280 days after removal of beryllium compounds from the diet. Overgrowth of incisors occurred within 2 months after removal of beryllium sulfate from the diet. Within a period of 3 weeks following the 1 p administration of a single dose of beryllium carbonate, or oxide (3000 mg/kg body weight) there appeared zones of hyperossification in the areas of active bone growth.

Further studies on thermostable leucocytosis factor of exudates VALY MENKIN *Agnes Barr Chase Fndn. for Cancer Research, Temple Univ. School of Medicine, Philadelphia, Pa.*

Earlier studies have demonstrated in exudates a thermostable leucocytosis-promoting factor (LPF). Subsequent and recent studies have shown that in exudates, particularly acid in character, in association with the pyrogenic factor, pyrexin, there is also a thermostable leucocytosis factor. It is these 2 factors which offer a reasonable explanation for the mechanism of leucocytosis with inflammation. When pyrexin, the pyrogenic factor obtained from the euglobulin fraction, par-

ticularly from acid exudates, is treated with $(\text{NH}_2)_2\text{SO}_4$ at half saturation and then dialyzed, a crude material results containing some amorphous pyrexin, the leukopenic factor, and the thermostable leucocytosis factor. This crude material is thoroughly centrifuged, the resulting supernatant fluid is diluted with distilled water (1:1) and poured into a tube which is sealed. This sealed tube is then placed in water boiling for 17-18 hours. The sealed tube is withdrawn. It is slightly cooled and needle-like crystals form. These crystals are collected. They induce only leucocytosis. They produce neither fever nor leukopenia. These crystals seem to represent the thermostable leucocytosis factor by itself. The crystalline material is not a polypeptide, but it is either a carbohydrate or at least it contains a carbohydrate group as indicated by the Molisch test. The material induces a leucocytosis by causing also a discharge into the circulation of a large number of immature granulocytes. The fact that the thermolabile leucocytosis factor (LPF) seems to be a polypeptide whereas the thermostable factor shows no evidence of being such a structure favors the view that the 2 leucocytosis factors are distinct entities.

Agglutination of bacteria by living white blood cells ERIC REISS,* ELIZABETH MERTENS* AND WILLIAM E. EHRLICH *Philadelphia General Hospital and Graduate School of Medicine, Univ. of Pennsylvania, Philadelphia*

Rabbits were immunized by injecting various bacteria into the pad of their hind feet. When antibody formation was in progress, the popliteal lymph nodes were removed and their cells studied in supravital preparations. It was found that certain cells of the nodes agglutinated the bacteria with which the animals were immunized. Photos of this phenomenon will be shown, and its significance in connection with the cellular sources of antibody will be discussed.

Neoplasms in rats treated with pituitary growth hormone I. Pulmonary and lymphatic tissues HENRY D. MOON,* MIRIAM E. SIMPSON, CHOH HAO LI AND HERBERT M. EVANS *Division of Pathology, Univ. of California School of Medicine, San Francisco, and Inst. Experimental Biology, Univ. of California, Berkeley, Veterans Admin. Hospital, San Francisco*

A group of 15 plateaued female rats was injected with pituitary growth hormone for periods up to 485 days. The controls received daily injections of albumin. The experimental rats responded to the injections of growth hormone by continuous growth. Many neoplasms of various types occurred in the rats injected with growth hormone. This paper is restricted to the neoplastic and hyperplastic changes involving pulmonary and lymphatic organs. Lymphosarcomas of the lung occurred in

6 of 15 rats injected with pituitary growth hormone whereas no similar tumors occurred in the control rats. In all rats treated with growth hormone there was hyperplasia of peribronchial lymphoid tissue. The tumors appeared to originate in such hyperplastic tissue.

Influence of crystalline vitamin B₁₂ on carbon tetrachloride poisoning CHARLES W. MUSHETT
Merck Inst for Therapeutic Research, Rahway, N. J.

In confirmation of results obtained by Popper and associates (*Proc Soc Exper Biol & Med* 71:688, 1949) with vitamin B₁₂ concentrate, it has been found that crystalline vitamin B₁₂ exerts a protective effect against the fatty metamorphosis, hydropic change and depletion of cytoplasmic ribonucleic acid in the livers of rats given a single oral dose of carbon tetrachloride. However, when both carbon tetrachloride and vitamin B₁₂ were given daily for a period of 3 weeks, vitamin B₁₂ failed to prevent the hepatic changes even at a dose level of 200 µg. In fact, the livers of the B₁₂-treated rats were relatively larger and contained more lipid than those of rats given carbon tetrachloride alone. Despite its inability to protect the livers of the poisoned rats, vitamin B₁₂, even at low doses, enabled the treated animals to grow at a considerably greater rate than the rats not treated with the vitamin. An explanation for the growth effect was found not to be due to differences in renal damage since this was negligible in both groups. In dogs given repeated doses of carbon tetrachloride, vitamin B₁₂ failed to show a protective effect during life as judged by morphologic blood picture, prothrombin time, icteric index and blood biochemical determinations. The continuation of vitamin B₁₂ treatment, however, after cessation of carbon tetrachloride dosing apparently brought about a more rapid reversibility of hepatic changes as indicated by gross and microscopic examination of the livers of the dogs.

Comparison of several chlorinated hydrocarbon insecticides with respect to pathological changes produced in rats by feeding at low levels, 1 to 100 ppm A. A. NELSON, O. G. FITZHUGH AND G. WOODARD *
Division of Pharmacology, Food and Drug Administration, FSA, Washington, D. C.

For this presentation only the chronic (1-2 years) feeding to rats of 100 ppm or less of certain commercially important chlorinated insecticides in the diet is considered. DDT, TDE, chlordane, toxaphene, methoxychlor, technical benzene hexachloride (BHC), and its alpha, beta and gamma isomers were fed, using the same stock diet and, except for BHC, the same rat strain. Preliminary observations show beta BHC and chlordane causing the greatest total damage, liver weight was increased at 10 or more ppm, while chlordane also

caused some kidney damage, and beta BHC at 100 ppm depressed growth. Alpha, gamma and technical BHC, and DDT, all required 50 or 100 ppm to increase liver weight, with only gamma BHC possibly affecting the kidneys. Data on TDE and toxaphene are less complete, but indications are that their effects are somewhat less than in the previous group. Methoxychlor showed no effect whatever at 100 ppm. In rodents only, these compounds (except methoxychlor) cause varying degrees of hepatic cell enlargement, with peripheral migration of granules. Minimal degrees of this effect, which is characteristic but not necessarily the most damaging and reaches a plateau after several weeks, were evident from as little as 5 ppm of DDT and chlordane. The significance of the results presented becomes apparent when it is realized that our human diet does contain small amounts of these chemicals, and that if man reacts as does the rat, the factor of safety is not inordinately high.

Generalized metastatic calcification combined with vascular changes produced by diet DOROTHY NELSON,* ANDREW C. IVY, PAUL B. SZANTO* AND HANS POPPER
Dept of Clinical Science of Univ of Illinois College of Medicine and Heltoen Inst for Med Research, Chicago, Ill.

Guinea pigs were placed on 4 diets for prolonged periods. Group I received milk with rabbit pellets and lettuce, group II received the same diet for 16 months, egg yolk being added for the first four, group III received milk and a semisynthetic diet designed to promote optimal growth. Its constituents apparently pertinent to the results obtained were 30% casein, 2% fat, 144 U.S.P. units of vitamin D and daily 20 mg of ascorbic acid. Group IV received the same diet as III plus cholesterol or egg yolk. The maximum amount of cholesterol ingested by groups II and IV was 100 mg daily. In group I only one animal, maintained for 3 years on the diet, showed vascular changes and metastatic calcification in kidney and adrenal. Group II showed vascular changes and minimal or no calcification. Group III presented extensive calcification in kidney, muscle, skin, stomach and adrenal. In the aorta the vasa vasorum contained lipophages, the intima was thickened, the internal elastic membrane was calcified and in the media the elastica was replaced by fibroblasts. The coronary arteries were partially or completely occluded by lipophages resulting in myocardial necrosis. The liver revealed fatty changes and cirrhosis. Group IV showed similar changes with more severe involvement of cardio-vascular system and liver. It is assumed that the metastatic calcification is explained by the mineral imbalance of these diets while the hepatic and vascular changes are secondary to the excess of cholesterol.

Determination of opsonins for *Br suis* ABOUT D POLLACK* AND JOSEPH VICTOR *Biological Dept, Chemical Corps, Camp Detrick, Md*

Phagocytosis of *Br suis* by blood leucocytes was investigated. Neutrophils were more active than mononuclear or eosinophilic leucocytes. Citrate, unlike heparin, inhibited phagocytosis. Most uniform phagocytosis occurred with agitation at 37°C for 30 minutes. Formalin killed organisms were phagocytosed to the same degree as living ones. Repeated washing of blood cells as frequently as 20 times in a modified Krebs solution containing 3% Knox gelatin P 20 did not impair phagocytic activity. On the basis of these findings a method was developed for determination of opsonin titre in heparinized blood. Cells and plasma were separated. Cells were washed 6 times in the Krebs gelatin solution, each time with 5-10 fold volumes of fluid. Plasma was diluted with Krebs gelatin solution. Cells were mixed with equal volumes of diluted plasma, 0.1 ml of the mixture was added to 0.1 ml of Krebs gelatin solution containing 1×10^9 formalin killed organisms. The mixture of blood cells, diluted plasma and bacteria were rotated 24-36 times each minute at 37°C for 30 minutes. Smears were made on glass slides warmed to facilitate spreading of the mixture. On the basis of statistical analysis of data, opsonin titre was defined as the lowest concentration of plasma in which 94-100% of neutrophils phagocytosed bacteria. The titre of normal human blood was slightly higher than that of dog. In clinical brucellosis, the titre may increase more than 100,000,-000 fold.

Pathogenesis of hypertension induced by renal constriction L J RATHER (introduced by A J Cox) *Dept of Pathology, Stanford Univ School of Medicine, San Francisco, Calif*

Blood pressures of 21 male albino rats were determined with the tail microphonic sphygmomanometer. All rats were then operated on within a 2-hour period, 11 being subjected to one stage unilateral nephrectomy plus contralateral figure-of-eight silk ligature renal constriction, 10 to unilateral nephrectomy and handling of the contralateral kidney. Blood pressures were determined on 20 occasions during the 50 days after the operation. The rats were then exsanguinated from the aorta under ether anesthesia and determinations made of blood creatinine, urea and hematocrit level. Heart and kidney tissue was weighed according to a uniform procedure. A third group of 8 rats was studied in a similar manner before and after removal of 75% of total renal tissue. Mean lines and frequency distribution curves of blood pressure were subjected to statistical analysis. A definitely significant increase in the mean of the measured pressures was observed in the constricted kidney

group within 4 days post-operatively and a probably significant increase within 2 days. In the rats with loss of 50% and 75% of renal tissue there was no post-operative hypertension. These experiments show, 1) the early onset of hypertension after renal constriction, 2) the absence of such hypertension in rats with loss of 50% and 75% of renal tissue, 3) the independence of these effects from the total mass of functioning renal tissue, 4) the independence of the development of hypertension from the development of fibrous constrictive perinephritis.

Sickling processes in anemia and trait erythrocytes with the electron microscopy of their incipient crystallization J W REBUCK, R M STURROCK AND E A MONAGHAN (introduced by F W HARTMAN) *Dept of Laboratories, Henry Ford Hospital, Detroit, Mich*

Sickling was studied dynamically in timed stages through progressive anoxia of erythrocytes from 3 cases each of sickle cell anemia and sickle cell trait. Formalin fixation arrested the processes at many stages in the transformation of promenisocytes to menisocytes. The early stages of sickling presented marked structural modifications of the hemoglobin-containing corpuscular interior leading to major structural patterns. Focal, eccentric thinning of the disc eventually included the entire corpuscular center as the promenisocyte diameter increased. In the thinned center, patchy hemoglobin aggregation and incipient intracellular crystallization were present. When aggregation of hemoglobin about the entire corpuscular rim was accompanied by peripheral angulation, the 'hollywreath' form appeared, if aggregation about the corpuscular rim was incomplete, an appearance of rupture of the rim was obtained. Anisotropoid angulation of central aggregates progressed to eccentric massing of the hemoglobin at one or more areas within the cell. Such hemoglobin-containing, intracellular masses presented intense peripheral spiculation further suggestive of incipient crystallization. As expected, trait cells with only a partial content of Pauling's defective hemoglobin presented far less spiculation than anemia cells containing defective hemoglobin alone, although both cell types eventuated in complete sickling. When Ponder's expansive forces were not operative early in a planoparallel direction, aggregation was tridimensional, central thinning and anisotropoid changes were less apparent, and incipient crystallization was evidenced only in peripheral spiculation or in geometric configuration of the early menisocyte. Unipolar filamentation and unipolar sickling which sometimes occurred substantiated the concept of incipient crystallization.

Effect of thallium, lead and other metals on development of chick embryo I. P. RIDGWAY, P. A. PATTERSON AND D. A. KARNOFSKY (introduced by C. P. RHODES) *Division of Experimental Chemotherapy, Sloan-Kettering Inst. for Cancer Research, New York City*

The effects of various metals on embryonic development were tested by injecting them into the yolk sac of the 4 day old chick embryo. *Thallium sulfate* produced a severe degree of achondroplasia at a dose of 1 mg/egg, and the embryos usually survived to hatching, although they failed to hatch. These embryos, at term, had parrot beaks, small heads, abnormal eyes and brains, presumably due to compression of these organs by the failure of skull growth, thick trunks and shortened extremities. The achondroplastic embryos were similar in appearance to those reported in hereditary chondrodystrophy, and in certain nutritional deficiencies. *Lead nitrate* was toxic to the 4 day embryo at 0.2 mg/egg, and it produced a remarkable hydrocephalic condition, with atrophic changes in the brain. A number of the embryos survived to hatching, although they failed to hatch. The simultaneous injection of effective doses of thallium and lead produced achondroplasia and hydrocephalus in the same embryo. Further studies on the localization of these elements and their mechanism of action in the chick embryo are under study. Twenty-six other metals have been injected into the chick embryo, but specific morphological changes have not occurred consistently. Their toxicity and effects on the development of the chick embryo will be presented.

Radioactive phosphorus studies in neoplastic disease J. STEWART ROONEY* AND SAUL HERTZ *Massachusetts Women's Hospital and Radioactive Isotope Research Inst., Boston*

P^{32} balances, external Geiger-Mueller distribution, and radioautographic demonstration of correlated studies on a variety of cancer patients following P^{32} administration will be discussed. The data to date in these experiments indicate that P^{32} uptake of certain tumor types can be modified by pretreatment of the patients by means of large dosage of steroid hormones and by the administration of ACTH. The clinical significance of these observations and the related therapeutic trials being carried out will be discussed in the exhibit planned in association with this presentation. A 'windfall' finding in the course of these studies is the demonstration that the thyroid gland is a site of P^{32} concentration. External Geiger-Mueller studies and radioautographs of P^{32} distribution in the normal thyroid will be demonstrated.

In vitro change of streptococcus from pneumotropic to neurotropic type and in vivo genesis of

filtrable pneumotropic and neurotropic phases of streptococcus EDWARD C. ROSENOW *Bacteriologic Research, Longview Hospital, Cincinnati, Ohio*

The strain of streptococcus studied was isolated from outdoor air in winter during a severe epidemic of influenza currently considered as due to Virus X. A pure culture in dextrose-brain broth from a single colony on blood agar after 3 consecutive serial dilution cultures representing a dilution of original inoculum of at least 10^{-22} was inoculated intracerebrally and/or nasally January 10 into mice and into a tube of chick-embryo medium. The chick-embryo culture was incubated at 35°C for 24 hours, then stored at room temperature in the dark until July 2. Pneumonitis developed in high incidence in the mice receiving the streptococcus. Emulsions and filtrates of emulsions of pneumonitic lungs or of the brain were then passed successively through 9 series of mice. Pneumonitis developed in increasing incidence both in those receiving emulsions and filtrates. The streptococcus isolated from the stored chick-embryo culture had lost affinity for the lungs and produced encephalomyelitis in high incidence. Emulsions and filtrates of emulsions of the encephalomyelitic brains were then passed through 12 series of mice. The incidence of encephalomyelitis increased greatly on successive passages irrespective of whether emulsions or filtrates of emulsions were inoculated. The filtrates which produced pneumonitis and encephalomyelitis respectively on successive mouse passages usually proved sterile but corresponding cultures of emulsions of pneumonitic and encephalomyelitic brains respectively yielded the streptococcus true to type in pure culture in high incidence. Control experiments proved negative. The 2 types of streptococci were agglutinated differentially by respective antisera and thermal antibody and convalescent sera.

Biology of granulomatous inflammation experimental spermatic granulomas MURRAY RUSSELL* AND NATHAN B. FRIEDMAN *Division of Labs, Cedars of Lebanon Hospital, Los Angeles, Calif.*

Previous work (*J. Urol.* 62:363, 1949) has shown that a peculiar granulomatous response results in response to extravasation of sperm from various genital ducts. Similar granulomas have been produced experimentally in rats by severing the vas deferens and permitting leakage of sperm into the surrounding tissues. Granulomas are not produced if previous atrophy of the testes is induced by intra-abdominal transfer. Some granulomas form in and about dilated tubules just as do those which occur spontaneously in spermatocele in man. Histologic studies suggest that the reaction is provoked by the sperm themselves rather than by the

accompanying fluid Lipoid materials as judged by stains for fat do not appear to be involved The histiocytic and macrophage response to presumably living cells rich in specialized nucleoprotein is a unique tissue reaction and deserves further study

Effect of diacetylene on viruses, bacteria and blood BENJAMIN E SANDERS, JOAN C WILSON, A R KELLY AND GEORGE H MANGUN (introduced by FRANK W HARTMAN) *Dept of Labs, Henry Ford Hospital, Detroit, Mich*

Diacetylene, $\text{CH}_3\text{COCH} = \text{CHCOCH}_3$, (DAE) has been found to be one of the most active virucides and bactericides investigated in connection with the problem of sterilizing blood plasma and whole blood In 95% ACD citrated human blood plasma, the following concentrations of DAE inactivated the test viruses (1% infected brain suspensions) after 5 days at 5°C (inoculations were made using 0.03 ml I C)

New Jersey Vesicular Stomatitis	10^{-4}	30 mg/l
Lymphocytic Choriomeningitis	10^{-4}	<20 mg/l
St Louis Encephalitis	10^{-5}	275 mg/l
Equine Encephalomyelitis	10^{-6}	<250 mg/l

In similar experiments with plasma containing 5×10^7 organisms/ml, the following organisms were inactivated after 48 hours, with the concentrations shown *E coli*, 200 mg/l, *A aerogenes*, 100 mg/l, *Staph aureus*, 300 mg/l On longer standing, the concentrations required decreased even further When added to plasma, DAE (500 mg/l) had no effect on the clotting mechanism Complement was completely inactivated and *B abortus* antibodies and syphilis antibodies were approximately inactivated by 500 mg/l No hemolysis was observed in whole blood treated up to 1000 mg/l Some retardation of the sedimentation rate was observed The intravenous LD₅₀ to adult mice is approximately 24 mg/kg Plasma treated with 300 mg/l of DAE, a dose found to be lethal to all test organisms, was incubated 48 hours at 5°C and injected into mice Five daily i.p. or i.v. injections of maximum tolerated volumes exerted no effect on survival or body weight Liquid oxygen was used for interim storage of the plasma

Kinetic pathology (motion picture) MACHTELD E SANO (introduced by VALY MENKIN) *Dept of Tissue Culture, Temple Med School, Philadelphia, Pa*

Kinetic pathology is the study, *in vitro*, of cells which have been under the influence of disease or are the direct result thereof Cells under the influence of disease may have had certain potentials activated so that these can be exteriorised These slides, of a classical Boeck's sarcoid, show the transition from epithelioid cells and lymphocytes

to almost a pure culture of cells 10 times as large In kinetic pathology one must differentiate between characteristic growth and fibroblastic growth 75% of diseased tissues give more characteristic growth in autogenous or human plasma as demonstrated by the study of 50 pleural effusions and 150 lymphnodes A cell present in all brain tumors, malignant or benign which resembles in many of its characteristics the 'gemistocyte', once called degenerate, is demonstrated in this movie of a glioblastoma multiforme It may have an altered metabolism but it is certainly not degenerate In its movement and behavior, it resembles to a certain degree the lymphocyte It needs further identification Cellular mitosis, separation from, and formation of the brain tumor are seen Routine tissue culture and microcinematography of tumors reveal to us unsuspected properties of cells which we cannot see by histopathologic methods Cells which have been under the influence of disease and which are histologically similar behave differently in tissue culture revealing activated potentialities which are of prognostic and diagnostic value

Polycystic mesonephros (goldfish kidney) HANS G SCHLUMBERGER *Dept of Pathology, Ohio State Univ College of Medicine, Columbus*

Twenty-three goldfish with polycystic kidneys were obtained from two ponds 150 miles apart In each, the fish were descendants of an original stock placed there 20 years before The fish in one of the ponds were also subject to neurofibromatosis The hereditary background of polycystic kidneys and neurofibromatosis in man may have a counterpart in these lesions of goldfish The cysts were multiple, measured from less than 1 mm to 6 cm in diameter, and occasionally greatly distended the abdomen Most of the cysts arose in the glomerular capsule, few involved the tubules Smith has shown (*J Biol Chem* 81 727, 1929) that in fishes the breakdown products of proteins are excreted by the gills, and that the kidneys of fresh water fish serve chiefly to get rid of excess water Renal function studies were carried out on 4 fish with polycystic kidneys and 5 normal controls The tail and body were encased in a thin rubber bag to collect all urine, and the fish placed in 200 cc of aerated water kept at about 18°C during the 24 hours of the test At the end of that time the urine, water, and blood were tested for the presence of nonprotein nitrogen, urea, ammonia nitrogen, and creatinine The results indicate that even when the kidneys are almost replaced by thin walled cysts, excretion of waste products by the gills and of water by the kidneys is not significantly affected

Malignant lymphoma, reticulum cell type (reticulum cell sarcoma), in albino rats F E SHAFFER, F P CLEVELAND, AND F R DUTRA (introduced

by E A GALL) *From the Kettering Laboratory of Applied Physiology, University of Cincinnati College of Medicine, Cincinnati, Ohio*

White rats procured in equal numbers from Albino Farms and Carworth Farms were used during a two year feeding experiment with a compound which was found to be innocuous. Neoplasms appeared in both treated and control rats with equal frequency, with an overall incidence of 20%. The compound used, therefore, had no significance in this respect. Of the 26 neoplasms observed in 130 animals, 8 were mostly fibro-adenomata of the breast. Eighteen (69%) were classified as malignant lymphoma, reticulum cell type (histiocytic). Primary sites of origin were as follows: lung (10), ileo cecal lymph nodes (4), thymus or lung (1), and undetermined (3). It is of interest that, while the primary tumors of the lung showed cytologic characteristics of malignancy, metastases did not occur. Primary sites could not be determined in 3 animals because of extensive metastases, however, it appeared probable that ileo-cecal nodes were primary sites in 2 of these, in the third, the largest tumor mass was one completely replacing the right kidney. Histologic pattern varied, in the number of giant cells, bizarre mitotic figures, and size and shape of cells, but all were consistent with malignant lymphoma of the reticulum cell type.

Effects of adrenal steroids in adrenalectomized phloridzinized rats ALBERT SEGALOFF AND ANNE S MANY * *Dept of Medicine, Tulane Univ of Louisiana and Alton Ochsner Med Foundation, New Orleans*

Young adult male rats of the inbred Fisher strain were adrenalectomized and were started on a 48 hour fast 2 days after adrenalectomy. At the beginning of the second 24 hours, the animals were injected subcutaneously with the necessary amount of steroid in 1 cc of sesame oil, and 50 mg of phloridzin suspended in 1 cc of olive oil and then placed in metabolic cages and urine collected for 24 hours with sodium fluoride and mineral oil as preservatives. Glucose, total ketones and total nitrogen were determined on the 24-hour collection on each animal. Five adrenal steroids were employed in this study. Compound S acetate in a dosage of 1 mg/animal gave essentially the control values found for adrenalectomized untreated animals. For all of the other steroids, Compounds A acetate E, F, and desoxycorticosterone acetate, there was increasing glucose, nitrogen and ketone excretion in the urine with increase of dosage of steroid. Our results would seem to indicate that at dosages which produce equivalent levels of glycosuria, Compound A acetate and DCA produce greater ketonuria than the other compounds. On the basis of the glycosuria attained, the steroids could be arranged in the following descending order of activity: Compound F, Compound E, Com-

pound A acetate, DCA and Compound S acetate. In none of the doses of steroids employed in this study was it possible to attain the excretion of glucose, ketones or nitrogen during the 24-hour period that was attained by normal intact animals handled in the same manner.

Fate of gold colloids introduced into circulation of the mouse C W SHEPPARD,* J FURTH AND LEON WISH * *Biology Division, Oak Ridge National Lab, Oak Ridge, Tenn*

The disappearance from the circulation of gold colloids labeled with the isotope¹⁹⁸ Au has been investigated in mice. Particle size was determined by electron microscopy. Animals of an inbred strain of uniform age and sex were injected in groups and sacrificed serially. At autopsy the activities of blood and tissues including whole organs were obtained, with an automatically recording gamma-ray ionization chamber. By including determinations of the initial activity of the total animal and of the carcass, excellent material balances were obtained. Highly consistent behavior was observed due to the uniformity of the animals. During the first few minutes following injection most of the activity was found in the circulation. After 3 hours, 88-92% was found in the liver and spleen. No further change was observed up to 3 days following injection. The rate of disappearance of activity from the circulation was slower than in other species hitherto studied. Autoradiographs of tissues obtained shortly after injection show a diffuse localization primarily on the endothelial linings of the capillaries of different organs and of the sinusoids of the liver and spleen. This may be due to the adherence of circulating activity at the moment of death. With increasing time between injection and death a progressive relative increase of activity in the macrophages of the liver and spleen is observed with a corresponding decrease in the activity adhering to the linings.

Sex differences in skeletal development of mice fed a high fat diet MARTIN SILBERBERG AND RUTH SILBERBERG *Snodgrass Lab, City Hospital, and Dept of Pathology, Washington Univ School of Medicine, St Louis, Mo*

In growing mice, the course of the skeletal time curve could be accelerated and articular age changes produced prematurely by feeding a ration of Purina Laboratory Chow with 25% lard added. This diet contains adequate amounts of protein, carbohydrates, minerals and vitamins. Since the female skeleton develops more rapidly and responds to hormonal stimulation less conspicuously than the male skeleton, it seemed interesting to compare the skeletal effects of the high fat diet in both sexes. Twenty-six virgin females of strain C57 black were fed the high fat diet from the time of weaning on and killed together with 26 controls

fed the stock ration after $\frac{1}{2}$, 1, 2, 3, or 5 months' observation. The females fed the high fat diet showed better gain in weight and, histologically, faster epiphyseal development and earlier onset of articular age changes than controls fed the stock diet. However, the differences between the 2 groups of females were less pronounced than those occurring in corresponding groups of males. The weaker reaction of the female may be due to sex differences in food intake or to the comparatively more advanced physiological age of the female skeleton at the beginning of the experiment. Whatever the mechanism involved, because of their weaker response females are less suited than males for studies concerning effects of nutritional factors in skeletal growth and ageing.

Strain differences in skeletal growth and ageing of mice fed a high fat diet. RUTH SILBERBERG AND MARTIN SILBERBERG *Snodgrass Lab, City Hospital, and Dept of Pathology, Washington Univ, St Louis, Mo*

Under the influence of a high fat diet, female C57 mice showed less acceleration of epiphyseal development and articular ageing than males. The faster physiological ageing of the female skeleton was considered to be a possible cause for this sex difference. If this assumption was correct, animals belonging to a strain with a rapid rate of skeletal ageing (dba) should likewise be less susceptible to the influence of such a diet than animals belonging to a slowly ageing strain (C57 black). At weaning, 60 male and female dba mice were put on a diet of Purina Laboratory Chow with 25% lard added. Together with 48 male and female controls fed the stock ration, the test animals were killed after $\frac{1}{2}$, 1, 2, 3, or 5 months' observation. The dba mice fed the high fat diet did not gain more weight than their controls kept on the stock ration, the corresponding C57 males gained 25% and the females 10% more than their controls. Strain differences manifested themselves also histologically. In dba males, the high fat diet caused only slight acceleration of epiphyseal development and articular ageing, dba females were hardly affected. As compared with the response of C57 males and females, there was thus in both sexes of the dba strain a distinctly decreased effect of the high fat diet. Possibly, an as yet undetermined age change in the growing cartilage may be the common denominator for strain and sex differences in the response to various nutritional and hormonal stimuli.

Metabolite antagonists in experimental cancer guanazolo. BORIS SOKOLOFF, JAMES B REDD AND RAYMOND DUTCHER (introduced by LEO LOEB) *Southern Bio-Research Lab, Florida Southern College, Lakeland*

Assuming that cancerous cells, contrary to nor-

mal cells, are unable to synthesize guanine from adenine, G Kidder *et al* submitted mice, bearers of transplanted adenocarcinoma Eo 771 and of spontaneous mammary cancer, to treatment with guanazolo. In the case of adenocarcinoma, treatment started 6 days after transplantation, with a daily dose of 0.5 mg given twice a day. They noted a complete inhibition of growth, which regained its force as soon as the treatment was discontinued. In our experiments we used August Rat Carcinoma, a fast-growing tumor which never regresses, at least in our strain. Altogether 200 rats, with an average weight of 180 gm, were used for experimentation. Fifty rats were given daily injections (subcutaneous) of guanazolo, twice a day, with a total daily dose of 40 mg/kg of weight. The treatment was started on the 6th day after inoculation when the tumor was of pinhead size. We obtained a complete inhibition in 75% of tumors (36 rats) with a slow growth in the rest of the tumors. At the end of 3 weeks of the treatment, the average size of the tumor was 2.2 cu cm against 9.1 cu cm in the control group (25 rats). At the end of the 3rd week the treated rats showed some sluggishness and loss in weight (12% of original weight), with one rat dead. In the 2nd series of experiments, the treatment began when the tumors had reached the average size of 3.2 cu cm (50 rats). The dose of guanazolo was increased to a daily total dose of 100 mg/kg of weight. After 3 weeks of treatment the average size of the tumor had increased to 5.6 cu cm as against 9.9 cu cm in the control group. This dose, however, produced a much stronger toxic effect on the animals with 8 rats dead at the end of 3 weeks' treatment while in the control group no mortality was observed. Histological examination of the adrenal gland revealed some pathological changes in the reticular and fasciculata zones of the gland.

Autoantibodies to in vivo damaged kidney. Relationship to nephrotoxin. DOUGLAS H SPRUNT, WAYNE R ROGERS* AND ANNA DEAN DULANEY* *Inst of Pathology, Univ of Tennessee, Memphis*

The usual method for production of autoantibodies (brain, kidney, heart, placenta, liver) has consisted of immunization of laboratory animals with normal tissues in combination with bacterial toxins or other injurious agents. Complement fixation, precipitin tests, and collodion agglutination have been used for the *in vitro* demonstration of such antibodies. We have employed a new procedure, namely *in vivo* injury of kidneys with Staphylococcus toxin and the subsequent use of these kidneys for the production of autoantibodies. The toxin was given to rabbits in 4 daily doses of 0.1 cc by the intraperitoneal route, or in single doses of 1 cc, incorporated in a water-in-oil emulsion with *M. tuberculosis* (Freund), and introduced subcutaneously. The kidneys were per-

fused with physiological saline solution, portions removed for histological examination, and a finely divided saline suspension prepared from the remaining tissues. When evidence of the pathologic state of the kidneys was obtained these preparations were used for immunization of rabbits by i.v., i.p., and s.c. routes over a period of 3 or 6 weeks. The sera of rabbits were used in complement fixation tests with kidney (normal and damaged) and other rabbit tissues. Sera of rabbits which had received normal kidney plus toxin, kidney or toxin served as controls. Antibodies were demonstrated for all rabbit tissues in sera of rabbits who had received damaged kidney or normal kidney plus toxin. The highest titers were obtained with the anti-damaged-kidney sera and the corresponding antigen. These sera were used *in vivo* to test their nephrotoxic property.

Cytochemical changes in the adrenal cortex of the rat following the administration of cortisone

ROBERT B. STEBBINS (introduced by H. C. STOERK) *Merck Inst for Therapeutic Research, Rahway, N. J.*

Daily subcutaneous administration of cortisone acetate (3 mg/day) produced marked atrophy of the inner zones of the adrenal cortex, while the glomerulosa remained intact. After from 10-42 days of treatment, the lipid and ketosteroid-like material of the subcapsular zone were, in general, unchanged. In contrast, the inner cells of the cortex showed a marked depletion of these substances. Following 42 days treatment, histochemical examinations demonstrated the almost complete loss of these components from the inner zones of the cortex. The glandular parenchyma resumed essentially a normal appearance within 17 days after discontinuance of the drug.

Marrow extracts affecting blood and marrow leukocytes

BERNHARD STEINBERG, ALBERT A. DIETZ* AND RUTH A. MARTIN* *Toledo Hospital Inst of Med Research, Toledo, Ohio*

We extracted from cattle marrow several fractions which decreased and raised leukocytes and platelets in the blood. This presentation deals with the extract which lowered leukocytes. The marrow was aged at 5° C for 5 days and at 26° for 2 days. Each 1000 gm were extracted with 500 ml of water at 75° C for 30 minutes. The fat was discarded. The water extract was precipitated with acetone at pH 4.5. Residue of 5.2 gm was suspended in water at pH 7 and ammonium sulfate added to $\frac{1}{2}$ saturation. The supernatant was dialyzed, filtered and precipitated with acetone at pH 4.5. The residue, 1.2 gm, was suspended in water and heated 3 minutes at 95° C. Acetone was added to supernatant at pH 4.5. The residue, 0.66 gm, was suspended in water at pH 8.1 and digested with trypsin for 24 hours. The trypsin was inactivated

at 80° C for 30 minutes. Acetone was added to supernatant at pH 4.5 and a water soluble residue of 0.4 gm obtained. Each of 50 rabbits were injected subcutaneously with 0.1 gm of extract. A decrease in blood leukocytes occurred in 4 hours and continued for 3-5 days. Greatest decrease was 88.8%, remaining at 75% of normal for 3 days. The bone marrow showed granulocytic hypoplasia due to inhibition of maturation. With an increase in peripheral leukocytes, immature granulocytes appeared. It is postulated that marrow contains substances which maintain a physiological equilibrium of blood cells.

Inhibition of the tuberculin reaction by cortisone in vaccinated guinea pigs

H. C. STOERK *Merck Inst for Therapeutic Research, Rahway, N. J.*

The group of diseases which Hench *et al* observed to be benefited by cortisone are generally assumed to be due to a hypersensitivity of the necrotizing (tuberculin) type. Cortisone is known to produce a marked loss of lymphoid tissue. The latter for a long time has been suspected to be related to antibody formation and has been shown to carry the antibody specific to the tuberculo-proteins. In sensitized animals a failure of the tuberculin reaction (or of anaphylaxis) to appear has been observed following a great variety of injurious stimuli. It seemed plausible to assume that this phenomenon of non specific desensitization may be related to increased adrenal cortical activity. Accordingly, the effect of cortisone has been investigated in the various types of hypersensitivity in guinea pigs. It was found that hypersensitivity of the anaphylactic type was not prevented with cortisone. In the Arthus reaction, cortisone administration reduced the amount of fluid exudation, but not the cellular infiltration in the tissues. The amount of necrosis and of hemorrhage was not appreciably diminished. In guinea pigs vaccinated with heat killed human tubercle bacilli, the tuberculin reaction could not be elicited when cortisone was administered prior to the injection of old tuberculin. Previously, a reduction of antibody concentrations has been observed following the administration of cortisone. It is therefore likely that the suppression of the tuberculin type of hypersensitivity, is at least in part related to an increased degradation of antibody protein by cortisone.

Alterations of cytoplasmic basophilia in liver injury and its relation to serum proteins

PAUL B. SZANTO*, HANS POPPER, DIETER KOCH-WESER* AND J. DE LA HUERGA* *Hektoen Inst for Med Research and Depts of Pathology, Cook County Hospital and Northwestern Univ Med School, Chicago, Ill.*

The alterations of cytoplasmic basophilic material in various examples of human and experi-

mental liver injury were studied and in the humans correlated with serum proteins. This material was identified as ribonucleic acid by pyronine, thionine, galloxyanin, azure II and by specific digestion with ribonuclease. The RNA of the liver cells was reduced in various forms of liver damage such as viral hepatitis, toxic hepatitis and active cirrhosis and less so in even long-standing biliary obstruction. It appeared increased in tumors, regenerating and compressed liver cells. It was similarly decreased in various forms of experimental liver cell damage. In chronic liver injury the decrease ran parallel with nucleolar changes. In individual human cases it ran parallel to reduction of serum albumin. In liver diseases, especially so in viral hepatitis and active cirrhosis, the cytoplasm of the Kupffer cells and the mesenchymal cells in portal triads revealed marked RNA reaction. Markedly bile-laden Kupffer cells, even if proliferated, were free of RNA as chiefly seen in obstructive jaundice. In the human the RNA in Kupffer cells and other mesenchymal cells occurred mainly in conditions with elevated serum gamma globulin. RNA reaction in hepatic epithelial and mesenchymal cells seems to indicate cellular activity. The results support the opinion that albumin is formed by the hepatic epithelial cells and indicate that at least some gamma globulins are formed by the Kupffer and portal mesenchymal cells. The latter process appears stimulated by most forms of liver damage.

Study of fibro-elastic intimal arteriosclerosis following hypothermal medial degeneration of young and old rabbits. C. BRUCE TAYLOR,* DAVID BALDWIN* AND GEORGE M. HASS. *Rush Lab of Pathology, Presbyterian Hospital, in affiliation with Univ of Illinois College of Medicine, Chicago*

Local lesions were produced in aortas of juvenile and senile rabbits with a hypothermal instrument. Animals were killed at intervals up to 24 weeks. Lesions were studied microscopically. Aneurysmal dilatation occurred immediately. Inflammatory reaction was insignificant at any stage. Degeneration of medial smooth muscle was advanced one week after injury and complete at 2 weeks. Elastic lamellae were fragmented at 2 weeks. Medial calcification appeared at 3 weeks and was complete at 5 weeks. In juvenile rabbits calcium slowly resorbed. In senile rabbits cartilage and bone appeared. Lesions of juvenile rabbits gradually contracted, those of senile rabbits showed persistent aneurysmal dilatation. Intimal proliferation with collagen deposition begun at 2 weeks and was complete at 5 weeks. Intimal proliferation was much greater in juvenile rabbits. In all animals new formation of elastic tissue was apparent in the thickened intima in 3 weeks. At

24 weeks, elastic fibrils in the proliferated intima resembled normal medial elastic lamellae. Smooth muscle cells appeared in the thickened intima at 2 weeks. At 6 weeks they were occasionally as abundant as those in normal media. At 4 weeks, a new internal elastic membrane was detectable. It was almost completely formed at 20 weeks. Since proliferated intima provided a matrix for new elastic tissue lamellae and smooth muscle cells, quantities of all elements were much greater in juvenile rabbits. Essentially, a new vessel wall was partly reproduced within the framework of the proliferated intima.

Action of 4-amino-pteroylglutamic acid on the early pregnancy of rats and mice. J. B. THIERSCH AND F. S. PHILIPS (introduced by C. P. RHODES). *Pharmacology Section, Division of Exper Chemotherapy, Sloan-Kettering Inst for Cancer Research, New York City*

4-Amino-pteroylglutamic acid was given to pregnant mice and rats in small doses which caused transient depletion of their marrow to approximately half its cellular contents. The mothers were not otherwise affected significantly. The compound when given in the first week of pregnancy produced death of the foeti but when given during the second week the litters survived. A single observation in a bitch suggested a similar action in this species. The results of these experiments and their bearing on fertility, seasonal breeding, spontaneous abortion and chlorosis are shortly discussed.

Sarcomatoid growths resulting from mammary carcinoma cells that had sojourned in immune mice. HELENE WALLACE TOOLAN* AND JOHN G. KIDD. *Dept of Pathology, New York Hospital-Cornell Med Center, New York City*

Tumors often result when the cells of a transplantable C3H mammary carcinoma are transferred back to susceptible C3H hosts after several days' sojourn in the subcutaneous tissues of A mice immune to them, as previous studies have shown (*Federation Proc* 8:360, 373, 1949). The growths, however, are not mammary carcinomas but fibrosarcomas, as judged histologically. This has proved true in 13 of 15 experiments, in no instance have ordinary mammary carcinomas been obtained from cells that had lain as long as 6 days in the subcutaneous tissues of immune hosts. The sarcomatoid growths are comprised of spindle-shaped cells that often lie whorled in parallel bundles and regularly produce large amounts of collagen. One of them has been transplanted in series in C3H hosts, during many months its cells have retained their elongated form and continued to lay down collagen. They differ notably from the polyhedral elements that comprise the transplantable mammary carcinoma, and they con-

tinue to arrange themselves in bundles that differ distinctively from the solid cords and pseudo-papillary masses of the original growth, a carcinoma simplex alveolare. It is noteworthy, however, that some time ago, after repeated transfers, a small proportion of the cells of the mammary carcinoma, especially those at the margins of the syncytial masses, assumed a more elongated form and were not infrequently surrounded by small amounts of collagen.

Lipo-protein of Gaucher's Disease L. L. UZMAN
(introduced by SIDNEY FARBER) *Children's Medical Center, Boston, Mass*

The spleens of two cases of Gaucher's Disease were removed surgically, frozen in dry ice and processed as follows: 100 gm of tissue were first extracted with 500 ml cold distilled water in a Waring blender. Following centrifugation, the residue was next extracted with cold 10% NaCl. This was centrifuged at 9,000 *g* and the residue again extracted at +5° C with 10% NaCl for 16 hours. This second saline extract was centrifuged at 9,000 *g* and supernatant diluted with 7 vols distilled water. After 24 hours standing in the cold, the ppt was collected, dissolved in 4% NaCl, alkali added to pH 8.0 then brought to pH 4.2 with acid. The precipitate was collected, re-dissolved and re-precipitated in the same manner 4 times, dialyzed and lyophilized. The fluffy white material thus obtained is a lipo-protein containing 62% lipid. The lipid moiety is kerosene and accounts for more than 70% of the total tissue cerebroside. The lipid is very strongly bound, being split from the protein only after 6½ hours boiling with CHCl₃, CH₃OH, or on treating the lipo-protein with 8M-guanidine hydrochloride. Osmotic pressure data reveal a number-average *M* wt of above 300,000 for this lipo-protein which also exhibits a high organic anion affinity comparable to serum albumin. No free -SH groups are detectable before denaturation, and the intact lipo-protein is resistant to tryptic and catheptic digestion. It appears that the lipid in Gaucher's Disease is 'bound' within the cell as a lipo-protein.

Quantitative relations between acute hepatic necrosis and survival in rabbits GORDON VAWTER,* GEORGE M. HASS AND C. BRUCE TAYLOR*
Rush Lab of Pathology, Presbyterian Hospital, in affiliation with Univ of Illinois College of Medicine, Chicago

Albino rabbits, weighting 3-9 pounds were used. During ether anesthesia, the liver was exposed surgically. Using partial aseptic precautions, multiple local areas of acute necrosis were produced in the liver by direct application of an instrument cooled to -60° C. Experience indicated that if animals survived for 3 days they would show no future symptoms attributable to the hepatic

injury. Hence, experiments were terminated either by death following hepatic damage or by killing the animal at the end of 3 days. Bacteriologic studies were made. The liver was removed and its weight and volume were determined. Volume of acute hepatic necrosis was calculated from direct measurements of multiple sharply defined lesions. No anaerobic or significant aerobic bacteria were isolated from the liver. Results indicated that the most important factor responsible for death was the volume percentage of liver, rendered non-viable by freezing. A second factor, the area of contact between normal and non-viable hepatic tissue, was also important. By combining these 2 factors an index for defining with considerable accuracy, the relations between acute hepatic necrosis and survival of the animal was established. This affords a quantitative basis for further study of causes of death and of associated degree of renal damage observed in these animals. The principal advantages of the method are that the hepatic damage is quantitatively and qualitatively reproducible and that no other organ is directly damaged by the method of producing acute hepatic necrosis.

Demyelination induced experimentally by means of lipase F. STEPHEN VOGEL (introduced by JOHN G. KIDD) *Dept of Pathology, New York Hospital-Cornell Med Center, New York City*

Purified lipase made from hog pancreas has regularly produced focal areas of demyelination when injected intracerebrally in rabbits. The lesions became manifest within 48 hours and persisted for at least ten days. They were characterized by complete loss of myelin and moderate gliosis with little or no destruction of other neuronal structures and no noteworthy inflammation, in these respects resembling closely the plaques of multiple sclerosis. The demyelination was often accompanied by paresis. Neither resulted when trypsin and chymotrypsin were injected intracerebrally in control animals. An area of demyelination involving the basal ganglia, together with atrophy of the regional ganglion cells without inflammation, developed following repeated injections of lipase intravenously in a single rabbit. When segments of normal spinal cord from various species were incubated with solutions containing the purified lipase, demyelination regularly resulted, the change being similar to that produced by the plasma of patients with multiple sclerosis (*Arch Neurol & Psychiat* 23:713, 1930, 27:367, 27:375, 1932). Trypsin and chymotrypsin likewise again failed to produce this effect in control experiments.

Adenosinase, adenase and xanthine oxidase of lymphoid tissues BERNARD M. WAGNER* AND WILLIAM E. EHRLICH *Philadelphia General Hos-*

pital and Graduate School of Medicine, Univ of Pennsylvania, Philadelphia

The enzyme content of lymphoid tissues associated with nucleoprotein chemistry has been studied by Barnes. Using a bio-assay method, he found that these tissues excelled in adenosinase. As the enzyme is important in nucleoprotein synthesis, and this appears to be closely related to antibody formation, it was hoped that a systematic study of the various enzymes present in the lymphoid tissues associated with nucleic acid metabolism would throw light on the protein-synthesizing function of their cells. The method of differential ultra-violet spectrophotometry of Kalckar was employed. The results obtained will be presented and discussed.

Obesity and food requirements of albino mice following administration of goldthioglucose S H WAXLER* AND G BRECHER *Army Med Dept Research and Graduate School and National Insts of Health, Bethesda, Md*

Brecher and Waxler recently reported the experimental production of obesity in mice by single injections of goldthioglucose. About 30% of the survivors of a toxic dose of the compound reached weights of 50-80 gm 6-12 months after injection. The excess weight was due to a marked increase of depot fat, but no morphologic changes were found in any organs except for a centrilobular fatty infiltration of the liver. A study of the food requirements of the injected mice showed that the food consumption of injected animals which become obese was increased both during the first 3 months of rapid weight gains and during a subsequent 3-month period of relatively slight additional increments in body weight. The obese animals tolerated prolonged starvation (up to 19 days) utilizing practically all of their excess fat during that period. On refeeding, the animals regained their pre-starvation weights, but weight gains could be delayed by restriction of food intake.

Cellular dynamics in intestinal mucosa, quantitative measurements of effects of antimetabolic agents, effect of nitrogen mustard on cell division and differentiation BANICE WEBBER,* BENJAMIN R CRAIG* AND NATHAN B FRIEDMAN *Division of Labs and Dept of Radiotherapy, Cedars of Lebanon Hospital, Los Angeles, Calif*

Mitotic counts are easily performed on sections of rat duodenum. By doing counts at intervals after treatment with various agents, clear-cut curves of antimetabolic activity, for example, may be obtained. There is usually a period of excessive mitotic activity which follows the phase of depression by irradiation or nitrogen mustard. It is simple by this method to appraise the effects of combinations of these agents with various time

and dosage factors. Study of rats treated with nitrogen mustard reveals that the inhibition of mitotic activity without interference in the differentiation of goblet cells which characterizes radiation reaction in the rat duodenum (*J Exper Med* 81:553, 1945) can be duplicated by this agent.

Histologic and enzymologic changes in lungs of rabbits with airborne tuberculosis CHARLES WEISS, MARIAL L BOYAR* AND H L RATCLIFFE* *Jewish Hospital and Penrose Research Labs, Zoological Society, Philadelphia, Pa*

Female albino rabbits were infected with either a human virulent strain H37-Rv or a bovine, Ravenel culture of tubercle bacilli, employing the Wells apparatus for the quantitative study of droplet nuclei infection (*Am J Hyg* 47:1948). In animals killed 52 days after infection when the tuberculin reaction was positive, the lungs showed from 10 to 16 discrete tubercles, about 10 mm in diameter and protruding about 5 mm above the pleural surface. In the interior of the tubercles there were distinct areas of caseation surrounded by inflammatory zones. Numerous small, scattered secondary tubercles were also observed. Employing chemical methods previously described (*Proc Soc Exper Biol & Med* 72:236, 1949) it was shown that caseous material, which had been freed as far as possible from surrounding inflammatory tissue, is not enzymatically inert but hydrolyzes BAA and LA. However, its rate of hydrolysis is very much slower than that of the surrounding inflammatory 'wall'. Other rabbits were infected with either human or bovine tubercle bacilli by means of the Wells apparatus and, 6 to 7 weeks later, exposed in the same manner to aerosol solutions of PPD in doses of approximately 8×10^{-3} mg. These animals were killed 48 hours later. The tubercles now presented increased areas of caseation which showed decreased density and an increased tendency toward liquefaction.

Cytoplasmic reactions of hepatic parenchymal cells to experimental injury in rodents and dogs W LANE WILLIAMS AND ALBERT J GREENBERG* *Depts of Anatomy and Medicine, Univ of Minnesota, Minneapolis*

Liver injury was produced in mice by CCl_4 or by starvation for 1-8 days, dogs by CCl_4 for 5 days-1 year, by starvation for 35 days or low protein diets for 30-300 days (3% to 10%, with and without a large intake of alcohol), and young rats by a low protein-high fat diet for 4-8 weeks. Initial lesions were centrilobular and mutual cytoplasmic responses were a decrease in ribonucleic acid, a positive alkaline phosphatase reaction (absent in normal liver cells) and beginning liposis. In dietary deficient animals fat deposition was progressive. In CCl_4 -treated animals necrosis of central cells ensued. Continued treatment (dogs) with

CCl_4 produced massive cirrhosis with parenchyma consisting of nodules of hyperplastic cells. Such cells were large and hyperbasophilic (cytoplasm). Considerable basophilia remained after digestion with ribonuclease but was removed by the trichloroacetic acid (Schneider) method for extraction of nucleic acids. Significant cirrhosis did not occur in dogs on low protein diets (with or without alcohol). Such livers were fatty. Most parenchymal cells contained fat and were hypobasophilic, but other cells were non-fatty and hyperbasophilic like those of chronic CCl_4 -treated dogs. It seems significant that a decrease in cytoplasmic basophilia of centrilobular cells was an obvious reaction in 3 species to several methods of liver injury. A similar hypobasophilia was produced in extracentral cells by treating sections with ribonuclease. Trichloroacetic acid removed all cytoplasmic basophilia and Feulgen-positive nuclear material.

Protective action of sulfa drugs against CCl_4 poisoning in mice. J. WALTER WILSON, ELIZABETH H. LEDUC AND LOIS E. ARNOLD (introduced by H. S. N. GREENE) *Dept. of Biology, Brown Univ., Providence, R. I.*

That the more soluble sulfa drugs, particularly sulfanilamide, protect rats against liver damage by CCl_4 was reported by Leach and Forbes (*Proc. Soc. Exper. Biol. & Med.*, 51: 47-48). We have investigated in mice the effect of sulfanilamide and also of sulfaguanidine and formosulphathiazole, which are poorly absorbed. Young adult mice were placed on a low fat (8%) or high fat (26%) semi-synthetic diet. Experimental animals received in the diet one of the following: 0.1% sulfanilamide, 0.5% sulfaguanidine, 2.0% sulfaguanidine, or 0.5% formosulphathiazole. After three days on the diet they were injected subcutaneously with 0.1 cc. of a 40% solution of CCl_4 in sesame oil. Animals were sacrificed on the second and third days afterward, and the livers studied histologically. Animals with CCl_4 but without sulfa drugs showed somewhat less liver injury on the low fat than on the high fat diet. From $\frac{1}{4}$ to $\frac{1}{2}$ of the lobule was necrotic. There was about the same injury with the formosulphathiazole. The 0.5% sulfaguanidine group showed very much less injury, and there was practically none in the 2.0% sulfaguanidine or the 0.1% sulfanilamide groups. In the sulfaguanidine groups, the only indication of CCl_4 poisoning was a reversible hydropic change in the liver cells, e.g. in the two day, 2% sulfaguanidine livers there were many "balloon cells", which had recovered by the third day. The protective action of these sulfa drugs seems to be related to the degree of absorption from the intestine.

Rate of clearance from blood of ^{131}I tagged plasma, determinations of cell and plasma volumes with radioisotopes and Evans blue. L. WISH,* R. H. STOREY* AND J. FURTH. *Oak Ridge Natl. Lab., Biology Division, Oak Ridge, Tenn.*

Rabbit and dog plasma were tagged with ^{131}I . The technique of Fine and Seligman was modified by removing the excess of unbound inorganic iodide by passage through an anion-exchange column. Seventeen rabbits were given a total body exposure of 1000 r of x-rays. Pairs of x-rayed and normal rabbits were injected intravenously with tagged homologous or heterologous plasma from 1-13 days after irradiation. Samples of blood were withdrawn at various intervals after injection and the relative activity of the ^{131}I in the plasma measured. Both homologous and heterologous plasma disappeared from the blood faster in the irradiated than in the normal rabbits. This difference was greater with homologous plasma. The highest concentration of radioactivity in the plasma, 3-5 minutes after injection, was taken to indicate the plasma volume. This volume, calculated in percentage of body weight, was less in animals that had been injected with homologous plasma, 4-13 days after irradiation, than in the normal rabbits. Evans blue plasma values determined on several of these animals were consistently higher than those obtained with iodinated plasma. ^{32}P tagged erythrocytes of the rabbits reintroduced in the animal likewise disappeared faster in irradiated than in normal animals. Experiments are being performed to obtain information on the meaning of these differences observed between x-rayed and normal rabbits.

Influence of estrogenic hormone on calcium and phosphorus balances in osteogenesis imperfecta congenita. HARRY H. WOMACK, JR.,* HILDA F. WIESE* AND ARILD E. HANSEN. *Dept. of Pediatrics, Univ. of Texas Med. Branch, Galveston.*

A 4-month old negro male infant with marked osteoporosis and bodily deformity due to numerous fractures because of osteogenesis imperfecta of the congenita type was studied. He was placed on a metabolic frame and given a weighed milk diet with vitamin supplements considered adequate to meet his fundamental nutritional requirements. The control period comprised two 3-day and two 6-day intervals for a total of 18 days, the separate urine and stool collections beginning after the patient had been on the experimental diet for over 2 weeks. The total calcium intake was 11.483 gm. and the output, urine 0.766 gm. and stool 8.439 gm.; the phosphorus intake was 8.542 gm. and the output, urine 2.603 gm. and stools 3.458 gm. Estrogenic substance, Progyon B (Schering) 1, ml. intramuscularly was given for

30 days, the diet and other conditions remaining unaltered. The calcium intake was 20.963 gm and the output, urine 0.499 and stool 15.865; the phosphorus intake was 15.779 gm and the output, urine 5.033 and stools 6.471. The average daily urinary calcium decreased following the administration of the estrogenic substance. However, average daily calcium retention was 0.154 gm for the control period and 0.153 for the estrogen period. Somewhat less phosphorus was retained during the administration of the estrogen, the daily average retention being 0.234 and 0.142 respectively for the control and estrogen periods. Roentgenograms revealed no change in the degree of osteoporosis. Estrogenic substance was continued for a short time thereafter without stool and urine collections. Fractures continued to occur with slight trauma.

Excretion and tissue distribution of C^{14} following intravenous injection of labeled plasma protein. C. L. YUILE, B. G. LAMSON,* L. B. ANDERSON, JR.* AND G. H. WHIPPLE. *Dept. of Pathology, Univ. of Rochester School of Medicine and Dentistry, Rochester, N. Y.*

Plasma with a high C^{14} content, from a donor

dog which had been fed DL-lysine labeled with C^{14} in the ϵ position, was collected at a time when at least 98% of the total plasma activity was present in the plasma proteins. Following intravenous injection of this labeled plasma into a recipient dog, the C^{14} content of aliquots of expired CO_2 was measured at intervals during a 48-hour period. A low and diminishing amount of the isotope was observed in these samples which indicated that not more than 6-7% of the dose was eliminated by this route during the period of the experiment. Urinary excretion accounted for loss of less than 1% of the injected C^{14} . The rate of decline of the plasma protein activity in the recipient dog confirmed the previously reported conclusion that plasma proteins are utilized and replaced at a minimum rate of 10%/24 hours. Following viviperfusion at 48 hours, significant amounts of activity, predominantly in protein, were detected in all tissues examined. The liver alone contained as much as 6.8% of the dose. The findings in this experiment are consistent with the theory of a rapid and labile exchange between plasma and tissue proteins, evolved from past metabolism studies.

AMERICAN INSTITUTE OF NUTRITION

Thirty-first Annual Meeting

ATLANTIC CITY, NEW JERSEY, APRIL 17-21, 1950

(An asterisk * following an author's name indicates "by invitation")

Riboflavin deficiency in dogs produced by 2-acetylaminofluorene JAMES B ALLISON AND ARTHUR W WASE * *Bureau of Biological Research, Rutgers Univ, New Brunswick, N J*

Feeding 0.03% 2 acetylaminofluorene in a synthetic diet to adult dogs produced a riboflavin deficiency which was characterized clinically by a seborrheic erythema with alopecia, a condition which was cured rapidly by increasing the riboflavin intake. Riboflavin retention tests demonstrated that the excretion of vitamin in the animals with lesions was greatly reduced below the controls. The riboflavin content of the livers of dogs with lesions was approximately 15 gamma per gram of tissue which is about half the amount found in the controls. The drug also reduced the riboflavin associated with the bacterial flora of the intestinal tract. A deficiency was not produced on a riboflavin-free diet in the absence of the drug. It was demonstrated that dogs fed the riboflavin-free diet had a normal riboflavin content of the feces and liver and that the retention of the vitamin was the same as in the controls. It was shown that the absorption of vitamin could be adequate from the region of the intestine where the bacteria were most abundant. These experiments indicate that a riboflavin deficiency can be prevented by the synthesis of vitamin in the bacterial flora of the intestinal tract and that 2-acetylaminofluorene will reduce the vitamin content of the bacterial culture in the feces as well as the content of the animal tissues. Continued feeding of the drug induced hepatomas in some and depletion of protein stores in all dogs.

A folic acid-derived growth factor for *Leuconostoc citrovorum* in human urine R M ANKER,* J W BOEHNE* AND ARNOLD D WELCH *Dept of Pharmacology, Western Reserve Univ School of Medicine, Cleveland, Ohio*

Urine contains a factor which stimulates the growth of *Leuconostoc citrovorum* 8081 under conditions where pteroylglutamic acid (PGA) does not itself cause growth of the organism. As noted by Sauberlich (*J Biol Chem* 181:467, 1949), administration of PGA greatly increases the urinary excretion of the citrovorum factor. In man, the effect of PGA on urinary excretion is subject to individual and daily variations which, in part, appear to be due to constituents of the diet, however,

the amount excreted remains roughly proportional to the amount of PGA ingested. Concentration of the factor from the urine of individuals ingesting 50-100 mg of PGA daily has been attained. Unmodified PGA is removed on Amberlite IR-4B without significant loss of activity for *L citrovorum*, while activity for *L casei* is greatly reduced. The factor behaves as an anion in alkaline media, is unionized at neutrality, is very unstable below pH 3, and is adsorbed strongly on Darco G-60 charcoal (pH 5-6) from which it is eluted by ammoniacal ethanol. Counter-current distribution, utilizing pyridine and aqueous sodium carbonate, yields a product with ultraviolet absorption suggesting the presence of a pteridine derivative. On paper strips, the factor in untreated urine moved but little with 2,4,6-collidine, with 2,4-lutidine either 2 or 3 zones of activity were obtained, while with butanol-acetic acid only one band resulted (with much loss of activity, as expected). The partially purified factor from urine gave but one band with 2,4-lutidine. Further studies on the concentration and properties of the factor are in progress.

Inactivation of biotin by hydrochloric acid A E AXELROD AND KLAUS HOFMANN *Inst of Pathology, Western Pennsylvania Hospital and Dept of Chemistry, Univ of Pittsburgh, Pittsburgh, Pa*

In the course of studies involving the utilization of different microorganisms for the assay of biotin in natural products, it was observed that hydrochloric acid extracts of grass juice powder possessed growth-promoting activity for *L arabinosus* and *S cerevisiae* but not for *L casei* and *S fecalis*. In contrast, sulfuric acid extracts of grass juice powder, as well as hydrochloric acid extracts of a large number of other natural products, were active for all 4 organisms. In attempts to elucidate the mechanism of the effect of hydrochloric acid upon grass juice powder the following observations were made: 1) Autoclaving of extremely dilute solutions of biotin with hydrochloric acid resulted in almost complete loss of their growth-promoting potency for *L casei* and *S fecalis* and approximately 50% loss for *L arabinosus* and *S cerevisiae*. Autoclaving with sulfuric acid was without deleterious effect. 2) Solutions of oxybiotin were not affected by autoclaving with either hydrochloric or sulfuric acid and 3) biotin sulfoxide was as ac-

tive as biotin for *L. arabinosus* and *S. cerevisiae* on a molar basis, and inactive for *L. casei* or *S. fecalis*. In view of the fact that biotin sulfone is inactive under these conditions for the 4 organisms, it is postulated that hydrochloric acid converts dilute solutions of biotin into a mixture of biotin sulfoxide and biotin sulfone. Experiments are presented which are in agreement with the concept that many natural materials are capable of preventing the conversion of biotin to its sulfoxide and sulfone through the action of hydrochloric acid. Such a 'protective' action is absent in grass juice powder.

Deposition of thiamine, riboflavin, and pantothenic acid in placental and fetal tissues as a basis for estimating vitamin requirements for normal reproduction in rats MARGARET BARRITT,* HARVEY LEWIS* AND GLADYS EVERSON *Nutrition Lab, Home Economics Section, Iowa Agricultural Exper. Station, Iowa State College, Ames*

Rats fed a modification of the Steenbock stock ration have been killed at intervals during pregnancy so that data could be secured on the quantity of vitamins present in fetal and placental tissues at any stage of pregnancy. Analyses for thiamine, riboflavin and pantothenic acid concentrations have been completed for such tissues. Since reproductive performance was known to be slightly more uniform among stock animals of our colony during second pregnancies, the second pregnancy was chosen for study. Females included in the present experiment, therefore, were known to have borne one satisfactory litter and were producing at least 9 young at the time they were killed. The concentrations of the vitamins of the uterus and its contents were determined for non-pregnant females and for rats in the 6th, 10th, 11th and 12th days of pregnancy. From the 13th day to parturition, animals were killed at one day intervals and both fetal and placental tissues were assayed. The results of this study bring out some interesting differences in the vitamin needs of the rat at various stages of pregnancy.

Effect of pyridoxine deprivation on amino acid metabolism in rats J. R. BEATON,* R. M. BALANTYNE,* R. E. LAU,* A. STECKLEY* AND E. W. MCHENRY *Dept. of Public Health Nutrition, Univ. of Toronto, Toronto, Canada*

To determine the relation of pyridoxine to amino acid metabolism, alanine was given intraperitoneally to fasting rats. At suitable intervals after administration of alanine, animals were killed to obtain blood for the estimation of urea, uric acid, glutamic acid, α amino nitrogen and sugar. Comparison was made between rats which had received pyridoxine and ones which had been deprived of that vitamin. The degree of deprivation was de-

termined by microbiological assay of liver stores of vitamin B₆. Pyridoxine insufficiency had no apparent effect on the production of urea, sugar, and glutamic acid after alanine administration, but there seemed to be delayed utilization of all of the metabolites studied. Blood concentration, as measured by packed cell volume, accounted for only a small proportion of the observed effects. The evidence indicated that pyridoxine deprivation, to the extent attained, did not interfere with the transamination of alanine to glutamic acid but did, possibly, delay deamination.

Influence of low levels of protein on heat production ALEX. BLACK, K. H. MADDY* AND R. W. SWIFT *Dept. of Animal Nutrition, Pennsylvania State College, State College, Pa.*

This study represents a continuation of previous on the same general subject (FORBES, et al. J. NUTRITION, 28: 189, 1944) in which it was found that the heat production of rats decreased with increased protein content of isocaloric diets. The protein content of the diets ranged from 10 to 45%. The experiment reported here was designed to include diets of lower protein content than were previously employed, namely, 6, 8, and 10%. All rations were compounded to be equicaloric and to contain approximately the same amount of vitamins and minerals. The experimental subjects were male weanling albino rats fed by the paired-method modified to include three littermate animals in a group, with one rat fed each level of protein studied. The heat production was measured by the body balance procedure involving analysis of control animals at the start of the experiment and the experimental subjects at the end. The average live weight of the three groups increased during 10 weeks from 48 grams at the start of the experiment to 123, 150, and 169 grams at the end for the 6, 8 and 10% protein groups respectively. Other data to be determined include metabolizable energy, nitrogen in the urine and feces, body gain of energy as protein and as fat and the heat production.

Toxicological studies of a new mercurial diuretic 8-(beta-acetoxymethyl-gamma-methoxypropyl)-3-carboxycoumarin-theophylline (EN-564) HAROLD BLUMBERG, ALBERT SCHLESINGER* AND S. M. GORDON* *Research Labs., Endo Products Inc., Richmond Hill, N. Y.*

A new mercurial diuretic, 8-(beta-acetoxymethyl-gamma-methoxypropyl)-3-carboxy-coumarin-theophylline, designated as EN-564, was synthesized in our laboratories. Clinical trials by Shapiro and Weiner have demonstrated that the intramuscular administration of EN-564 produces an effective and satisfactory diuresis in humans. In this compound the propyl group is attached to a ring carbon atom instead of to the carbamido

nitrogen of the currently available mercurial diuretics. Dissolved as the sodium salt at pH 7.3, EN-564 forms a stable solution containing 136 mg/cc of the compound, or 39 mg/cc Hg, which is the customary strength of mercurial diuretics for clinical use. The acute toxicity of EN-564 was determined in several species. The following values were found for the $LD_{50} \pm SE$, in mg Hg/kg intravenous—mouse 40.5 ± 1.7 , rat 9.8 ± 0.82 , rabbit 7.4 ± 1.4 , intramuscular—rat 12.3 ± 0.48 , rabbit 10.5 ± 1.0 , subcutaneous—mouse 83 ± 2.6 , oral—rat 238 ± 11 . These values, as well as those obtained for the estimated LD_{50} , indicate that EN-564 has approximately the same acute toxicity as the currently used mercurial diuretics. In a side-by-side comparison, the following values for the LD_{50} in rats were obtained: mersalyl-theophylline 10.8 ± 0.20 , EN-564 11.8 ± 0.17 . Similarly, a subcutaneous comparison in mice gave mersalyl-theophylline 74 ± 4.4 , meralluride 84 ± 2.1 , and EN-564 83 ± 2.6 . In a chronic toxicity study, young rabbits received weekly i.m. injections of EN-564 for 6 months. The rabbits tolerated the drug and gained weight at dosages as high as 8 mg Hg/kg/wk. This level corresponds to 0.20 cc/kg of the EN-564 solution, or approximately 5 times the clinical dosage.

Effect of dietary level of tocopherols on their metabolism in swine J. W. BRATZLER,* J. K. LOOSLI, V. N. KRAKOVSKY* AND L. A. MAYNARD
Depts. of Animal Husbandry, Dairy Industry, and Biochemistry and Nutrition, Cornell Univ., Ithaca, N. Y.

Five male weanling pigs were fed a tocopherol-low purified ration consisting of 25% casein, 40.3% starch, 25% corn sugar, 4% fiber, 0.2% methionine, 5% minerals, and liberal quantities of 9 vitamins. Two animals served as controls and the other 3 received supplements of mixed tocopherols in the form of a concentrate at the following levels in mg/100 lbs of live weight daily: 133.5, 2,500, and 5,000. All animals were slaughtered after 75 days on the experimental diet. Samples of whole blood, liver, heart, kidney, spleen, muscle and fat from 5 different storage sites were analyzed for their content of total and γ -plus δ -tocopherols using molecular distillation. Blood plasma was analyzed by the usual extraction procedure. Iodine and thiocyanogen values were determined on all samples of fat. With each increase in the level of tocopherols ingested, the tocopherol content of the tissues increased. The increases were most marked in the liver and body fats. Analyses of blood plasma and whole blood showed that the cells contained a much larger percentage of total tocopherols than the plasma. From the control animals zero values were obtained for blood plasma as contrasted with 197 μ g/100 ml of whole blood. Blood plasma to-

copherols reflected the levels ingested, but the increases were greater in the whole blood than in the plasma. Tocopherol supplementation affected markedly the fatty acid composition of the body fats by increasing the percentage of oleic acid at the expense of saturated fatty acids.

Lysine requirement for growing swine M. J. BRINEGAR,* H. H. WILLIAMS, J. K. LOOSLI AND L. A. MAYNARD
Depts. of Animal Husbandry and Biochemistry and Nutrition, Cornell Univ., Ithaca, N. Y.

L-lysine monohydrochloride was added to a diet containing sesame meal supplemented with methionine and histidine and fed to weanling pigs for 4 weeks. The basal diet consisting of 21.1% protein contained 0.57% lysine as determined microbiologically using *Leuconostoc mesenteroides*. Experimental diets were made to contain 0.57%, 0.75%, 0.97%, 1.07%, 1.17%, 1.32% and 1.63% pure L-lysine. These diets were distributed among 34 pigs. Daily feed intakes of the pigs were equalized weekly at approximately 5% of body weight. Each increased lysine level up to 1.17% improved the growth rate and feed efficiency. In another trial lysine was added to a 21.3% protein diet containing meat scraps, zein and wheat supplemented with methionine, histidine and tryptophan. Lysine levels of 0.96%, 1.00%, 1.20% and 1.40% were each fed to 5 pigs. Increases in growth rate and feed efficiency were noted up to the 1.20% lysine level. The data of these two experiments show that with diets containing approximately 22% protein (after lysine supplementation) weanling pigs require approximately 1.2% L-lysine in the ration. This is double a lysine requirement previously found by the same authors (*Federation Proc.* 8:379, 1949) when the protein level was only 10.6% furnished by linseed meal supplemented with methionine and histidine. In related amino acid studies it was shown that isoleucine is an essential component of swine rations. The addition of DL-allo-isoleucine to a 20.9% protein diet containing blood flour supplemented with methionine increased the rate and efficiency of gains of weanling pigs.

Vitamin C nutrition of the aged M. H. BROOKES, K. HEITSU* AND M. J. ALLEN*
Dept. of Home Economics, University of Chicago, Chicago, Ill.

The power of old people to use ascorbic acid efficiently has been questioned, but the data were incomplete because the usual food intakes of vitamin C, which preceded the tests, have been largely undetermined. In this study the ascorbic acid values of the food eaten for a 3-week test period, as well as the blood plasma levels of reduced ascorbic acid, were determined for 9 subjects, healthy old people, living in a home for the aged. The 3 men and 6 women studied ranged in age from 62-85

years, with an average age of 76 years. For 14 days the subjects ate their regular diet, which was self-selected, and for 5 days this was supplemented with 60 mg ascorbic acid from orange juice. The regular vitamin C intake, ranging from 29-76 mg between the subjects, had averaged 48 mg/day. The corresponding blood plasmas ranged from 0.27-0.51 mg/100 cc, with an average of 0.41 mg. The supplemented diets averaged 94 mg ascorbic acid and the subjects responded normally to this supplementation with a resulting plasma average of 0.54 mg reduced ascorbic acid/100 cc in 5 days.

Effect of some human-type diets upon growth and health of the laboratory rat ELIZABETH CROFTS CALLISON, ELSA ORENT-KEILES AND RACHEL UHVITS MAKOWER * *Bureau of Human Nutrition and Home Economics, U S D A, Beltsville, Md*

Five experimental diets, based on different food consumption patterns prevalent in the United States and composed of foods prepared as for human consumption, were assessed for their nutritive adequacy by feeding them to groups of laboratory rats from weaning to 500 days of age. Similar groups of rats were fed a stock ration for comparison. The diets were analyzed for their nutrient content. Growth, sexual maturity, ageing, and mortality were some of the physiological responses studied. The general physical condition of the experimental animals was also observed. The biological observations, as related to dietary composition, and the suitability of this type of experiment for the appraisal of human diets will be discussed.

Effect of rich, bulky, and poor diets on fertility in rats ANTON J. CARLSON AND FREDERICK HOELZEL *Dept of Physiology, Univ of Chicago, Chicago, Ill*

A comparative study was made of the effect of a rich diet, a bulky diet and a poor diet on the fertility of successive generations of early bred rats (littermates raised together) and later bred rats (segregated or isolated littermates mated when 130-230 days old). The rich and bulky diets were similar to diets used in our previous study (*J Nutrition* 36:27, 1948). The poor diet was a marginally adequate Sherman-type diet. In 30 months, 6-8 generations of inbred early bred rats were raised on each diet but the fertility of later bred rats was greatly impaired and apparently a cumulative impairment in successive generations prevented the raising of even 2 generations of inbred later bred rats on any diet. Ninety-eight male and 127 female early bred rats and 106 male and 150 female later bred rats were used. Fertility was least impaired in early and later bred rats on the bulky diet. This diet served to reduce the caloric intake of an otherwise rich diet. The results suggest that the low fertility of high grade live stock and the human upper classes is due to the use of

too much rich food and delayed procreation in successive generations.

Occurrence of dehydro-L-ascorbic and diketo-L-gulonic acid in the blood SHIH DZUNG CHEN* AND CECELIA SCHUCK *Nutrition Lab, Purdue University, Lafayette, Ind*

In an earlier study on the excretion of ascorbic acid with intake derived chiefly from crystalline ascorbic acid or from food sources the form found in the urine was largely L-ascorbic acid. However appreciable amounts of dehydro-L-ascorbic and diketo-L-gulonic acid were also detected. The quantities of the latter compounds excreted were rather constant for a given subject and appeared to be irrespective of intake. The question arose as to whether these compounds were excreted as such or whether as the result of incomplete protection of the reduced ascorbic from oxidation they might be formed during the 24-hour period of collection. Analysis of fresh samples of urine showed the presence of both dehydro and diketogulonic acid, with little change in amounts after the samples were preserved for 24 hours. The occurrence of these substances in freshly excreted urine suggested that they should be present at some time in the blood. Both were found in fasting blood samples in some instances and at intervals after the ingestion of crystalline ascorbic acid.

Role of B₁₂ on nitrogen retention of rats fed on soy bean protein diets at different caloric levels BACON F. CHOW AND LOIS BARROWS * *Dept of Biochemistry, School of Hygiene and Public Health, Johns Hopkins Univ, Baltimore, Md*

Supplementation of vitamin B₁₂ to soy bean protein diet accelerates the rate of growth of young rats, deficient of this vitamin. It is therefore of interest to ascertain whether B₁₂ enhances the efficiency of utilization of soy proteins. To this end, nitrogen balance experiments were performed to determine the amount of nitrogen retained by 2 groups of B₁₂ deficient rats, with and without supplementation of B₁₂. Their basal diet consisted of 40% sucrose and 60% Sobee, a commercial product containing 32% soy protein. Adequate vitamin supplement was also given. Urine and stool samples were collected weekly and analyzed for nitrogen, for a period of 6-8 weeks. It was found that when both groups of animals were given a restricted intake (6-8 gm of diet/rat/day), supplementation of vitamin B₁₂ did not increase the growth rate nor the retention of nitrogen. When the dietary allowance was increased by 50%, vitamin B₁₂ brought about a greater rate of growth but no better protein utilization. This is interesting since the added growth points to the effect of B₁₂ on carbohydrate or fat metabolism rather than protein metabolism. In another experiment the daily ration was further increased to *ad lib* feed-

ing The growth rate but not the efficiency of nitrogen utilization was increased by the addition of this vitamin These results therefore indicate that B₁₂ does not enhance the biological value of soy bean proteins under our experimental conditions but may play an important role in carbohydrate or fat metabolism

Effect of dietary restriction and rehabilitation on sodium, potassium and chloride of skin and total carcass of male rats RUTH CLAYTON AND ESTHER DACOSTA (introduced by CARL J KOEHN) *U S Army Med Nutrition Lab, Chicago, Ill*

The average sodium, potassium and chloride in mEq/kg of fresh weight for 14 control rats was 54.7, 30.2, and 24.0 respectively for the skin and 50.0, 52.1, and 19.0 respectively for the carcass. Of 80 rats restricted approximately 95 days, 14 on a low calorie diet had 54.7 mEq of sodium, 30.2 of potassium, and 23.4 of chloride in the skin and 52.0, 52.1, and 19.1 mEq respectively in the carcass. Eleven rats fed a modified carrot diet (2% protein) showed a 50% increase in the skin and carcass potassium. Rats fed a high salt, low protein diet had a 60% increase in both the potassium of the carcass and the chloride of the skin. Animals rehabilitated on a high protein or high carbohydrate diet showed a rapid rise in the potassium of the carcass and the chloride of the skin during the first 4 days of rehabilitation. Sodium in the skin rose to 144.9 mEq in rats on the high protein after the low calorie diet, and 143.9 on the high protein after the carrot diet. After one week of rehabilitation the skin sodiums were still definitely above the normal. The rats rehabilitated on high fat showed little deviation from the control during early rehabilitation.

Significance of vitamin B₁₂ in milk diets R. A. COLLINS,* L. S. DIETRICH* AND C. A. ELVEHJEM *Dept of Biochemistry, College of Agriculture, Univ of Wisconsin, Madison*

The inferior growth observed in rats fed goat's milk mineralized with iron, copper and manganese as compared to the good growth of rats fed mineralized cow's milk was studied. This inferior growth was counteracted by a daily addition to the mineralized goat's milk diet of 50 µg of folic acid plus 0.1 µg of vitamin B₁₂, 0.5 µg vitamin B₁₂ alone, or 1.0 gm of fresh beef liver. An inconsistent half maximal growth stimulation resulted when 50 µg of folic acid or 0.1 µg of vitamin B₁₂ was added separately to this diet. Goat's milk was found to contain only traces of vitamin B₁₂ in contrast to the occurrence of 2-3 µg of vitamin B₁₂ /l in cow's milk. The folic acid content of goat's milk was found to be very low and comparable to cow's milk. Folic acid or vitamin B₁₂ additions to mineralized cow's milk diets did not affect growth in

the young rat. The addition of vitamin C to the cow's milk diets produced a large increase in the vitamin B₁₂ content of the livers, while on the goat's milk diets added vitamin C displayed no activity. Folic acid and vitamin B₁₂ additions to mineralized cow's milk or goat's milk did not affect the rate of hemoglobin formation in the weanling rat or in rats made anemic on milk diets.

Vitamin B₁₂ content of chick tissues as influenced by diet J. R. COUCH, ORLANDO OLCESE AND H. L. GERMAN (introduced by L. R. RICHARDSON) *Depts of Biochemistry and Nutrition and Poultry Husbandry, Agricultural and Mechanical College of Texas, College Station*

New Hampshire chicks from hens fed an adequate ration were used in these tests and were maintained in batteries with raised screen floors. A vitamin B₁₂ low basal diet which contained 35% soybean oil meal was fed to the first group. A 2nd group received a supplement of approximately 20 µg of B₁₂/kg of diet. Supplementing with vitamin B₁₂ increased the B₁₂ content of the liver about 5 times, of the kidney, approximately 2 times, of the pancreas, slightly, and of the spleen, none. The chicks which received B₁₂ averaged 280.4 gm more at 10 weeks than those which did not receive it. In the same series, 10% of dehydrated alfalfa leaf was substituted for an equivalent amount of corn. The ration containing alfalfa was supplemented with 0, 20 and 130 µg of vitamin B₁₂/kg of diet, respectively. The alfalfa appeared to inhibit the growth of the chicks even when the diet was supplemented with the large amount of B₁₂. The alfalfa tended to decrease the B₁₂ content of the tissues below that of comparable groups not fed alfalfa. However, the tissues contained larger amounts of vitamin B₁₂ when the alfalfa diet was supplemented with 130 µg of B₁₂ than when it was supplemented with the lower level or with no vitamin B₁₂. Vitamin B₁₂ content of the tissues was determined with *Lactobacillus leichmanni* 4797 (ATCC). Thiomalic acid was used as a reducing agent in the media.

Quantitative estimation of effect of rutin on biological potency of vitamin C EARLE W. CRAMPTON AND LEWIS E. LLOYD* *Dept of Nutrition, Macdonald College, P. O., (McGill University), Quebec, Canada*

Considerable evidence has been advanced in the literature that rutin, and other vitamin P-active materials, carry out their physiological function as antioxidants. The beneficial effect of some of these materials on vitamin C has been shown, but the results have been of a qualitative nature. This study, involving the administration of vitamin C to 128 guinea pigs, was designed to determine the extent to which rutin enhanced the apparent biological value of ascorbic acid. The odontoblast

method of vitamin C bioassay was used. Rutin increased the apparent biological value of ascorbic acid by approximately 50%, when the vitamin was supplied in sub-maximum amounts, either in crystalline form or from a natural source. As the level of ascorbic acid intake approached that which without rutin will permit normal tooth development, the beneficial effect of added rutin was negligible. These results could be explained by the assumption that rutin prevented *in vivo* oxidative destruction of the administered ascorbic acid.

Effect of dietary restriction and rehabilitation on weight of adrenal gland of male albino rat

ESTHER DaCOSTA and RUTH CLAYTON (introduced by CARL J KOEHN) *U S Army Med Nutrition Lab, Chicago, Ill*

Weights of the adrenal glands of 340 male albino rats were determined after 3 types of dietary restriction (low calorie, modified carrot, and high salt-low protein) and 3 types of dietary rehabilitation (high protein, high fat, and high carbohydrate) following each type of restriction. The average weight of the adrenals of 54 control rats was 75 mg, of 24 rats on the low calorie diet, 66 mg, of 24 rats on the carrot diet, 49.5 mg, and of 24 rats on the high salt diet, 44.5 mg. On an organ/body weight basis instead of the absolute weight, a significant increase was found during restriction, particularly in the group fed the low calorie diet. During the first 4 days of rehabilitation, absolute adrenal weights and adrenal/body weight ratios increased in all rats to values exceeding those of the controls and even after 97 days of rehabilitation only the adrenal weights of the rats rehabilitated on the high carbohydrate diet had declined below that of the controls. In these rats, the average adrenal/body weight ratio was 15.2 as compared to a ratio of 18.7 for the control. The difference in adrenal weight response to different rehabilitation diets may indicate the beneficial value of high protein or high fat as compared to high carbohydrate in rehabilitation therapy.

Metabolism of cobalt 56 in the hen's ovary

H H DARBY (introduced by E M NELSON) *Carnegie Inst of Washington, Dept of Terrestrial Magnetism, Washington, D C*

With the publication of the fact that cobalt is incorporated in vitamin B₁₂ and that B₁₂ is found in the droppings of chickens, it became of interest to study the fate of cobalt fed to hens. It had already been shown that increased growth could be obtained by injecting small amounts of B₁₂ into developing eggs. This would lead one to believe that there was a shortage of B₁₂ in the average hen's diet. Cobalt 56 was fed in pellet form to 2 hens and the eggs collected for some 3 weeks thereafter. The eggs were tested as a whole first for

radioactivity and then they were separated into shell, albumen, and yolk. The amount of cobalt in each fraction was ascertained. The shell and the albumen followed a typical excretory pattern. There was a rise of radioactive cobalt in the shell and the albumen on the 4th-5th day, followed by a fall to almost zero by the 10th day. The rise of radioactive cobalt in the yolk, however, was somewhat slower and although there was a high level for some 10 days, no fall of cobalt was found similar to that in the albumen and the shell. It leads one to believe that the yolk of the egg follows a different pattern of metabolism than does that of the shell and the albumen. From these experiments it seems that cobalt once laid down in the yolk is retained in these formative eggs.

Excretion studies of biotin in urine and feces of normal and protein-depleted rats

ROBERT L DAVIS* and BACON F CHOW *Dept of Biochemistry, School of Hygiene and Public Health of Johns Hopkins Univ, Baltimore, Md*

Biotin requirements of rats can be met by bacterial synthesis in the intestinal tract. This investigation deals with the effect of dietary proteins on this bacterial synthesis of biotin as reflected by its excretion. Male adult rats, which were protein-depleted as evidenced by blood protein concentration and weight loss, were placed in metabolism cages as were casein diet controls. Urine and feces, collected every 4 days, were assayed for free biotin using *Lactobacillus arabinosus* 17-5. Throughout this experiment, both groups received a biotin-free vitamin supplement. Fecal results were also expressed in mg biotin/gram wet feces. Some differences were noted re-

COLLECTION PERIOD	BIOTIN GIVEN	MODE OF ADMIN
1st (Baseline)	none	Intramuscular
2nd	10 mg every 4 days	
3rd	10 mg every 4 days	Oral
4th (Baseline)	none	

garding urinary and fecal excretion of biotin in the protein-depleted and normal rats when this vitamin was withheld or the mode of administration varied. 1) Urinary and fecal biotin was greater in the casein diet rats during the initial baseline period. 2) The administration of biotin either *im* or orally resulted in no marked difference in the urinary excretion of this vitamin between the two groups. 3) When biotin was given orally, fecal biotin was considerably higher in the protein-depleted rats. 4) During the final baseline, urinary and fecal biotin was about equal in both groups.

Methionine deficiency by force-feeding J N WILLIAMS, JR,* A E DENTON,* FUNG-HAAN FUNG* AND C A ELVEHJEM *Dept of Biochemistry, College of Agriculture, Univ of Wisconsin, Madison*

In the course of investigations concerning the effects of a methionine deficiency upon general metabolism of the young growing rat, a force-feeding procedure was undertaken. One group of rats was force-fed a complete ration in which protein was supplied as an amino acid mixture. Another group was force-fed the same ration in the same amounts except that methionine was omitted. Nitrogen balance of the 2 groups of animals was determined. The animals of all groups receiving the complete ration gained weight and remained in strongly positive nitrogen balance. The rats force-fed the methionine-free ration for up to 3 weeks retained the same weight and remained in strongly positive nitrogen balance throughout the period. Moreover, they showed no tendency to go into negative nitrogen balance. The methionine-deficient group, however, exhibited some striking differences from the control group in other respects: bleeding of the feet and around the mouth, fatty livers, and very low liver xanthine oxidase activity.

Inhibition of chick bone marrow choline oxidase by aminopterin in vivo JAMES S DINNING,* CECILIA K KEITH* AND PAUL L DAY *Dept of Biochemistry, Univ of Arkansas School of Medicine, Little Rock*

A study was made of the effects of aminopterin on adult chick bone marrow cell counts, peripheral blood counts, and on the oxygen consumption of marrow cell suspensions. After 6 daily injections of 1 mg of aminopterin the tibia and femur marrow cell counts were reduced to 11% of control values, blood leucocyte counts to 18% of control values, and red cell counts to 63% of control values. Marrow cell suspensions from aminopterin treated chicks consumed an average of $11.5 \mu\text{l O}_2/10^8$ cells/hr, similar preparations from control chicks consumed an average of $5.4 \mu\text{l O}_2/10^8$ cells/hr. The addition of choline to cell suspensions from control chick bone marrow increased oxygen consumption 28% while the addition of choline to cell suspensions from aminopterin treated chick bone marrow depressed oxygen consumption 18%. The addition of sodium succinate to cell suspensions from control and aminopterin treated chick bone marrow increased oxygen consumption 22% and 21% respectively. These data suggest that normal chick bone marrow exhibits choline oxidase activity and that the choline oxidase activity is completely inhibited by aminopterin. Barron *et al* (*J Exper Med* 87: 489, 1948) have shown that the nitrogen mustards, which produce a

leucopenia, strongly inhibit oxidase, and we have found that urethane, another substance which lowers white cell count, inhibits choline oxidase *in vitro*. In view of these findings it is suggested that the choline oxidase enzyme system plays a significant role in blood cell formation.

Metabolism of ascorbic acid in rats I Influence of age and diet DOROTHY A EHMEKE,* BESSIE L DAVEY* AND E NEIGE TODHUNTER *Research Lab of Human Nutrition, Univ of Alabama, University*

Earlier studies showed plasma and whole blood levels of ascorbic acid in mature rats were higher for males than females (*J Nutrition* 31: 573, 1946). The present study was undertaken in an attempt to determine the cause of the difference. Groups of rats were analyzed at 1) 63 days and 2) 112 days of age. Each age group was subdivided and received for 3 weeks prior to analysis one of the following diets: a) stock diet of laboratory checkers, containing some vitamin C, b) synthetic vitamin-C free diet, c) stock diet plus 50 mg ascorbic acid daily. There were approximately 10 rats of each sex in each diet group within each age group. Analyses for ascorbic acid were made in plasma, whole blood and white cell-platelet fraction, hematocrit and hemoglobin were also determined. The following organs were analyzed: liver, adrenals, kidneys, ovaries and testes. 24-hour urine collections were made for 3 days immediately prior to death of the animals. Maturity does not appear to be a determining factor in ascorbic acid in blood. Plasma, whole blood and white cell-platelet values were lower for these young females than for males. Intakes of 50 mg ascorbic acid daily caused no increase in blood ascorbic acid and apparently no increase in the organ stores. Urinary excretion of ascorbic acid increased when ascorbic acid was administered, but not in proportion to the amount fed. The same factors are being studied in senile rats.

Regression of lymphosarcoma transplants following the administration of cortisone to riboflavin-deficient mice GLADYS A EMERSON, ELIZABETH WURTZ AND MARY E ZANETTI* *Merck Inst for Therapeutic Research, Rahway, N J*

Heilman and Kendall reported that the administration of compound E (cortisone) to mice with lymphosarcoma transplants resulted in a regression of tumor tissue; however, the tumors recurred following withdrawal of the drug and the animals succumbed despite the resumption of therapy. Stoerk and Emerson observed a regression of lymphosarcoma transplants in riboflavin-deficient mice; furthermore animals so treated were refractory to subsequent transplants. Therapy with cortisone superimposed upon riboflavin avitaminosis might be expected to bring about a sup-

pression of tumor growth with minimal injury to the host. Accordingly cortisone and other adrenocorticosteroids were administered to mice with well established (13 to 16-day post-inoculation) lymphosarcoma transplants. The animals were maintained on either riboflavin-deficient or natural food rations. A rapid regression of tumor tissue occurred in mice receiving 500 μ g of cortisone daily in conjunction with a riboflavin-deficient diet. The tumors were non-palpable following 4 days of treatment while the transplants of controls (deficient in riboflavin) were still apparent at 10 days. When the same level of cortisone was given to mice fed a stock diet only a transient retardation of tumor growth occurred and the animals succumbed despite continuous treatment. ACTH (500 μ U) when given in divided dosage (twice daily) to mice maintained on the riboflavin-deficient diet, failed to enhance the effect of the avitaminosis upon tumor growth. A regression of transplants was not observed following daily administration of 500 μ g of Compound S acetate or of 500 μ g of desoxycorticosterone acetate.

Influence of dietary protein on tumor production by 2-acetylaminofluorene R. W. ENGEL *Lab of Animal Nutrition, Alabama Polytechnic Inst, Auburn, Ala*

Weanling female rats of the AES strain were fed a basal diet containing 03% 2-acetylaminofluorene. The diet consisted of corn grits 20, salts 4, lard 15, cod liver oil 1, water-extracted casein 9, l-cystine 0.3, sucrose 50.7 and was supplemented with adequate amounts of thiamine, riboflavin, pyridoxine, pantothenate, choline, inositol, niacin and alpha-tocopherol. This diet consistently produced mammary tumors in an average of 20 weeks if the body weight was 165 gm or more at 16 weeks. When body weight was less than 165 gm as a result of voluntary food restriction the mammary tumor incidence was only 25%, the remainder of the animals dying with face or liver tumors in 24-30 weeks. Increasing the dietary casein to 20% assured the attainment of body weights of 165 gm or more in 16 weeks and resulted in the consistent appearance of mammary tumors. When the casein was increased to 40% body weights averaged 185 gm in 16 weeks and 50% of the animals had not developed external tumors at 32 weeks while 25% had mammary tumors and 25% had face tumors. When the casein in the diet was increased to 60% body weight gains averaged 165 gm in 16 weeks but all animals were still tumor-free after 33 weeks at which time all control animals had died with mammary or face tumors.

Failure of folic acid or xanthopterin to replace thiamine in mice and rats maintained on thiamine-deficient diet ALBERT J. EUSEBI* AND

LEOPOLD R. CERECEDO *Dept of Biochemistry, Fordham Univ, New York City*

The relationship between thiamine and certain pterins, particularly folic acid and xanthopterin, studied by Busnel and co-workers (*Compt rend Soc de biol* 224:237, 1947) in pigeons, was investigated in mice and rats. The basal diet consisted of purified casein, 25%, sucrose, 53, Crisco, 10, lard, 5, salts, 5, and Ruffex, 2. The following supplements were added/kg of diet: pyridoxin, 10 mg; riboflavin, 10 mg; calcium pantothenate, 100 mg; alpha-tocopherol, 40 mg; beta-carotene, 20 mg; choline 1.5 g; and vitamin D 5000 IU. Swiss, Rockland and Fordham mice were used. Folic acid was administered orally by incorporation in the diet at a level of 20 mg/kg, or by subcutaneous injection at a level of 50 γ /day. Young mice were placed on the thiamine deficient diet until depleted. At this time the experimental group received folic acid orally or by injection, and the controls maintained on the deficient diet. Ten control mice survived for periods of 23-30 days. Sixteen mice receiving folic acid survived from 17-31 days. Further, the weights of the animals receiving folic acid ran parallel to those of the controls. Once the mice were deficient in thiamine, folic acid failed to restore the appetite or the body weights. These results were confirmed with young Sherman rats to which both folic acid and xanthopterin were administered. As in the case of the mouse, these pterins failed to exhibit any 'thiamine-like activity' in the rat.

Human digestibility studies suggesting unexpected limitations in use of certain common foods as sources of riboflavin GLADYS EVERSON, ELINOR PEARSON* AND ROBERTA MATTESON* *Nutrition Lab, Home Economics Section, Iowa Agricultural Experiment Station, Iowa State College, Ames, U S Bureau of Human Nutrition and Home Economics*

During earlier studies concerned with the apparent availability of the riboflavin of green peas, ice cream, soybeans and almonds, we observed significant differences in the urinary excretion of riboflavin when one mg quantities of this vitamin were supplied from the above food sources. These findings have led us to investigate the degree to which these foods are digested by young adult women. Nitrogen, crude fiber, fat and heat of combustion values have been determined on the feces of 4 young adult women tested during a series of five 9-day metabolism experiments. Each test food has been incorporated into an adequate mixed diet so that the subjects consumed 2 average serving portions of the food/day. The basal diet was adjusted from one test period to another so that the total intake contributed the same dry food weight daily. The results of these studies have revealed surprisingly large fecal losses of

calories and fat. Nitrogen losses have been increased when certain of the test foods were consumed. We believe these differences in digestibility explain in the main the variations in urinary riboflavin noted during our past experiments and that incomplete digestion of certain of these foods has caused them to be of reduced value as sources of riboflavin.

Studies on fat deposition and nitrogen metabolism in four strains of mice PAUL F. FENTON AND CLAIRE J. CARR * *Dept. of Biology, Brown Univ., Providence, R. I.*

Earlier investigations have suggested the possibility that rations could be devised which might be ingested by the mouse in quantities sufficient to lead to obesity. Body weight gains were determined in 4 strains of mice (C57, I, A and C3H) fed highly purified rations differing in the amount of protein, fat and carbohydrate. Increasing the fat content of the diet above 5% resulted in greater weight gain. Mice fed a diet containing 90% casein grew more slowly than mice fed a ration containing only 30% casein. When lactalbumin was used at the 90% level, growth was better than with 90% casein. In each case the nature of the weight gain was studied by carcass analysis for water, protein and fat. Making use of the diet which so far has given the most rapid weight gain, the four strains of mice were compared with respect to the efficiency of food utilization for growth. The weight gain per gram of food consumed was greater for the C57 than for the other three strains. Nitrogen metabolism has been studied in the 4 strains of mice by two methods: a) by determining the body weight gain per gram of nitrogen ingested (making use of a 10% protein diet), and b) by measuring nitrogen balance. The latter was accomplished by feeding a nearly nitrogen-free diet, administering different amounts of nitrogen by stomach tube after a suitable period of depletion, and determining the fecal and urinary nitrogen.

Use of the mealworm, *Tenebrio molitor*, in nutritional studies G. FRAENKEL *Dept. of Entomology, Univ. of Illinois, Urbana*

The technique of using mealworms as subjects in nutrition research is described in detail. Valid and repeatable results can only be obtained if the temperature and relative humidity of the culture room are rigidly controlled. At 25° C and 70% relative humidity, on an optimal diet, larvae grow from 0.5 mg to 120–150 mg during a period of 2½ to 3 months, but during the period of fastest growth, between 10 and 100 mg, weight is nearly doubled every week. The rate of growth varies greatly with the water content of the food, being fastest when in equilibrium with 70–80% R.H., and virtually at a standstill at 13% R.H. *Tenebrio* requires 80–85% of a carbohydrate in the diet, the

requirements being equally satisfied with glucose or starch, also a suitable sterol, but no fat or fat soluble vitamins. Of proteins casein, lactalbumin, peanut protein or edestin give optimal effects, soy bean protein is of moderate value, and only after extensive heating, zein or gliadin fail to support growth, the deficiencies being only partly rectified by the addition of lysine and tryptophane. On wheat flour, even from whole wheat, growth is very slow, on account of a partial riboflavin deficiency. *Tenebrio* requires the following vitamins of the B complex, minimum optimal amounts, expressed as µg/gm of the dry diet, being given in () —thiamin (1), riboflavin (2–8), nicotinic acid (16), pyridoxin (2), pantothenic acid (8), biotin (0.16), pteroylglutamic acid (0.12) and choline (300).

Importance of time factor upon utilization of amino acids in 'maintenance' of adult rats E. GEIGER AND E. B. HAGERTY (introduced by HARRY J. DEUEL) *Dept. of Pharmacology, Univ. of Southern California Med. School, Los Angeles, and Van Camp Seafood Co., Terminal Island, Calif.*

It has been shown earlier that growth of infantile rats occurs only if all the essential amino acids are supplied simultaneously (*J. Nutrition* 34:97). Cannon (*Federation Proc.* 6:390) has similar results investigating the repletion of protein-depleted adult rats. The repletion, i.e. repair of lost tissue, is however essentially equivalent to protein formation in growth. We have investigated the possibility that there are some basic differences regarding the time factor in the utilization of amino acids for 'maintenance' as compared with growth. Twelve adult rats were kept for 12 hours on a diet containing a tryptophan free amino acid mixture, the missing amino acid was supplied 12 hours later. In one control group the diet did not contain any amino acids, these rats lost weight progressively. In the other control group the acid hydrolysate (casein) and the tryptophan supplement have been fed simultaneously. These rats maintained their weight. To assure a satisfactory intake of the amino acids, the tryptophan free mixture as well as the tryptophan supplement, were force-fed to the paired animals. Adult rats receiving tryptophan as a delayed supplement for 21 days lost weight as fast or faster than those kept on an amino acid free diet. This indicates that 'maintenance', similar to growth, requires the simultaneous presence of all essential amino acids, i.e. the aging protein cannot be mended by a 'piece-by-piece' replacement of the individual amino acids. On force feeding of the tryptophan free amino acid mixture, the animals' appetites deteriorated progressively, indicating the damaging action (Allison, Elvehjem) of 'incomplete' mixtures.

Acetylation of PABA and of sulfadiazine by human subjects HERBERT GERSHBERG,* W JAMES KUHLE* AND ELAINE P RALLI *Labs of the Department of Medicine, New York Univ College of Medicine, New York City*

Acetylation of orally administered PABA and intravenously administered sulfadiazine was measured over a period of 7 months. The free and acetylated form of the compounds excreted in the urine was determined by the method of Bratton and Marshall. Results are expressed as the percentage acetylated of the amount recovered. In normal subjects acetylation remained fairly constant during the period studied. The percentage of PABA acetylated decreased as the dose administered increased. When the dose of PABA was 100 mg, 90% was acetylated. As the dose increased to 500 mg, the percentage acetylated decreased slightly. With doses from 500 to 800 mg sharper decline in acetylation occurred, with doses of 800 to 1700 mg, acetylation decreased further to 55%. Calculated on the basis of body weight, the sharpest decline in percentage acetylated occurred with doses from 6-10 mg/kg, and remained fairly constant up to 20 mg/kg. Administration of large amounts of pantothenic acid (10 gm daily) did not alter acetylation of PABA or sulfadiazine. Acetylation studies were done in 6 patients with cirrhosis of the liver, and 2 patients with adrenal insufficiency. The capacity of these patients to acetylate PABA fell within the normal range. Apparently in human subjects acetylation occurs principally in the tissues, and neither the liver nor the adrenal cortex are significantly involved. In patients with hyperthyroidism, however, acetylation was decreased, and the administration of thyroid to hypothyroid individuals decreased their capacity to acetylate.

Nutritional requirements of syrian hamster for growth HUMBERTO GRANADOS* AND HENRIK DAM *Dept of Biology, Polytechnic Inst, Copenhagen, Denmark*

They contain an unrecognized growth factor (s) for hamsters (GRANADOS, GLAVIND AND DAM *Nordisk Mejeri-Tidsskrift* 12: 237, 1946). The published studies on the need for growth by hamsters of dietary biotin, choline, inositol, niacin, and p-aminobenzoic acid are contradictory (SCHWEIGERT *Vitamins and Hormones* 6: 55, 1948). Two experiments with newly weaned hamsters were carried out using a basal diet containing 4% salts, 25% casein, 63.5% sucrose, and 7% lard. First experiment *group I* (control) received all chemically known vitamins in abundance. *Groups II, III, and IV* were deprived of choline, inositol or biotin, respectively. Average weight gains, in gm, during 49 days: *I*, 44, *II*, 39, *III*, 44, and *IV*, 42. Second experiment *groups V* and *V-a*

(controls) received vitamins as *group I*. *Groups VI, VII, VIII, and IX* and *IX-a* were deprived of p-aminobenzoic acid, niacin, folic acid or vitamin K, respectively. Average weight gains, in gm, during 63 days: *group V*, 56, *VI*, 53, *VII*, 57, *VIII*, 57, and *IX*, 53. The prothrombin times of blood taken at the 4th, 5th, 6th and 7th weeks were essentially the same for *groups V-a* (control) and *IX-a* (fed no vitamin K). At autopsy none of the hamsters from *groups IX* and *IX-a* exhibited hemorrhages. Thus these studies show that hamsters grow somewhat better with dietary choline, but that they do not require dietary inositol, biotin, p-aminobenzoic acid, niacin, folic acid or vitamin K for growth. Since the hamsters fed the vitamin K-free diet neither grew slower nor developed hypoprothrombinemia or hemorrhages, these results are at variance with what Hamilton and Hogan have reported, i.e., that hamsters require dietary vitamin K (*J Nutrition* 27: 213, 1944).

Interrelation of linolenate and linoleate in growth studies on rats SAMUEL M GREENBERG,* CLARENCE M CALBERT,* EVELYN E SAVAGE* AND HARRY J DEUEL, JR *Dept of Biochemistry and Nutrition, Univ of Southern California, Los Angeles*

Weanling rats were placed on fat-free diets until essential fatty deficiency was established by growth failure. The depleted rats were then divided into the following groups each consisting of 5 males and 5 females: (1) Positive controls (30% cottonseed oil diet), fat-free diets with the following daily supplements: (2) negative control (ethyl laurate), methyl linoleate in (3) 5 mg (4) 10 mg, (5) 20 mg, (6) 50 mg, methyl linolenate in (7) 10 mg, (8) 5 mg plus 5 mg linoleate and (9) 10 mg plus 10 mg linoleate. With male rats the curve for weight gain vs log-dose over a 11-week period was a straight line function. By extrapolation to the growth attained in (1), optimum level of linoleate was estimated at 100 mg daily. With female rats, optimum level of linoleate was found to be 20 mg and some growth depression results at 50 mg intake. Superior growth on fat diet in *group 1* could not be obtained with linoleate in females. Linolenate alone (7) gave only slight growth stimulus but when combined with linoleate (9) gave identical growth with equivalent dose of linoleate (5). Results of males on (8) were somewhat less than on (4). Male and female rats on (2) lost weight during the test. It is concluded that the utilization of linolenate for growth depends on the concomitant administration of linoleate and that a sex difference in utilization of essential acids obtains. In female rats fat has growth effect not attributable to linoleate.

Iodine in Nutrition

ISIDOR GREENWALD *Dept of Chemistry, New York Univ College of Medicine, New York City*

A recent review (*J A M A* 139 28, 1949) claimed that goiter in Yunnan, China was due to the cessation of the previous supply of salt from the coastal provinces, due to the Japanese occupation. As is well attested by the literature, goiter has been prevalent in Yunnan since before 1867, salt from the coastal provinces was not rich in iodine and, moreover, never or rarely reached Yunnan. The same review stated, "Baumann and Roos and also Oswald were the first to observe that if iodine is withheld compensatory hypertrophy of the thyroid occurs." There is nothing about withholding iodine in the papers cited. Both state that the concentration of iodine in the thyroids from goitrous regions was less than in those from non-goitrous districts but Oswald emphasized that the iodine content was greater in the thyroids from goitrous regions than in those from places in which goiter was less prevalent and that the total iodine was greater in goiters than in normal glands from the same districts. No one has yet demonstrated enlargement of the thyroid in animals on an iodine-poor diet of purified constituents. Enlargements have been produced with diets that must be considered to have contained goitrogenic agents. Presumably, iodine is a dietary essential but there is no accurate information regarding the amounts needed for maintenance or the effects of withdrawal.

Influence of previous diet on metabolism of rat diaphragm

R G HANSEN,* W J RUTTER* AND L T SAMUELS *Dept of Biological Chemistry, Univ of Utah College of Medicine, Salt Lake City*

Diaphragms from rats under different nutritive conditions were incubated in glucose buffer in the presence of O₂, and the changes in glucose, pyruvate and lactate were determined. If the rats had been fed a high fat diet, the diaphragms used less glucose and accumulated more pyruvate and lactate than diaphragms of carbohydrate-fed rats. If insulin was added glucose uptake and glycogen storage were increased in all diaphragms, but proportionately to the rate without insulin. The effect of fat-feeding, therefore, could not be explained on the basis of a difference in insulin content. Since there was no significant difference in O₂ uptake between the different groups, the evidence here would indicate the inflow of substrate into the oxidative cycle beyond pyruvate in the case of the fat fed rats.

Effect of surface active agents when fed in diets of rats

ROBERT S HARRIS, HENRY SHERMAN* AND WALTER W JETTER *Massachusetts Inst of Technology and Boston Univ School of Medicine, Boston, Mass*

Sorbitan monolaurate (SL), polyoxyethylene sorbitan monolaurate (PSL), polyoxyethylene monolaurate (PL), polyoxyethylene monostearate (PS) and hydrogenated oil (HO) were fed as 25% of 2 experimental diets to groups of 14 and 30 weanling rats for 60 and 70 days, respectively. *Diet I* contained casein 18, sucrose 52.7, salt mixture 4, vitamin mixture (vitamin B₁, B₂, B₆, A and D, niacin, pyridoxine, Ca pantothenate choline) 0.3 and test substance 25. *Diet II* contained casein 27, sucrose 40.5, salt mixture 4, liver extract (1:20) 1, corn oil 1, celluloflour 1, and vitamin mixture (same vitamins as diet I plus E, C, inositol, PGA, biotin, PABA) 0.5, and test substance 25. Results on *diet I* tabulated below. *Diet SL* produced nasal hemorrhage, gangrenous tails and legs, PSL and PL caused severe diarrhea, PL produced extensive bladder stones. *Diet II* produced similar results. Paired feeding of one HO group with SL group indicated SL results not due to starvation. Extra group fed 12.5% HO plus 12.5% Celluloflour indicated results not due to inert material in test compounds. Organ tissues from groups on *diet II* were studied histologically, results will be reported. The results indicate that SL, PL and PSL are toxic to rats when fed as 25% of nutritionally complete diet.

TEST COMPOUND	SL	PSL	PL	PS	HO
Wt increase (gm)	-19	45	74	88	193
Wt incr/gm diet	—	10	11	15	28
Mortality (%)	70	36	0	0	0

Comparison of the 2,6-dichlorophenolindophenol and 2,4-dinitrophenylhydrazine methods with the Crampton bioassay for determining vitamin C values in foods

ELIZABETH M HEWSTON,* MURRAY FISHER* AND ELSA ORENT-KEILES *Bureau of Human Nutrition and Home Economics, U S D A, Beltsville, Md*

The application of chemical methods to the measurement of ascorbic acid in foods, especially those processed or stored, is often complicated by the presence of interfering substances. The most troublesome of these are the reductones and diketogulonic acid which react like ascorbic acid with two commonly used reagents, 2,6-dichlorophenolindophenol and 2,4-dinitrophenylhydrazine. Since these substances are biologically inactive, the vitamin C values obtained are falsely high. To determine the specificity of the 2,6 dichlorophenolindophenol and 2,4-dinitrophenylhydrazine methods when interfering substances are present, comparison was made of the vitamin C values obtained by these two chemical procedures with those obtained by bioassay employing omdotoblast length as the criterion. Canned foods before and after storage at several temperatures were used. Diketogulonic acid does not interfere with the indophenol reaction and reductones could be

differentiated Correction of the phenylhydrazine method for diketogulonic acid and partial correction for reductones was possible Thus, suitable corrections for interfering substances could be made with the indophenol method, but not always with the phenylhydrazine method The extent of interference, methods of correction, and agreement of both methods with the biologically determined values will be reported

Role of fat in protein metabolism CECILE HOOVER* AND PEARL SWANSON *Nutrition Lab , Iowa Agricultural Experiment Station, Iowa State College, Ames*

It has been demonstrated previously in this laboratory that protein metabolism in a rat partially depleted of its reserves of nitrogen is affected not only by the energy intake of the animal but also by the source of calories in the low-nitrogen ration Omission of fat from this diet results in a doubling of the rate of protein catabolism when the caloric intake is restricted to 25% of the normal ingestion Supplementary methionine prevents this effect Extension of the study has provided data that give some insight into the mechanisms underlying the regulatory effect of fat and methionine on protein metabolism Evidence is based on studies showing the respective concentrations of moisture, nitrogen, fat, and riboflavin in the liver, and changes in the distribution of amino nitrogen and urea in the blood of rats under the dietary conditions imposed in the experiment That fat under conditions of stress may provide building blocks for certain enzyme systems is indicated

Relation of vitamin B₁₂ to vitamin E in nutrition of young rats E L HOVE AND J O HARDIN * *Lab of Animal Nutrition, Alabama Polytechnic Inst , Auburn*

Previous work has shown that supplements of alpha tocopherol given to young rats on a low casein, vitamin E-free diet increased growth and protein utilization, gave marked protection against CCl₄ and prevented a fatal lung hemorrhage-liver necrosis syndrome which occurred after about 3 months The diets used in this work contained no added source of vitamin B₁₂, folic acid or biotin (HOVE, E L, D H COPELAND AND W D SALMON *J Nutrition* 39: 397, 1949) When boiled egg white or fibrin replaced casein as the protein source at 10%, supplements of 1 mg alpha tocopherol daily did not increase growth or give protection against CCl₄ However, on diets with defatted whole wheat or soybean meal as the protein source, vitamin E increased growth and protein utilization When vitamin B₁₂ concentrate was added at a level equivalent to 30 µg/kg to diets containing soybean meal, casein or whole wheat, the protein efficiency ratios increased

sharply and vitamin E supplements were without apparent benefit Folic acid or biotin did not influence the results Supplements of vitamin B₁₂ offered some protection against CCl₄, but under the conditions used could not replace vitamin E, the combination was more effective than either alone Against the fatal lung hemorrhage-liver necrosis syndrome vitamin B₁₂ gave little protection although in some experiments the time of onset was delayed

Use of chromium oxide as indicator of digestibility E A KANE,* W C JACOBSON* AND L A MOORE *Division of Nutrition and Physiology, Bureau of Dairy Industry, Agricultural Research Administration, U S Dept of Agriculture, Washington, D C*

It was shown by a direct comparison, that digestibility coefficients obtained with both lignin and chromium oxide ratios by total collection of feces, were in excellent agreement with those determined by the standard total collection method The next problem was to determine how many samples of feces/day are necessary to attain the same accuracy and reliability with the ratio technique as with the standard total collection method In order to obtain fundamental data on this point, the following experiment was undertaken Around 15 gm of chromium oxide had been fed to 3 cows for approximately 90 days in connection with the previous trials Then, during a period of 24 hours, each passage of feces from each cow was collected, mixed, and sampled Each sample was analyzed separately for dry matter and chromium oxide The percentage of chromium oxide in each passage from each cow was determined and averaged for the 24-hour period, the averages for the 3 cows being 0.370, 0.350, and 0.367%, respectively These results compare favorably with the averages of total daily collections for the 9-day period immediately preceding this 24 hour experiment, which were 0.375, 0.354, and 0.362%, respectively The range of variation in percentage of chromium oxide in the feces of the 3 cows, during the 24-hour period, was 0.060, 0.081, and 0.082%, respectively An analysis of variance revealed a highly significant difference between cows and between A M and P M samples Therefore, the time of day of sampling, in addition to the number of samples, is important and should be considered in deciding on a reliable procedure for accurate sampling of feces for digestibility studies where the ratio technique is used

Improvement in the nutritive value of milled rice MARINUS C KIK *Univ of Arkansas, Fayetteville*

The proteins of milled rice rations (percentage composition milled rice, 89, salt mixture, 4, cellulose flour, 2, wheat germ oil, 3, cod liver oil, 4) were

supplemented by those of dry skim milk, dry whole milk, and dry whole egg. The rations were *ad libitum* and paired fed to rats receiving daily an ample supply of members of the vitamin B complex. Six males and 6 females were used in experiments of 90 days duration. The supplements were fed at a 1, 3, and 5% level replacing an equivalent amount of protein in the milled rice ration. The rice ration had a protein content of 5.46%, milled rice, 6.14%, dry skim milk, 33.8%, whole milk, 24.0%, and whole egg, 45.2%. The average difference in gain/1000 gm of food intake in the *ad libitum* feeding experiments at the 1, 3, and 5% level was for dry skim milk 14, 27, and 35 gm respectively. For whole milk 1, 27, and 31, and for whole egg 5.2, 23.3, and 18.7 gm. Lower values were found in the paired feeding experiments. The quality and quantity of the milk solids proteins favorably influence the nutritive value of milled rice, as do also their vitamin A, thiamine, riboflavin, and calcium content.

Utilization of a pantothenic acid conjugate (PAC) for rat growth TSOO E. KING,* FRANK M. STRONG* AND VERNON H. CHELDELIN, *Dept of Biochemistry and the Enzyme Inst., Univ of Wisconsin, Madison*

A pantothenic acid conjugate (PAC) described by the authors has been found more active than the free vitamin in certain microorganisms (KING, FELS AND CHELDELIN, *J Am Chem Soc* 71: 131, 1949). It exists in various animal tissues. The present experiment was designed to test the degree of activity of the conjugate in growing rats. Eighty albino rats of the Sprague-Dawley strain, of body weight 40 ± 2 gm, were separated into 11 groups of 6 to 10 animals each. They were maintained on a purified diet which was supplemented with graded amounts of PAC or calcium pantothenate, administered either orally or intraperitoneally. PAC was prepared according to previously described methods and was freed from coenzyme A and from free pantothenic acid by prolonged dialysis against distilled water. The intraperitoneal administration of a sample of PAC containing 5% bound pantothenic acid showed that the conjugate was at least as active as equivalent amounts of pantothenic acid. PAC by oral administration was slightly less effective than the free vitamin. The feasibility of developing a rat growth method for total pantothenic acid in tissues is discussed.

Lysine deficiency in rats fed zein diets W. A. KREHL AND DAVID KLIGLER,* *Yale Nutrition Lab, Dept of Physiological Chemistry, Yale Univ., New Haven, Conn.*

Attempts were made to produce an uncomplicated lysine deficiency in growing albino male and female rats of the Sprague-Dawley strain. Even when zein was supplemented to theoretically ade-

quate levels with missing amino acids and used in an otherwise adequate diet, it did not promote optimum growth. Experiments were conducted to determine the reasons for this observation. Supplementation of the zein diet with additional essential amino acids and a variety of growth factors, proteolytic hydrolysis of the zein, and supplementation with small amounts of an adequate protein (casein) were all attempted. The results obtained indicate that lack of growth in rats fed supplemented zein diets can be attributed to inadequate digestion of the protein with the result that certain of the essential amino acids are released too slowly to be absorbed and join the metabolic pool of other essential amino acids. Addition of arginine, valine and threonine simultaneously provided the additional essential amino acids necessary for protein synthesis required for growth. Animals on the lysine deficient diet, in addition to their failure to grow, exhibited marked symptoms of deficiency characterized by ruffled hair, unsteady stance and gait and severe emaciation. These symptoms but not the growth failure were corrected by lysine supplementation. Histological studies of the liver, heart, kidneys, adrenals, and thyroid of the 'lysine-deficient' animals revealed no pathology although the liver appeared to contain less than the normal amount of fat.

Acetylation studies in patients with rheumatoid arthritis W. JAMES KUHLM,* HERBERT GERSHBERG* AND ELAINE P. RALLI, *Labs of Dept of Medicine, New York Univ College of Medicine, New York City*

The acetylation of PABA and of sulfadiazine by patients with rheumatoid arthritis was determined and compared to that of normal subjects. Acetylation was measured either by the oral administration of 500 mg of PABA or by the intravenous injection of 1 gm of sulfadiazine. Eight normals, and, up to the present, 8 patients with rheumatoid arthritis have been studied, both before and after the administration of calcium pantothenate. In both the normal subjects and in the patients with rheumatoid arthritis, the ability to acetylate was variable, but remained constant in a given individual. As measured by PABA the degree of acetylation of the amount excreted in the urine varied from 82-96% in both groups. Following the injection of sulfadiazine, from 7-20% of sulfadiazine excreted as acetylated. The oral administration of 10 gm of calcium pantothenate daily for periods of from 3 weeks-4 months to patients with rheumatoid arthritis did not appreciably influence the acetylation of either PABA or sulfadiazine. The results suggest that acetylation is not disturbed in patients with rheumatoid arthritis.

Urinary loss of amino acids in normal and undernourished males following single injection of amino acid mixture STANLEY LEVEY, ELLEN D HOGANSON AND JOHN E HARROUN (introduced by ARTHUR H SMITH) *Dept of Physiological Chemistry, Wayne Univ College of Medicine, Detroit and Wayne County General Hospital, Eloise, Mich*

The excretion of 9 amino acids (arginine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, threonine and valine) was determined in the urine of 4 normal and 4 undernourished male subjects following the intravenous infusion of an assayed amino acid mixture. The amino acids were estimated using microbiological methods. The degree of undernutrition in the subjects studied ranged from moderate to severe as shown by clinical and laboratory studies. No difference was found in either the excretion of the individual amino acids or the relative excretion pattern which could be correlated with the nutritional state of the subjects. The amount of any amino acid retained was considered to be the difference between that injected and that amount excreted in the urine. The retention of the individual amino acids studied ranged from 99% for arginine to 81% for threonine. Retention of the individual amino acids could not be correlated with the nutritional status of the subject. The excretion of bound amino acids (those freed by acid hydrolysis) was also studied. In spite of the fact that the infused amino acid mixture was free of bound amino acids, an increased urinary loss of bound leucine, lysine, and valine was found following the injection of this amino acid preparation as compared to the urinary loss following an infusion of physiological saline. The 'saturation or load' test used for the evaluation of the nutritional state in regard to certain vitamins, does not appear applicable for studying protein nutrition.

Studies on vitamin A deficiency in the mouse

PATRICIA MCCARTHY* AND LEOPOLD R CERECEDO *Dept of Biochemistry, Fordham Univ, New York City*

A study of vitamin A deficiency was made in 3 strains of white mice in order to determine what changes occur throughout the body, and whether these changes are the same as those described for the rat. Weanling mice placed upon a 30% casein, 15% fat, vitamin A-free diet grew normally and did not exhibit the typical vitamin A deficiency syndrome, although rats responded to this regime, within 4 to 7 weeks. In order to decrease the depletion period, and to secure uniformity in the time of appearance of symptoms, different dietary regimes were devised. By varying the nutritional background of the weanling it has been possible to set up conditions under which 80% of the young

mice will develop the typical deficiency syndrome within a relatively narrow range. The time of appearance of symptoms is determined by the stringency of pre-natal and lactational treatment. The effect of vitamin E-free and fat-free diets on the depletion period was also investigated. Histological studies were carried out on various tissues. Reproduction studies indicate that the reproductive function in the male has been virtually destroyed by the absence of vitamin A from weaning. In the female, the reproductive function has been greatly impaired, but not destroyed. The young of such females are viable. In a study of the minimum daily requirement, our data indicate that the minimum requirement is in the neighborhood of 1 IU per day.

Effect of various amino acids and vitamin B₁₂ on chick growth L J MACHLIN,* J L MILLIGAN,* C A DENTON* AND H R BIRD *Bureau of Animal Industry, U S Dept of Agriculture, Beltsville, Md*

Amino acids and vitamin B₁₂ were investigated as supplements to corn-soybean meal and cottonseed meal diets for growing chickens. Protein concentrates were added so as to supply 22% protein. In addition the diets contained 3% alfalfa leaf meal, butyl fermentation solubles, tricalcium phosphate, limestone, salt, manganese sulfate, niacin, and a vitamin B₁₂ concentrate on charcoal. Choline was added to the cottonseed meal diet. The diets were assayed microbiologically for all essential amino acids. The soybean meal diet contained 0.22% methionine and the cottonseed meal diet 0.7% lysine. Addition of 0.1% DL-methionine to the soybean meal diet gave maximal growth response of the chicks. A level of 0.8% DL lysine monohydrochloride gave the best growth on the cottonseed meal diet. No additional growth was obtained when amino acids other than methionine or lysine were fed although tryptophane and glycine levels in both diets and methionine and tyrosine levels in the cottonseed meal diet were on the border line. In studying the effect of B₁₂, chickens from animal-protein-depleted dams were used and the B₁₂ concentrate omitted from the basal diets. Average weight in gm at 5 weeks in a typical experiment were: soybean meal basal 253, plus B₁₂ 304, plus methionine 282, plus B₁₂ and methionine 335, cottonseed meal basal 200, plus B₁₂ 217, plus lysine 296, plus B₁₂ and lysine 311. When B₁₂ was replaced by an animal protein factor concentrate the chickens weighed 267 without and 359 with lysine.

Variations in nitrogen-balance data on college girls BEULA V McKEY,* DOLORES MALONEY COREY* AND JANICE M SMITH *Agricultural Experiment Station, Dept of Home Economics, Univ of Illinois, Urbana*

Five girls, 19-23 years of age, cooperated in a study of the reproducibility of nitrogen balance data from September, 1947 to June, 1948. During this time, determinations of nitrogen balances were compared with values obtained on the same subjects 3-5 months later. In 11-day test periods, 3.2, 2.4, 1.9, 1.4 or 0.2 gm nitrogen daily were fed. Except at the lowest intake, nitrogen was supplied by bread, rolled oats, lean beef, light cream and potatoes. The composition of the basic diet and proportions of protein foods are described in the publication by Bricker *et al* (*J Nutrition* 37: 163, 1949). The average nitrogen balance for all subjects at the 2nd time of feeding was significantly lower than at the 1st in 4 of the 5 comparisons (exception at 1.9 gm). These average nitrogen balances (expressed in gm/day) with the standard errors for the 1st and 2nd tests respectively, were as follows for the 5 nitrogen levels: 3.2 gm, -0.403 ± 0.0960 , -0.008 ± 0.0534 ; 2.4 gm, -0.219 ± 0.0389 , -0.028 ± 0.0464 ; 1.9 gm, -0.654 ± 0.0571 , -0.319 ± 0.0395 ; 1.4 gm, -1.1059 ± 0.0498 , -0.815 ± 0.0436 ; 0.2 gm, -1.814 ± 0.0274 , -1.488 ± 0.0418 . Biological values were 61 ± 4.0 , 74 ± 2.8 and $85 \pm 2.9\%$ at the 3.2, 2.4 and 1.4 intakes respectively. These biological values were significantly different in all possible comparisons indicating that the biological value estimated in this study was influenced by the amount of nitrogen fed.

Studies on lactalbumin heated with carbohydrate

IVAN J. MADER,* LAWRENCE J. SCHROEDER* AND ARTHUR H. SMITH, *Dept of Physiological Chemistry, Wayne Univ College of Medicine, Detroit, Mich*

A comparison of *in vitro* and *in vivo* studies was made in an attempt to evaluate the role of heat and carbohydrate concentration in the non-enzymatic browning of proteins as exhibited in the Maillard Reaction. Commercial and 'carbohydrate-free' lactalbumin, heated under various conditions, was used in *in vitro* digestion experiments. The conventional formol titration procedure, showed that the rate and amount of digestion of the protein by pancreatin is inversely proportional to the severity of heat treatment. Removal of reducing substances from lactalbumin before heating permits a greater rate and degree of enzyme hydrolysis of the heated product. Microbiological assays for valine, histidine, leucine, phenylalanine, lysine and methionine in acid hydrolysates of the various proteins showed that only lysine was partially destroyed. These observations suggest that the carbohydrate reacts with the protein to form enzyme-resistant materials. A nitrogen balance study in dogs was used to determine the relative effect of heat and of carbohydrate in the alteration of the nutritive

value of heated protein. 'Carbohydrate-free' lactalbumin and extracted lactalbumin to which had been added 2 and 5% lactose served as the protein nitrogen sources. The time of autoclaving of these proteins was varied from one-half to one hour. The biological value was high in all cases. However, as either the carbohydrate concentration or the time of heating was increased, the nutritive index of the protein decreased. Lowered digestibility, shown by increased fecal nitrogen, accounted for the decrease in nutritive value.

Chronic riboflavin deficiency in Cebus monkeys

GEORGE V. MANN AND PATRICIA L. STEVENS (introduced by FREDRICK J. STARE) *Dept of Nutrition, Harvard School of Public Health, and Dept of Biological Chemistry, Harvard Med School, Boston, Mass*

Young Cebus monkeys were studied upon a purified diet with and without the addition of crystalline riboflavin. Without added riboflavin the diet furnished 25 γ or less of riboflavin per 100 gm of diet. With added riboflavin this diet is adequate for periods of at least 2 years. Without added riboflavin animals on this diet began a steady decline of weight within 2 weeks. Although appetite remained good and food consumption 80% or more of normal, after 6 months weight loss amounted to 30%-40% of the original weight. No mucous membrane or ocular lesions were seen. In one of 6 animals a seborrheic dermatitis with yellow encrustations developed over the dorsum of the hands and on the tail with slight loss of hair. In another instance a pre-existing fungal dermatitis showed extension and exacerbation. Plasma levels of free and combined riboflavin decreased to levels 20% of normal. The sequence was diminution of free riboflavin plus flavin-mononucleotide followed by a fall of flavin-adenine-dinucleotide. Total 'flavin' concentration reached a minimal level of 0.5-1.0 $\gamma\%$ after 80-100 days and remained there until death. Hematological studies reveal no evidence of anemia but rather of a polycythemia which progresses until death. Cell indices, white blood count, and differential remain unchanged. Plasma volume and total protein determinations indicate no contraction of fluid volume to account for this polycythemia. Glucose tolerance tests reveal no abnormality of carbohydrate metabolism. Response to riboflavin suggests that minimal daily requirement for growth is between 30 and 50 γ /kg/day.

Nutrient intake and serum blood levels of children showing physical signs of vitamin deficiencies. SUSAN B. MERROW,* R. F. KRAUSF,* J. H. BROWE,* C. A. NEWHAIL* AND H. B. PIERCE, *Depts of Biochemistry and Anatomy, Univ of Vermont College of Medicine, Burlington*

Twenty-four hour food intake records were secured in the winter, spring and fall of 3 consecutive years as part of a study investigating relationships between physical findings, blood chemistry and food intakes of school children. All subjects exhibited generally accepted signs of vitamin deficiencies attributed to inadequate amounts of vitamin A, riboflavin, niacinamide and/or ascorbic acid. Three groups of subjects were selected that had 'high' or 'low' blood levels of vitamin A, carotene or ascorbic acid during the 3 years. The vitamin A, carotene and ascorbic acid intake of the higher and lower blood level groups for each of the above mentioned 3 blood constituents were compared. Study was also made of the blood values of subjects whose nutrient intake for each of the 3 food constituents was above or below a certain value. Blood levels of these 3 nutrients were compared for each of the 3 higher and lower nutrient intake groups. The higher dietary intakes of carotene, total vitamin A, and ascorbic acid appear to be more indicative of the higher blood levels of these 3 nutrients than the lower dietary intakes of carotene, total vitamin A and ascorbic acid are indicative of the lower blood levels of these same nutrients. Blood content of vitamin A and carotene appear to be a poor indication of dietary intake of these nutrients. The higher blood values of ascorbic acid reflect dietaries of above 40 mg of ascorbic acid and the lower blood values dietaries under 40 mg of this nutrient.

Physiological and histological changes in the folic acid-deficient duckling O NEAL MILLER, J W GODDARD AND ROBERT E OLSON (introduced by FREDRICK J STARE)

In addition to anemia, folic acid deficiency in ducklings causes a depression in the respiration of erythrocytes and a decrease in pyruvate utilization by cardiac muscle (*Federation Proc* 8 390, 1949). The failure of these birds to gain weight despite a high food intake suggested that additional lesions might be found in the gastrointestinal tract or in its associated glands. Young ducklings were fed a purified diet low in folic acid and supplemented with sulfaguanidine. When deficiency signs became manifest, these birds were killed and samples of liver, gut, and pancreas were fixed for histological examination. Determinations of blood sugar, liver glycogen and fat, and the titre of duodenal amylase and trypsin were made at the same time. Deficient ducks showed markedly decreased liver glycogen, slightly increased liver fat, normal blood sugar levels, and markedly decreased duodenal amylase and tryptic activity. Histological and histochemical examination of the liver, pancreas, and intestine showed 1) decrease in alkaline phosphatase and glycogen in the liver,

2) clumping and reduction in number of mitochondria and dislocation and decrease in the number of zymogen granules with evidence of inhibition of their release in the pancreas, and 3) virtually no change in the intestine. It is concluded that experimental folic-acid deficiency in the duck causes biochemical and pathological changes in the liver and pancreas, which may account for some of the signs noted in this disease.

Nitrogen balance index of adult rats fed amino acid mixtures low in valine E S NASSET AND JOSEPH T ANDERSON * *Dept of Physiology and Vital Economics, Univ of Rochester School of Medicine and Dentistry, Rochester, N Y*

Nitrogen balances were determined on adult male rats fed diets containing various amino acid mixtures by stomach tube (ANDERSON AND NASSET *J Nutrition* 36 703, 1948). Each experiment included one week on a nitrogen-free diet, a second week in which the amino acid mixture was incorporated at about half-maintenance quantity, a third week at full maintenance quantity. In a single group of rats (series 140) a 'complete' amino acid mixture, simulating whole egg protein, was tested before and after whole egg protein. The nitrogen balance index of ingested nitrogen (K') computed from the half-maintenance and full-maintenance periods is 1.18 for egg protein and 0.99 for the 'complete' amino acid mixture. Another amino acid mixture containing only one-twelfth the DL-valine of the 'complete' mixture (9.0 mg DL-valine nitrogen per gram of total nitrogen) gave a K' of 0.44. A similar amino acid mixture containing the same total valine but all in the L-form gave a K' of 0.51. The significance of these values in relation to the utilization of D valine will be discussed.

Quantitative vitamin B₁₂ requirement of the pig R O NESHEIM* AND B CONNOR JOHNSON *Division of Animal Nutrition, Univ of Illinois, Urbana*

The synthetic 30% alpha-protein ration previously shown to be deficient in vitamin B₁₂ was fed in 2 experiments to groups of 2-day old pigs. The first experiment was designed to determine the quantitative vitamin B₁₂ requirement when the vitamin was given intramuscularly, and the second, when vitamin B₁₂ was given orally. In experiment 1, 14 two-day-old pigs were individually fed the basal diet for a 2-week depletion period. They were then allotted to 5 groups. Groups 1-5 were given by i.m. injection respectively 0, 0.1, 0.3, 0.4 and 0.6 µg of crystalline vitamin B₁₂/pig/kg of body weight daily. The gains of the pigs in group 5 were significantly greater than those in any other group and appeared optimum. Thus the requirement is not less than 0.6 µg of vitamin B₁₂/kg body weight/day. In

experiment 2, 15 two day-old pigs were allotted to 5 groups. Groups 1-4 received in their diets, respectively, 10, 15, 20 and 10 μ g of crystalline vitamin B₁₂/kg of dry matter of the diet, and group 5 was given intramuscularly 0.6 μ g of crystalline vitamin B₁₂/kg body weight daily/pig to correlate the 2 experiments. The results (weight gains, blood and bone marrow data, organ weights, and deficiency symptoms) of these experiments will be reported.

Response of *Leuconostoc citrovorum* to tryptic digests of casein CHARLES A. NICHOL* AND ARNOLD D. WELCH Dept of Pharmacology, Western Reserve Univ School of Medicine, Cleveland, Ohio

In an amino acid medium, the growth of *Leuconostoc citrovorum* SOS1 is insignificant when a tryptic digest of casein (prepared by the method of SKEGGS, *et al* J Biol Chem 176 1459, 1948) is added in amounts equivalent to 100 mg of casein/tube (10 ml). However, 12.5 mg of the hydrolyzed casein/tube potentiates greatly the response of the organism to thymidine (5-40 μ g/tube). A similar effect is exerted on the response to a highly concentrated liver fraction containing the so-called citrovorum factor (SAUBERLICH AND BAUMANN J Biol Chem 176 165, 1948). In the presence of both thymidine and the citrovorum factor, the potentiating effect of the casein hydrolysate is very striking. The substance responsible for the activity of the enzymatic digest of casein is stable at pH 12 at 100° for at least 30 minutes. Studies on the nature of the factor, its role in the growth of the organism, and its influence on the accuracy of assays for the citrovorum factor are now in progress.

Maternal nutrition and hydrocephalus in infant rats B. L. O'DELL* AND A. G. HOGAN Dept of Agricultural Chemistry, Univ of Missouri, Columbia

Female rats maintained on a synthetic diet bore a few young, less than 2%, that had hydrocephalus. The original diet, made up chiefly of casein and glucose, was recently replaced by a diet made up of Soybean oil meal 70, cerelose, 22, salts, 4, lard, 4, and the following vitamins: A, 2000 IU, D, 283 IU, E, 1 mg, K, 1 mg, thiamine, 1.6 mg, riboflavin, 1.6 mg, pyridoxine, 1.6 mg, Ca-pantothenate, 4 mg, choline, 100 mg, biotin, 20 mg. The incidence of hydrocephalus on the soybean oil meal diet was a fraction of 1%. Earlier observations had indicated that the incidence of hydrocephalus was markedly lowered when folic acid was added to the casein diet and this suggested that the incidence of hydrocephalus might be increased if the effective amount of folic acid in the diet were reduced. When the soybean oil meal diet was supplemented with a folic acid

inhibitor (crude methyl folic acid generously supplied by T. H. Jukes, Lederle Laboratories) the incidence of hydrocephalus rose sharply within 4 weeks and the results were about the same with amounts of the inhibitor varying from 1-10 mg/100 gm of diet. The total number of young born after the change was 320 and the total number of hydrocephalics was 72. The number of hydrocephalics/litter varied from 0-13.

Folic acid metabolism in normal human subjects

LURA MAF ODLAND* AND HELEN T. PARSONS
Dept of Home Economics, Univ of Wisconsin, Madison

The urinary excretion levels of folic acid of 33 university women consuming constant weighed basal diets and supplements of 1, 3, 5 and 10 mg of pteroylglutamic acid for a total of 313 subject-days were determined microbiologically with *Streptococcus faecalis*. On the basal diet providing 0.4 mg of folic acid daily, 29 subjects excreted a mean of 3.7 μ g (range 0.8-9.6) of folic acid/day—a mean of less than 1% of the intake. With a 1 mg test dose in 35 observations on 15 subjects, a mean of 2.7% (0.3-4.9) of the dose was excreted in the urine, a relatively small increase although this level of intake much exceeds the amounts present in ordinary diets and the provisional recommended allowance. However, with the administration of a 5 mg test dose, the percentage return rose markedly to a mean of 38% (30-46) for 59 observations, and for a 10 mg dose, to a mean of 50% (37-63) in 41 observations. Thus the rapid increase in the percentage excretion with increases in test dose size was not maintained beyond the 5 mg intake level. Human bioassays of the availability of folic acid placed 3 food sources in the following descending order: cooked frozen chicken livers, dehydrated cereal-grass tablets and dried debittered brewers' yeast, in rough correlation with the proportion of the free form of folic acid present in the test materials.

Electrolyte changes in thiamine deficiency LOUIS J. PECORA (introduced by FLOYD S. DAFT)
Experimental Biology and Medicine Inst., National Insts of Health, Bethesda, Md

Hypo- and hyperpotassemia have been reported to produce alterations in the S-T take-off and T wave in the electrocardiogram of animals and man. Thiamine-deficient rats have similar electrocardiographic changes suggesting that an electrolyte disturbance might occur in this condition. Fifteen male weanling Sprague-Dawley rats were fed a thiamine-free, otherwise adequate, purified diet. For the first 7 weeks each rat received 3 γ of thiamine daily, thereafter none. Litter mates to 10 of these rats were pair-fed the same diet containing 200 γ of thiamine per 100 gm of diet, and 5 control rats were fed the same diet *ad libitum*.

The heart body weight ratio was 0.33% for the control and pair-fed rats and 0.38% for the thiamine-deficient rats. The water content of the fat-free skeletal and cardiac muscle of each group was $77\% \pm 1$. A decreased potassium and an increased sodium level was observed in the skeletal and cardiac muscle of the thiamine-deficient rat. The pair-fed rats showed no change from the control values. The phosphate content of serum, skeletal and cardiac muscle was similar in each group. These electrolyte changes may account in part for some of the cardiac alterations observed in thiamine-deficient rats.

Effects of vitamin therapy on school children

H. B. PIERCE, R. F. KRAUSE,* J. H. BROWE,*
SUSAN B. MERROW* AND C. A. NEWHALL* *Depts
of Biochemistry and Anatomy, Univ. of Vermont,
College of Medicine, Burlington*

A study has been made of school children having one or more of the usually accepted physical signs of deficiencies of vitamin A, ascorbic acid, niacin or riboflavin for seasonal periods in each of 3 consecutive years. Children were grouped according to type and severity of lesion, sex and age (under and over 12 years of age). Four groups, vitamin A, ascorbic acid, niacin and riboflavin were established and each group was subdivided into control and therapy sections. Therapy was administered with each of the above vitamins in amounts approximately 4 times the recommended daily dietary allowances of the National Research Council. Bloods were analyzed for hemoglobin, serum protein, alkaline phosphatase, vitamin A, carotene and ascorbic acid in the spring, fall and winter according to the microchemical methods of Bessey and his associates. Vitamin A blood levels were significantly elevated by vitamin A therapy and not significantly changed by the other 3 types of therapy. Ascorbic acid therapy resulted in a significant elevation of blood ascorbic acid, but no such effect was observed with the other 3 types of therapy. The ascorbic acid therapy group had significantly lower carotene levels than control children, other types of therapy having no significant effect upon blood carotene. Hemoglobin and serum protein levels were not significantly improved by the therapy used. Children in all therapy groups showed a significantly greater increase in height and a tendency to increase more in weight than children in control groups.

Ascorbic and glucuronic acids as growth factors in chicks

MARY ELIZABETH REID *Experimental
Biology and Med. Inst., National Inst. of Health,
Bethesda, Md.*

One-day old New Hampshire Red chicks were supplied a modified form of the Franklin *et al.* diet with Brigg's salt mixture at a 6% level.

The chicks were injected daily, some with ascorbic acid, others with glucuronic acid and the control groups with normal saline. Nine chicks were used in each group in the first test, conducted in summer, and 9 males and 9 females in each group in the second test, conducted in winter. In the summer test, males receiving ascorbic acid gained 31% more than controls whereas in the winter test they gained 3% less in 32 days. Females receiving ascorbic acid, however, increased markedly in weight over controls in both tests, in the first experiment the gains were 53% greater and in the second 42%. Males did not grow more with glucuronic acid in either test whereas females gained 20% more than controls in the first and 27% more in the second. In males, liver to body weight ratios increased slightly with ascorbic acid in the summer test whereas no change occurred in winter, the liver ascorbic acid concentrations remaining fairly constant. In females, the liver to body weight ratios increased in both tests with ascorbic acid and the concentration of the vitamin was also greater. These observations confirm and extend the results of other investigators and offer interesting possibilities for further research.

Effect of tryptophane depletion and repletion on enzyme activities of tissues of chick

WALTER C. RUSSELL, M. WIGHT TAYLOR AND I. WILLIAM LANE* *Dept. of Agricultural Biochemistry, New Jersey Agricultural Experiment Station, Rutgers Univ., State Univ. of New Jersey, New Brunswick*

Deprivation of individual essential amino acids causes, in general, decreases in liver esterase and phosphatase, and in pancreatic amylase, lipase and protease, but an increase in liver catalase. When chicks were deprived of tryptophane for 2 weeks, there was a decrease in blood catalase and a rise in liver catalase. Liver esterase and phosphatase remained essentially normal but marked decreases in activity of pancreatic amylase, lipase and protease occurred. Provision of an adequate supply of tryptophane, following 2 weeks of depletion, and observations for a 4 week period, showed a gradual return to normal of blood and liver catalase, a rapid return to a normal value for pancreatic protease, and to a slightly subnormal value for pancreatic lipase. Immediately following repletion there was an upsurge of the value for pancreatic amylase to 67% above normal which gradually lowered to normal during the 4 weeks of repletion. It is of interest that during deprivation of the amino acid, values for blood catalase fall whereas those for liver catalase rise, suggesting that the enzyme either plays a different role in the 2 tissues or that the rise in the liver is at the expense of that in the blood. The data show that changes in enzyme activities caused by deprivation of tryptophane are revers-

able if an adequate quantity of the amino acid is provided

Effects of protein level, vitamin B₁₂, and folacin on utilization of methionine for transmethylation
W D SALMON *Lab of Animal Nutrition, Alabama Polytechnic Inst, Auburn*

Weanling rats were fed choline-free diets containing 7 or 9% of casein and corn gluten meal and sufficient DL-methionine to prevent kidney lesions in a 2-week period. When 10% of gelatine was added, at the expense of sucrose no kidney damage occurred, the further addition of 0.10% DL tryptophane resulted in 100% incidence of renal damage but tryptophane without gelatine had no effect. Vitamin B₁₂ alone did not decrease incidence of kidney damage by the gelatine-tryptophane-containing diet but vitamin B₁₂ and folacin together decreased incidence 50%. A 50-100% incidence of renal injury developed in rats receiving a choline free, synthetic diet containing 60% of alcohol extracted casein. Vitamin B₁₂ and folacin, or these vitamins together with 0.64% DL methionine, did not consistently increase growth or decrease incidence of renal damage. Choline alone (0.20%) prevented kidney lesions but had little effect on growth. Choline together with vitamin B₁₂ and folacin produced normal growth and grossly normal kidney condition, ethanolamine appeared to be as effective as choline in this combination. The results indicate a significant effect of protein level on utilization of methionine and a specific relationship of vitamin B₁₂ and folacin to transmethylation in the rat.

Effect of oral administration of streptomycin on B vitamin excretion in man
HERBERT P SARETT AND GRACE A GOLDSMITH *Nutrition Research Lab, Tulane Univ School of Medicine, New Orleans, La*

The effects of administration of streptomycin on the urinary excretion of thiamine, riboflavin, folic acid, and N'-methylnicotinamide, and on the excretion of niacin compounds following tryptophan supplements, were studied in subjects maintained for 24 to 40 days on regulated diets. After suitable control periods, streptomycin (calcium chloride complex) was administered orally for 8-12 days in doses of 1 gm 4 times daily. Within a few days, stool cultures showed either complete or partial inhibition of growth of coliform organisms. The excretion of thiamine, riboflavin and folic acid was not decreased during streptomycin administration and in one subject was increased after 6-8 days of treatment. N'-methylnicotinamide excretion was decreased in one subject and not changed in two other subjects. Excretion of pyridoxine compounds, as measured by *S. carlsbergensis*, was determined in one subject and found to be unaffected by streptomycin. The

addition of tryptophan to the control diet led to increases in excretion of quinolinic acid and N'-methylnicotinamide. This conversion of tryptophan to niacin compounds did not appear to be affected by streptomycin administration and the concomitant decrease in intestinal flora.

Interactions between ascorbic acid and plasma and amino acids
failure to find bound ascorbic acid in plasma
FREDERICK SARGENT, II AND RALPH GOLDFIN (introduced by R E JOHNSON)
Army Med Nutrition Lab, Chicago, Ill

The fact that the formed elements of human blood give up their content of ascorbic acid much more slowly than does plasma led to the hypothesis that ascorbic acid was bound to a non-diffusible substance, probably a protein. Since earlier investigations had yielded conflicting data regarding the existence of bound ascorbic acid in any part of human blood, systematic physico-chemical and chemical studies were first made on plasma. The methods used were 1) measurement of rate of diffusion of ascorbic acid through a semi-permeable membrane in plasma, a mixture of amino acids, and various control solutions at 37° C, 2) ultrafiltration of plasma, 3) spectrophotometric analysis of solutions of ascorbic acid before and after addition of plasma, amino acids, glucose, and NaCl, and 4) acid hydrolysis of trichloroacetic acid filtrates of plasma after a modification of the method of Guha *et al*. The following significant findings were made 1) with gradients ranging from 0.5 to 4.5 mg % of ascorbic acid, the rate of diffusion was not significantly different in plasma, amino acids or 0.55 M NaCl, but the rate of diffusion was significantly slower in plasma than in Ringer-Locke's solution or distilled water 2) The concentration of ascorbic acid in ultrafiltered plasma was the same as that in the protein-free ultrafiltrate 3) Spectrophotometry failed to indicate the formation of a compound between ascorbic acid and plasma or amino acids 4) Plasma did not contain ascorbigen, a bound ascorbic acid described by Guha *et al*. From these investigations the authors conclude that plasma does not contain a firmly bound non-diffusible form of ascorbic acid. The presence of a loosely bound form of ascorbic acid, however, is not precluded by the methods used.

Role of vitamin B₁₂ and methyl donors in lipotropism and transmethylation in the rat and chick
A E SCHAEFER,* W D SALMON AND D R STRENGTH * *Lab of Animal Nutrition, Alabama Polytechnic Inst, Auburn*

The relation of vitamin B₁₂ to the quantitative effectiveness of monomethylaminoethanol, dimethylaminoethanol, betaine, DL-methionine and choline as methyl donors for the prevention of renal damage and fatty livers in rats and for

growth and perosis-prevention in chicks was studied. The choline requirement of weanling rats for protection against fatty livers was reduced from 0.16% to 0.10% when the diet was supplemented with vitamin B₁₂ and folacin. On the basis of methyl content monomethylaminoethanol and betaine were considerably less active for growth and prevention of renal damage and fatty livers in the rat than dimethylaminoethanol or choline when vitamin B₁₂ and folacin were omitted from the diet. In the presence of vitamin B₁₂ all the above compounds were equivalent to choline on a methyl basis. Three mols of betaine were required to replace 1 mol of choline. For the chick, betaine, DL-methionine or monomethylaminoethanol, even in the presence of vitamin B₁₂, could not replace choline for growth and protection against perosis. Monomethylaminoethanol and either DL-methionine or betaine could replace choline on a methyl basis only when supplemented with vitamin B₁₂. Vitamin B₁₂ appears to function in methylation processes.

Effect of feeding polyoxyethylene monostearate preparations on growth rate and gross pathology of weanling hamsters B. S. SCHWEIGERT,* B. H. MCBRIDE* AND A. J. CARLSON. *Division of Biochemistry and Nutrition, American Meat Inst. Fdn., Dept. of Biochemistry and Dept. of Physiology, Univ. of Chicago, Chicago, Ill.*

Weanling hamsters (4-6 weeks of age) were fed a purified diet for a 2-week preliminary period and then the effect of feeding 2 polyoxyethylene monostearate preparations (Sta-Soft and MYRJ 45) as compared to lard on the growth rate, food efficiency, mortality, gross pathology and organ weights was determined. Thirty-three animals were used in each group and the animals were kept in individual cages. The following dietary regimens were used: 5% lard, 5% Sta-Soft, 5% MYRJ, 5% lard with the food intake of the group restricted to the average amount consumed by hamsters fed Sta-Soft or MYRJ, whichever was the least, 15% lard, 15% Sta-Soft, 15% MYRJ, 15% lard with the food intake restricted as above, and 7½% lard plus 7½% CellufLOUR. The latter group was included in order to test the effect of ingesting a substance that is essentially inert nutritionally (CellufLOUR) at a level that approximated the non-fatty acid moiety of the polyoxyethylene monostearate preparations. It was concluded from these experiments that Sta-Soft or MYRJ fed at either the 5 or 15% level in the ration of weanling hamsters significantly reduced the rate of gain as compared to the results obtained with lard. This was evident after 2 weeks on experiment. A reduction in food efficiency was also observed. The retarded gains were not attributable to reduced food intake or

the caloric inertness of the polyoxyethylene fraction. Marked changes in the intestinal tract and severe diarrhea were also observed when Sta-Soft or MYRJ was fed. Mortality data, and data on the organ weights also indicated that the ingestion of these compounds was deleterious as compared to the data obtained with lard.

Amino acid intakes and excretions of primigravidae on self-selected diets BERNICE BLUM SHEFT,* HELEN OLDHAM AND THELMA PORTER. *Dept. of Home Economics, Univ. of Chicago, Chicago, Ill.*

Amino acid intakes and urinary excretions of primigravidae living at home on self-selected diets were followed for 7-day periods during each of the last 5 months of pregnancy. All food eaten was weighed, samples were saved and representative aliquots for each period analyzed for isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophane, valine, arginine, histidine and total nitrogen. The intakes of other nutrients were calculated. Complete collections of excreta were made during each period. Aliquots of urine were analyzed for 'total' amino acids and nitrogen. Average daily protein intakes ranged from 59-82 gm, positive nitrogen balances were obtained when intakes were over 65 gm. For the most part, the average daily intakes of methionine were lower than the allowances recommended by Rose (*Federation Proc.* 8:546, 1949) for young men, those of the other essential amino acids were from 1-4 times those recommended. The excretions of threonine and methionine were consistently above the range found in normal adults, those of histidine were also in this category in approximately 50% of the periods of observation. The excretions of the other amino acids studied were within the normal range. No correlation was observed between the amounts of amino acids excreted and dietary intake, nitrogen balance, body weight or urine volume.

Effects of surface active agents when fed in the diet of hamsters HENRY SHERMAN,* ROBERT S. HARRIS AND WALTER W. JETTER. **Massachusetts Inst. of Technology and Boston Univ. School of Medicine, Boston, Mass.*

Sorbitan monolaurate (SL), polyoxyethylene sorbitan monolaurate (PSL), polyoxyethylene monolaurate (PL), and hydrogenated oil (HO) were fed as 5% and 15% of experimental diets to 11 groups of 36 weanling hamsters for 68 days. All diets contained casein, 24, sucrose, 61.16 or 51.16, cellufLOUR, 3, salts, 4, liver extract (1:20), 1, fortified cod liver oil, 0.3, cystine, 0.3, corn oil, 1, vitamin mixture (vitamin B₁, B₂, B₆, K, E, niacin, Ca pantothenate, choline, inositol, PGA, biotin, PABA), 0.24, and test substance, 5 or 15. One HO group was pair-fed with SL group, another re-

ceived 7.5% HO and 7.5% Celluloflour. Representative hamsters from each group were autopsied biweekly during test period, the remainder on 68th day. Experimental results are tabulated below. Hamsters fed PSL and PL developed severe diarrhea. Results of HIO pair-fed with SL indicate SL effects not due to starvation. Results of group fed 7.5% HO and 7.5% Celluloflour demonstrate inert component of test material not responsible. Results of autopsy and histological examination of animal tissues will be reported.

5% TEST COMPOUND	SL	PSL	PL	HO	HO-P
Wt increase (gm)	49	38	38	63	56
Wt incr/gm diet	12	08	07	13	15
Mortality (%)	11	40	64	17	8
15% TEST COMPOUND					
Wt increase (gm)	34			55	57
Wt incr/gm diet	12			16	18
Mortality (%)	22	100	100	8	10

The data indicate that SL, PSL, PL were toxic to hamsters when fed as 5% and 15% of a nutritionally adequate diet.

Pyridoxine and fats in metabolism HENRY SHERMAN,* LAURA M CAMPLING* AND ROBERT S HARRIS *Nutritional Biochemistry Labs, Massachusetts Inst of Technology, Cambridge*

Male weanling rats were placed on a laboratory diet consisting of Labco casein 20, corn starch 61.7, salt mixture 4 and pyridoxine-free vitamin mixture 0.3, modified by the following additions: cornstarch 14 (*diet FFPF*), plus 0.4 mg pyridoxine (*diet FF*), olive oil 14 plus 0.4 mg pyridoxine (*diet OO*), and hydrogenated fat 14 (*diet HFPF*) plus 0.4 mg pyridoxine (*diet HF*). *Diets FF, FFPF and OO* were fed concurrently for 42 days. Half those on *diets FF and FFPF* were continued on test for an additional 231 days, those on *diet FFPF* were divided into 3 subgroups and fed daily supplements of a) 0.02 mg pyridoxine, b) 30 mg linoleic acid as corn oil, or c) both. In a second series 2 groups of rats were fed *diets FF and FFPF* for 21 days, then each group was divided into 4 subgroups and fed *diets FF, FFPF, HF and HFPF* for an additional 56 days. Pyridoxine deficiency caused a decrease in appetite and markedly interfered with food utilization. Little pyridoxine was stored in rat tissues, for deficiency symptoms were evident within 5 days on the pyridoxine-free ration. Fat exerted a sparing action on pyridoxine since it retarded the development, and hastened the cure, of deficiency symptoms. Skin lesions which developed in rats on the fat-free and pyridoxine-free diet were partly due to essential fatty acid deficiency, but primarily to pyridoxine deficiency. Less fat and less arachidonic

acid were deposited in the carcasses of rats on the pyridoxine free diets. However, the percentage arachidonic acid in the carcass fat was higher. The biological synthesis of arachidonic acid was demonstrated in the groups which received pyridoxine.

Excretion of radioactive phosphorus into alimentary tract of rats on high molybdenum and copper diets RAY L SHIRLEY,* RILEY DEAL OWENS* AND GEORGE K DAVIS *Dept of Animal Husbandry and Nutrition, Florida Agricultural Experiment Station, Gainesville*

The excretion of intramuscularly injected phosphorus 32 into the various divisions of the alimentary tract of rats on rations containing added molybdenum and copper at levels of 0.0, 80.0, 0.35 and 80.35 parts/million, respectively, was determined at intervals ranging from 0.5-168 hours after administration. Fecal and urinary excretion rates were determined, as well as the occurrence of the isotope in the various alimentary tissues. Results were calculated as percentage dose and also as percentage dose/mg of total phosphorus. A maximum deposition was found in the alimentary tissues within 0.5-6 hours, in the contents of the small intestine in 1-6 hours, and in the contents of the cecum and large intestine in 24-96 hours after administration. The greatest excretion was through the small intestine and least through the stomach. All 4 groups of rats had their maximum and minimum excretion of the isotope into the various segments of the alimentary tract at approximately the same time, but the groups varied widely in the total amount of the isotope dose that was excreted. The control group excreted the most phosphorus-32, both in the feces and urine, while the high molybdenum, high copper, and high molybdenum-high copper groups excreted decreasing amounts, respectively.

Pyridoxine deficiency in the human being SELMA E SNYDERMAN, ROSARIO CARRETERO AND L EMMETT HOLT, JR *Dept of Pediatrics, New York Univ College of Medicine, New York City*

A pyridoxine-deficient diet, given for therapeutic reasons to two mentally defective infants for 76 and 130 days respectively, failed to produce clinical benefit but yielded information of nutritional interest. Both subjects developed evidences of pyridoxine deficiency, indicating that pyridoxine is a human dietary essential. The first change noted was the prompt disappearance of pyridoxic acid from the urine and a reduction of the total urinary pyridoxine to low values ranging from 0.2 to 2 μ g/day. Subsequently, both infants lost the ability to convert tryptophane to nicotinic acid, an effect which was desired in order to block a metabolic path for tryptophane that might be competing with normal tissue synthesis.

A plateauing of the weight curve occurred 33 and 73 days after the institution of the regime. On the 76th day one subject developed a series of convulsions which were promptly relieved by the administration of pyridoxine. The other subject developed a hypochromic anemia at approximately the 130th day. This responded dramatically to pyridoxine, a rise in reticulocytes was noted after 72 hours reaching a peak in 4 days after which red cell count and hemoglobin rose to normal. Both subjects gained weight normally after supplementation. In marked contrast to the excellent and prompt clinical response to the administration of pyridoxine was a delay in the reappearance of the ability to convert tryptophane to nicotinic acid.

Capillary fragility and vitamin P protective action against radiation BORIS SOKOLOFF, JAMES B. REDD AND RAYMOND DUTCHER (introduced by WALTER H. EDDY) *Southern Bio-Research Lab., Florida Southern College, Lakeland*

A clear distinction should be made between the terms 'capillary permeability' and 'capillary fragility'. The term 'increased capillary fragility' should be used only when there is an alteration in the chemical structure of the intercellular cement as evidenced by the method of tannin-ferric chloride. Using a vitamin-P compound isolated from citrus fruit, and containing 4 identified factors, a decrease in capillary fragility was found in rats and rabbits. A modified technique of Ambrose and DeEds was applied as well as the extract of inflammatory exudate (leukotaxine) with a pronounced delay in the diffusion of the dye. In another series of experiments 50 rats were submitted to X-ray irradiation. They were divided into 2 groups. One group of 20 rats served as control, while the second group of 30 rats were given vitamin P compound isolated from citrus fruit. The radiation factors were 250 kv 15 mm, with 0.5 mm Cu and 3.0 mm Bakelite filters. Target distance was 27.5 cm and 210 r/min dose rate. All the rats, both the controls and those treated with vitamin P, received 800 r total body radiation in a single exposure. Mortality rate of the control group, was 80%. All rats of this group manifested gross hemorrhages of various gravity and pronounced pathological lesions in the reticular zone of the adrenal cortex. The rats receiving vitamin P, 5 mg daily for 7 days prior to exposure and for 23 days post radiation, had a mortality rate of 10% with much less pronounced hemorrhagic diathesis. Histological investigation in the group of treated animals revealed only minor injury to the capillary wall with intercellular pores remaining intact. It appears that vitamin P factors have a specific affinity to the intercellular cement of the capillary wall by strengthening it and giving

it considerable protection against radiation ionization.

Niacin, biotin and folic acid in nutrition of the mouse EUGENE M. SPORN AND EDWARD J. SCHANTZ (introduced by HAROLD P. MORRIS) *Camp Detrick, Frederick, Md*

Extensive work on the nutrition of the rat has indicated that on a semi-synthetic ration, a dietary source of niacin, biotin or folic acid is not required for normal growth. Nieldson and Black (*J. Nutrition* 28: 203, 1944) reported biotin and folic acid deficiency in the mouse by feeding diets deficient in these vitamins. Others have obtained normal growth in mice without these factors in the ration. It was observed in his laboratory that weanling Swiss-Webster mice started at 19 days of age on a nutritionally complete diet containing 10 crystalline members of the vitamin B-complex grew at an excellent rate while mice on a diet deficient in niacin, biotin and folic acid grew at a slower rate. The difference became statistically significant after 6 weeks. The complete ration resulted in an average weight gain of 3.1 grams/week while the biotin-deficient ration resulted in 2.5 gm gain per week. Feeding rations deficient in each of the 3 vitamins demonstrated that only a biotin deficiency produced a similarly reduced rate of growth. There were no gross symptoms observed in the biotin-deficient mice aside from a decreased food intake and decreased growth rate. Bioassay of the livers of these animals indicated a slightly lesser store of biotin than in mice fed a complete ration.

Vitamin B₁₂ and folic acid for reproduction and lactation BARNETT SURE *Dept of Agricultural Chemistry, Univ of Arkansas, Fayetteville*

This work was carried out on the Wistar Strain albino rat. A ration containing 50% low-fat soybean flour furnished 25% proteins in rations, which were adequate in all dietary essentials except folic acid and vitamin B₁₂. *Ration A* was the control without folic acid and vitamin B₁₂; supplementation, *ration B* was supplemented with vitamin B₁₂; *ration C* was fortified with folic acid, and *ration D* was supplemented with folic acid and vitamin B₁₂. During a reproduction period of about 4 months the results obtained made it apparent that for optimum reproduction and lactation both folic acid and vitamin B₁₂ are essential and that folic acid plays a significant role in fecundity. Male rats from mothers on *ration B* weighed after 8 weeks growth, 109 gm more, and female rats weighed 46 gm more than rats from mothers on *ration A*.

Nutritional status of pteroylglutamic acid in persons with leukemia MARIAN E. SWENDESD, JR.

ANN L SWANSON, STANLEY MILLER AND FRANK H BETHELL (introduced by HOWARD B LEWIS)
Thomas Henry Simpson Memorial Inst for Med Research, Univ of Michigan, Ann Arbor

The clinical evaluation of metabolic antagonists of pteroylglutamic acid (PGA) in leukemia has shown that limited therapeutic benefit is obtained in many cases of acute leukemia, whereas the results of treatment in chronic leukemia are in general unsatisfactory. The possibility exists that the early development of toxic manifestations during PGA antagonist therapy in chronic leukemia may be conditioned by the nutritional status of the patient with respect to PGA itself. To determine whether PGA deficiency is associated with any specific type of leukemia, patients were given test doses of PGA and the urinary excretion of the vitamin measured. Since previous studies have indicated that untreated pernicious anemia patients, who are presumably deficient in PGA, excrete a much smaller percentage of test doses of the vitamin than normal subjects, it appears that the amount of PGA excretion following its administration may serve as a valid criterion of nutritional PGA status. Data show that low excretion rates of PGA following a 5 mg oral dose were obtained in chronic leukemia much more frequently than in acute leukemia. Seventy % of the chronic leukemia patients excreted less than 1 mg of the administered vitamin. The excretion of PGA antagonist (Aminopterin) was also less in chronic than in acute leukemia. Preliminary investigations of the converse problem, the effect of PGA antagonist administration on PGA nutrition and metabolism, have also been made. Data obtained by PGA and *L citrovorum* factor excretion studies during or after PGA antagonist (Aminopterin) therapy give some indications of PGA displacement from body tissues.

Unidentified factor for mink present in hog intestinal mucosa S B TOVE,* R J LALOR* AND C A ELVEHJEM *Dept of Biochemistry, College of Agriculture, Univ of Wisconsin, Madison*

Previous work has shown that when a regular sucrose-casein purified ration is fed to mink, loss of body weight and death will occur unless fresh liver is added to the diet (SCHAEFER, TOVE, WHITEHAIR AND ELVEHJEM *J Nutrition* 35 157, 1948). It was also demonstrated that the liver supplies 2 unidentified factors, one of which is soluble in 60% methanol, the other insoluble. Even when these animals are given rations containing 20% liver they suffer a severe weight loss and die after several months on experiment. Upon autopsy, dilation of the right side of the heart, marked fatty degeneration of the liver, kidneys and heart is noted. When 2% desiccated hog mucosa is added

to the basal ration supplemented with fresh liver an immediate gain in body weight results. No further weight loss occurs and the survival time is increased to at least 2 years. When killed at this time, the heart and kidneys appear normal, but a slight fatty degeneration of the liver is still apparent. When the hog mucosa is autoclaved at 15 pounds for 15 minutes the activity is destroyed. Unless given with fresh liver or fresh spleen the hog mucosa is inactive. Neither fresh spleen nor fresh spleen and hog mucosa is capable of replacing either of the 2 unidentified factors in liver. These results indicate that mink require a factor produced by a combination of hog intestinal mucosa and fresh liver or hog intestinal mucosa and fresh spleen.

Studies on the requirements of the mouse for some of the B vitamins JOHN J TRAVERS* AND LEOPOLD R CERECEDO *Dept of Biochemistry, Fordham Univ, New York City*

Long-term studies on growth, maintenance, reproduction, lactation and longevity in mice on high and low levels of the B complex were conducted to determine the minimum levels necessary for optimal performance. The diets used consisted of vitamin-free casein, sucrose, hydrogenated cottonseed oil, lard, ruffex, and salts, supplemented with thiamine, riboflavin, pyridoxin, pantothenic acid, folic acid, biotin, choline, a-tocopherol, and vitamins A and D. With a diet of this basal composition it was found that thiamine, riboflavin and pyridoxin, each at a level of 2.5 mg/kg of diet, allowed approximately the same overall performance as levels of 20 mg each. Swiss albino mice have been carried successfully through 4 generations on these diets. With C57 mice these diets were adequate for growth but not for reproduction and lactation. With low levels of thiamine the initial growth response in weanlings depends on the levels of the other vitamins, and there appears to be an interrelation between riboflavin and pyridoxin. When all three of these vitamins were given at 1 mg/kg of diet, approximately 50% of Swiss mice developed the typical acrodynia of pyridoxin deficiency. This is in contrast to what occurs with pyridoxin-free diets in the same strain when the levels of thiamine and riboflavin are high since under these conditions the syndrome is obtained only when desoxypyridoxin is employed.

Vitamin B₁₂ and liver protein regeneration HARRY M VARS, GORDON M KARN* AND COLIN C FERGUSON * *Harrison Dept of Surgical Research, Univ of Pennsylvania, School of Medicine, Philadelphia*

Adult male rats reared on a Purina diet were fed a nonprotein diet for 2 weeks, and subjected to a 70% partial hepatectomy. During a 2-week

postoperative period suitable groups were fed diets containing no protein, 10 or 18% casein and 10% wheat gluten, with and without the subcutaneous or intraperitoneal injection of a total of 4-10 γ of Cobione. There were no essential differences between treated and untreated groups in the N-balance, food intake, weight restoration and liver protein regeneration. A similar experiment was conducted with rats (obtained from Dr Gladys Emerson of the Merck Inst.) that had been fed a soya protein diet, free of animal protein factor for periods of 8-13 months. After 2 weeks on a non-protein diet and partial hepatectomy they were fed the same soya diet for 14 days, with and without injection of Cobione. The *ad libitum*-fed B₁₂ treated rats regained more in body weight and regenerated as much liver protein (slightly less positive N balance) than the untreated controls. The B₁₂-treated controls, pair fed to the untreated controls regained the same amount of body weight but regenerated less liver protein and had a smaller positive N-balance. Under the experimental conditions employed vitamin B₁₂ has evidenced little or no stimulatory effect in facilitating liver protein regeneration.

Protein metabolism in chronic illness effect of protein supplementation on nitrogen balance, hemoglobin, serum proteins and weight in the malnourished and effect of nutritional status on nitrogen storage S O WAIFE, MICHAEL G WOHL, JOHN G REINHOLD (introduced by JAMES H JONES) *Nutrition Project and Dept of Medicine, Philadelphia General Hospital, Philadelphia, Pa*

This study is an attempt to answer 1) Of what value is continued protein supplementation to the chronically ill patient? 2) What is the effect of a high protein intake on body weight, hemoglobin, serum albumin and globulin levels in these subjects? Twelve chronically ill, 'protein-depleted' subjects were studied by nitrogen balance methods for an average of 50 days (range 22-124 days). On a diet adequate in calories and with the protein intake supplemented by an oral casein concentrate, large amounts of nitrogen were stored. As an example, an elderly woman with rheumatoid arthritis, stored over 6 gm of nitrogen/day for 4 months. In 6 subjects nitrogen retention nearly equalled nitrogen intake. The nitrogen retention in 4 other patients was only moderately increased. This difference was undoubtedly due to a difference in degree of nitrogen depletion. There was no correlation between increased stores of nitrogen or rate of storage and changes of hemoglobin, albumin, globulin or weight. Clinically, the latter group is indistinguishable from the former except diabetic patients required significantly less insulin. Further work is needed to distinguish this

group in order to avoid useless and indiscriminate protein supplementation. The severely depleted patients showed a greater gain in weight and, to a less extent, a greater rise in globulin than the patients with a moderate nitrogen depletion. The latter group had the greater rise in hemoglobin and albumin. Protein metabolism in chronic illness differs significantly from that in acute illness in previously well subjects. The degree of repletion determines the type and degree of protein fraction which may be altered on supplementation.

Spectrographic evidence of deficiency of unsaturated fatty acids in serum and tissues of dogs on a low fat diet HILDA F WIESE,* RALPH T HOLMAN* AND ARILD E HANSEN *Dept of Pediatrics, Univ of Texas Med Branch, Galveston, and Dept of Biochemistry and Nutrition, A and M College of Texas, College Station*

Marked gross changes in the appearance of the skin and hair develop when young puppies are reared on a diet containing about 1% of the calories as fat. Lipid analyses of both the serum and skin tissue of these animals show that the fatty acids in these animals have a definitely lower degree of unsaturation compared with the fatty acids of the serum and healthy skin of dogs receiving 29% of their calories as fresh lard. The relative amount of unsaturated fatty acids having 2, 3, 4, 5 and 6 double bonds has been determined by measuring the absorption coefficient of the alkali conjugated fatty acids at 2350 Å, 2700 Å, 3025 Å, 3500 Å and 3750 Å. These values show definitely lesser amounts of diene conjugated fatty acid in the serum, skin and subcutaneous tissue of the animals exhibiting the characteristic skin changes of dietary fat deficiency than in healthy animals.

Microbiological characterization of biocytin LEMUEL D WRIGHT, EMLYN L CRESSON,* KATHERINE VALENTIK* AND HELEN R SKEGGS* *Med Research Division, Sharp and Dohme, Inc, Glenolden, Penna*

The isolation from yeast extract of a crystalline factor, termed biocytin, that is available to *Lactobacillus casei* but not to *Lactobacillus arabinosus* as a source of biotin recently has been announced (WRIGHT, CRESSON, SKEGGS, WOOD, PECK, WOLF AND FOLKERS *J Am Chem Soc* In press). Biological characterization of biocytin is extended by data with respect to 1) availability as a source of biotin to a large group of biotin-requiring organisms and unavailability as a source of biotin to only a few species, 2) stability to the action of any one of a large number of commercial enzyme preparations, 3) avidin combinability, 4) relative inactivity as compared to biotin in reversing the bacteriostatic activity of certain biotin antimetabolites, and 5) inactivity

as compared to biotin in stimulating the aspartic acid deaminase activity of bacterial cells previously exposed to pH 4 M phosphate buffer. Biocytin from chromatographic data appears to be the only complex in yeast extract capable of yielding, by acid hydrolysis, biotin or its microbiological equivalent for lactic acid bacteria.

Effects of dietary supplements on plasma tocopherol levels and vitamin E deficiency symptoms in chicks LEONA ZACHARIAS, PAUL GOLDHABER AND V. EVERETT KINSEY (introduced by FREDRICK J. STARE) *Massachusetts Eye and Ear Infirmary and Harvard Med School, Boston, Mass.*

The influence of a water-miscible vitamin preparation (Vi-Penta), iron, and other substances on vitamin E deficiency symptoms and plasma tocopherol levels of chicks fed various diets was investigated. The chief symptom of deficiency in chicks fed a vitamin E deficient base diet was encephalomalacia. The plasma tocopherol level was 0.1–0.4 mg %. Oral administration of 21 mg of α -tocopherol weekly to chicks fed the base diet

prevented deficiency symptoms and raised the plasma tocopherol level to 1.5 mg %. Chicks fed a natural diet, with or without cod liver oil, developed no deficiency symptoms, although their tocopherol level was in the same low range (0.1–0.5 mg %) as that of animals fed the base diet. Oral administration of iron supplements did not alter the plasma tocopherol levels. Although addition of Vi-Penta to the tocopherol-supplemented base diet lowered the plasma tocopherol level, it prevented deficiency symptoms when added to the unsupplemented base diet. The absence of vitamin E-deficiency symptoms in chicks raised on a cod liver oil-supplemented natural diet or a Vi-Penta-supplemented base diet (both diets containing inadequate amounts of vitamin E and significant quantities of unsaturated fatty acids) suggests the presence of protective substances other than vitamin E in both the natural diet and Vi-Penta. The use of water-miscible vitamin preparations or iron does not contribute to the production of a state of vitamin E deficiency in chicks. The relation of these findings to retrolental fibroplasia in premature infants is discussed.

THE AMERICAN ASSOCIATION OF IMMUNOLOGISTS

Thirty-fourth Annual Meeting

ATLANTIC CITY, NEW JERSEY, APRIL 17-21, 1950

(An asterisk * following an author's name indicates "by invitation")

Immunochemical studies on species differences among blood group A substances HAROLD BAER,* ELVIN A KABAT, RICHARD L DAY* AND VESTA KNAUB * *Depts of Neurology, Bacteriology and Pediatrics, Columbia Univ College of Physicians and Surgeons, and the Neurological Inst and Babies Hospital, Presbyterian Hospital, New York City*

Substances showing blood group activity are found in tissues and secretions of many animals, such substances have been found in human, hog, horse and cattle stomach linings. Not every member of each species possesses all blood group activities. Isolation has revealed that materials of comparable immunochemical purity from different species showing a given blood group activity are not identical. Thus, hog substances varied in methylpentose content from 6-13%, while substances from human saliva varied from 9-18%, those from horse stomachs averaged 7% and those from cattle stomach ranged from 1.5-5.2%. The horse blood group substances contained more non hexosamine nitrogen than did substances from other species. The reactions of hog, human and horse blood group A substances with homologous and heterologous antisera formed in man as measured by the hemagglutination inhibition and quantitative precipitin methods provide further evidence of species differences. Hog and human A substances are very closely related as evidenced by their high cross reactivity while horse A substance cross reacts much less with antisera to both hog and human A substance. Analysis for hexosamine in specific precipitates of hog and human A substances with antibody to human A substance formed as a consequence of heterospecific pregnancy has shown that within experimental error all of the hexosamine of the blood group substance is precipitated. This confirms the data on purity obtained with antibody prepared against purified hog A substance.

Antibody production in nutritionally depleted patients HENRI H BALCH (introduced by A M PAPPENHEIMER, JR) *Depts of Surgery and Microbiology, New York Univ College of Medicine, New York City*

There have been reports, based largely on animal experiments, that nutritional deficiency and loss of the protein reserve may lead to a lowered resistance to infection. This lowered resistance is said to be due in part to deficient antibody formation. Antibody production has usually been measured by using the agglutination or hemolytic reactions. In the present study antibody response has been measured quantitatively in a group of patients nutritionally depleted by disease. This has been carried out by determining the anamnestic response to a single injection of 42 Lf (0.12 mg) of highly purified diphtheria toxoid in Schick negative individuals showing no hypersensitivity to Schick control. Severely ill, nutritionally depleted patients, with hypoproteinemia and extensive weight loss, who were also in negative nitrogen balance, were found capable of producing antibody as well as or better than the healthy controls. (The series included 25 depleted and 19 healthy control patients.) Furthermore, antibody production was found to continue up to the time of death from wasting disease. Antibody response could not be related to the age of the patient, the initial antibody level, total serum protein, serum albumin or serum globulin levels. No relation was found between antibody response and the development of infection. This work clearly shows that conclusions based on experiments in animals may not apply in man, with respect to the relationship of the protein reserve to antibody globulin synthesis or to the need for adequate dietary protein for antibody manufacture in order to help prevent the onset and development of infection.

Factors aiding in the demonstration of qualitative differences in the virulence-enhancing activity of mucin preparations H C BATSON AND MARTHA BROWN * *Dept of Biologic Products, Army Med Dept Research and Graduate School, Washington, D C*

Previous observations indicated that qualitative differences in the activity of immunologically active substances could not be demonstrated with any certainty, if at all, when all controlled experimental conditions favored the action of

the substances being tested. However, it appeared that differences in activity of such substances could be demonstrated by the deliberate introduction of stress factors, i.e. unfavorable conditions. The investigation reported here was a study of the effect of various stress factors on the degree and certainty of differentiation between two lots of mucin of different virulence enhancing activity. Stress factors investigated included mouse resistance, virulence of the challenge organisms (*Salmonella typhosa*), and specific immunization, both active and passive. Distinction between the lots of mucin was established with certainty when tested with moderate doses of a moderately virulent strain of *S. typhosa* in male mice of a moderately resistant strain. Distinction was not accomplished using comparable doses of a highly virulent strain of *S. typhosa* and female mice of a highly susceptible strain. Distinction between the mucins was readily accomplished by employing either actively or passively immunized mice even though they were of susceptible strain and sex and the *S. typhosa* challenge culture used was highly virulent. These observations are of critical interest in immunological assays since in determining the degree of protection conferred on susceptible mice by an active immunizing agent, the apparent immunogenic activity would be greatly exaggerated by the inadvertent use of a mucin preparation of low activity.

Immunochemical studies on cattle blood group substances SAM M. BEISER* AND ELVIN A. KABAT *Depts. of Bacteriology and Neurology, Columbia Univ. College of Physicians and Surgeons, and the Neurological Inst., Presbyterian Hospital, New York City*

Substances with either A, B, O, AO, BO, or with negligible activity as determined by hemagglutination-inhibition were prepared from individual cattle stomachs. The best cattle preparations are about 5% as active per unit weight as corresponding hog, human or horse preparations. These substances are antigenic in man resulting in the production of precipitins and some rise in hemagglutinins. Anti-cattle B formed in man precipitates all cattle preparations studied irrespective of their blood group activity, indicating that these products have bovine as well as blood group specificity. Hexosamine analyses on precipitates obtained in the region of antibody excess result in recovery of 59-90% of the bovine hexosamine added. In common with blood group substances isolated from hog and human sources, bovine substances cross-react with horse anti-S XIV. The degree of cross-reactivity is unrelated to the methylpentose content of the cattle substances, but the cross-reactivity increases on heating the preparations at 100°C for 2 hours

at about pH 1.9. Bovine blood group B substances cross-react extensively with antisera to horse B formed in man and show a much higher capacity to precipitate anti-B per unit weight than would have been expected from the hemagglutination-inhibition test. Cattle A does not cross-react with antibody to hog A or human A substances. The sera of two individuals of type B with a high natural anti-A titer precipitated with hog A but reacted only slightly with bovine A substance.

Immunochemical studies of bovine complement

DAVID T. BERMAN (introduced by M. R. IRWIN)
Depts. of Veterinary Science and Genetics, Univ. of Wisconsin, Madison

Fresh unheated bovine serum agglutinates sensitized erythrocytes. The agglutinative power may be inactivated by heating at 56°C for 20 minutes, by treatment with zymine, NH₃, or by fractionation into midpiece (M) and endpiece (E). Recombination of M and E, of heated serum with NH₃-treated or zymine-treated serum, and of zymine-treated serum with NH₃-treated serum restored the agglutinative ability. Alternative hypotheses to explain these results are 1) that bovine complement (C') is primarily agglutinative, or 2) that bovine serum contains a non-hemolytic complement which is fixed by sensitized cells, which are then agglutinated by 'conglutinin'. Specific inactivation of C' prevents 'conglutination'. The agglutinative power inactivated by treating a single lot of bovine serum with heat, zymine and NH₃ to destroy all four C' components, was not restored by combining this preparation with fresh horse serum. Specifically inactivated bovine serums were recombined with specifically inactivated guinea pig, human and rabbit C'. All effective combinations of these reagents produced agglutination of sensitized cells, and some also produced lysis. Inactive combinations generally could be explained on the basis of anti-complementary action of one of the reagents, or of the combination. Bovine reagents furnished C'1, C'3 and C'4 to the other specifically inactivated complements. From these results it appears that bovine C' consists of at least 4 components analogous to, and to some extent interchangeable with, those of other species of mammals. Bovine C' is primarily agglutinative, and this activity adequately explains the so-called 'conglutination' reaction, without the necessity of resorting to an additional serum factor.

Differences in surface structure between virulent and avirulent mycobacteria HUBERT BLOCH
Public Health Research Inst. of The City of New York, Inc., New York City

It was found recently (H. Bloch, *J. Exper. Med.* 91: 197, 1950) that a lipid material could be extracted from virulent but not from avirulent

tubercle bacilli, and that several biological functions of the bacilli related to virulence could be attributed to this material which is most likely coating the cellular surface of virulent organisms. Further investigations revealed considerable differences in the permeability of the cellular surface of virulent and avirulent mycobacteria. Using the Thunberg methylene blue method, it could be shown that avirulent variants of tubercle bacilli as well as saprophytic mycobacteria decolorize methylene blue in the presence of a substrate, as most bacteria do, whereas virulent organisms do not reduce the dye. This lack of reactivity is due to a considerable impermeability of the cellular surface which distinguishes virulent organisms. Removal of the lipid coating mentioned above by the action of organic solvents or of certain enzymatic factors promptly renders virulent organisms methylene blue decolorizing. Whereas avirulent mycobacteria reduce methylene blue at any age of the culture, virulent bacilli may acquire this property by aging. The time required for a virulent culture to become methylene blue-decolorizing is inversely proportional to its virulence.

Second attacks of poliomyelitis in human beings, in relation to immunity DAVID BODIAN AND HOWARD A. HOWE *Poliomyelitis Research Center, Dept of Epidemiology, Johns Hopkins Univ., Baltimore, Md*

It was shown that second paralytic attacks of poliomyelitis in monkeys result only from inoculation with strains of different antigenic type (BODIAN *Am J Hyg* 49 200, 1949). Even 3 attacks may be produced by viruses of the 3 known types, Brunhilde, Lansing, and Leon (BODIAN, MORGAN AND HOWE *Am J Hyg* 49 225, 1949). Leon virus heretofore was represented by one strain (Los Angeles, 1937), although there is evidence for a wider distribution of this type in the U.S. (BODIAN *Proc Soc Exper Biol & Med* 72 259, 1949). In September 1944, in Baltimore, we isolated fecal virus from a boy of 15 who was suffering a second attack, and whose first attack occurred at 9 months, leaving severe residual muscle atrophy. The virus has been shown to be of the Leon type. Antibody against Lansing, Brunhilde, and Leon viruses was absent from his serum at the time of the second attack. His serum 3 months later neutralized Leon, but not Lansing or Brunhilde. His serum neutralized his own virus somewhat, during the second attack, and had greater potency 3 months later. From the same outbreak, we isolated a virus of the Brunhilde type (Frederick strain, reference 2, above), so that more than one antigenic type was prevalent. Whether paralytic reinfection in man, as in monkeys, is due to infection with a second antigenic

type is not answered. Antibodies against the virus type of the first attack may have disappeared, or his first attack could have been due to a type not yet identified.

Relationship between serum antibodies and carrier state to poliomyelitis GORDON C. BROWN AND JOHN D. AINSLIE * *Dept of Epidemiology and Virus Lab, School of Public Health, Univ of Michigan, Ann Arbor*

Three families in which cases of poliomyelitis occurred were studied for the presence of virus in stools and serum antibodies. Eight adults and 14 children were represented. The specimens had been obtained shortly after onset and again 3 weeks later. Virus was isolated from stools by intracerebral inoculation of monkeys. Serum antibodies were demonstrated by virus neutralization techniques in mice against the Lansing strain and in monkeys against the virus isolated from the family under test. Poliomyelitis virus was isolated from all 5 cases and from 8 of 17 familial associates. With two exceptions, the positive isolations were from persons under 12. The individuals from whom virus was not recovered were all over 15. Two people remained carriers for 3 weeks. Only 3 of 12 carrying virus in stools were found to have Lansing antibodies. Two of these were cases. Of 9 associates with no virus in their stools, all had demonstrable serum antibodies, suggesting a close correlation between the presence of Lansing antibodies and the absence of virus in stools. This same correlation was observed with the later specimens. Sera of the cases and their associates were tested for neutralizing antibodies to the specific strains of virus recovered. Most of these sera contained antibodies to the specific 'family' virus as early as 3 days after onset of illness in the case, suggesting an early experience with the agent. These antibodies appear to exist regardless of the presence or absence of Lansing virus antibodies or of virus in the stools.

Further studies on the role of activated protease and protease-inhibitors in allergic reactions KENNETH L. BURDON *Dept of Microbiology, Baylor Univ College of Medicine, Houston, Texas*

An improved fibrinogenolytic technique which serves as well for the quantitative titration of activated serum proteases as for testing the activity of various protease-inhibiting substances, has been applied, in addition to the film-gelatin digestion procedure previously used, in the further study of the protease-antiprotease system in normal, sensitized and desensitized guinea pigs, rabbits and human beings. Critical tests on serum samples from guinea pigs sensitized to a pure, non-antitryptic antigen (crystalline egg albumin) using in parallel the highly sensitive fibrinogeno-

lytic technique and the fully standardized film method, with crystalline trypsin, have corroborated earlier findings, which indicated a marked disturbance of the protease-antiprotease balance during anaphylactic shock, and the regular association of the refractory state with a relatively high average antitryptic titer in the blood. Results of studies on the activation and titration of the blood proteases of normal and sensitized animals, and human beings, and of attempts to prevent systemic anaphylaxis and local allergic reactions by the administration of highly antitryptic substances are presented.

Effect of x-irradiation on enteric cholera and coproantibody response in the guinea pig WILLIAM BURROWS *Dept of Bacteriology and Parasitology, Univ of Chicago, and Biology Division, Argonne Natl Lab, Chicago, Ill*

Experimental enteric cholera in the guinea pig was significantly altered by x-irradiation in doses of 100-200r. Animals were infected by intragastric inoculation immediately following irradiation, and 4-5 were killed on alternate days thereafter for a period of 20 days, and examined for bacterial infection of the tissues. Eighty % were infected after the 5th day, and of these hemolytic streptococci were found in 24%, staphylococci in 24%, and cholera vibrios in 52%. Assay of the cholera infection by count of vibrios excreted in the feces showed a marked suppression in the first 1-3 days, followed by a sharp increase in the intensity of the infection by the 5th-10th day which was 5-fold or more than that in the non-irradiated animal and corresponded in time with the spread of infection from the bowel. Serum antibody response was negligible but titration of coproagglutinin showed an accelerated immune response immediately following infection, reaching a peak at the 2nd-3rd day, and its disappearance by the 5th day associated with the increase in numbers of vibrios excreted. The results suggest that x-irradiation produces a transitory acceleration in coproantibody response, that the relation between coproantibody titer and intensity of enteric infection is inverse, that x-irradiation results in generalized spread of enteric cholera, and that disappearance of coproantibody is associated with invasion of the tissues by bacteria present in the bowel in radiation sickness.

A method for the enhancement of hypersensitivity to a simple chemical substance (picryl chloride) MERRILL W CHASE *Rockefeller Inst for Med Research, New York City*

While the methods for inducing cutaneous sensitivity towards chemical allergens usually necessarily involve application of the simple chemicals to the skin, typical contact-type hypersensitivity has been elicited in guinea pigs by means of the

intraperitoneal injection of special conjugates (prepared by coupling the simple excitants to homologous erythrocyte stromata) along with dead tubercle bacilli and paraffin oil (LANDSTEINER, K AND M W CHASE *J Exper Med* 73 431, 1941). The described method may be simplified technically by making at one time several small intramuscular injections of an emulsion of conjugate, Aquaphor or Falba, and paraffin oil containing killed mycobacteria (CHASE, M W *J Exper Med* 86 489, 1947). When picrylated stromata are thus employed as sensitizer, a large proportion of the animals develop sensitiveness to picryl chloride, the limiting reactive concentrations in olive oil varying between 1:100 and 1:500, infrequently 1:1500. This degree of sensitiveness may be further increased between 10- and 30-fold, approaching the drug-sensitiveness (by contact) of human beings, when applications of picryl chloride in dibutyl phthalate or almond oil are made to the skin at a few appropriately spaced times following the initial intramuscular sensitizing injection. Distinct reactions occurred at 1:15000 concentration in 45% of 283 animals so treated and at 1:45000 in 14.2% of 147 animals. Neither of the two types of treatment alone, nor restimulation with the conjugate, sufficed.

A precipitin test for carbohydrate antibodies in human tuberculosis and in leprosy NINE CHOU-CROUN *Dept of Public Health and Preventive Medicine, Cornell Univ Med College, New York City*

A precipitin test for carbohydrate antibodies in human tuberculosis has been obtained. The precipitating agent is the water soluble carbohydrate, which is split, by hydrolysis, from the antigenic lipo-carbohydrate that we have extracted from the tubercle bacillus. This same polysaccharide gives also a precipitin reaction with the sera of leprosy patients. More than 300 cases of active and inactive tuberculosis have already been studied on a qualitative basis. The clinical classification of these cases seem to indicate that carbohydrate antibodies are more prevalent in tuberculous patients that are successfully fighting against the disease, than in those patients in whom the infection is progressing rapidly. They also show that antibodies remain present, for a certain period of time, in the sera of patients who have apparently overcome the disease (from the clinical point of view). In leprosy, where more than 100 cases have been studied, these carbohydrate antibodies seem to be more prevalent than in tuberculosis. As a control for the specificity of the test, a large number of sera from a variety of other infections have been tested. The only significant crossreaction that has been obtained is with leprosy and this reaction is

demonstration that the tubercle bacillus and the leprosy bacillus are closely related chemically

Use of I^{131} label for measurement of serum antibody SIDNEY COHEN (introduced by MONROE J SCHLESINGER) *Yamms Research Lab, Beth Israel Hospital and Dept of Medicine, Harvard Med School, Boston, Mass*

Pressman (*J Immunol* 59 141, 1948) using I^{131} has iodinated antisera with 4 iodine atoms per molecule of protein without obvious loss of reactivity of the serum. The application of such a procedure to the determination of serum antibody by measurement of radioactivity is being studied. A preliminary investigation has been made using the diphtheria toxin horse antitoxin system. Equine antitoxic sera have been labelled in the proportion of one iodine atom to 4 or 5 molecules of globulin. After adequate dialysis all of the residual iodine is precipitable by trichloroacetic acid. The I^{131} content of washed toxin antitoxin floccules has been determined and the antibody nitrogen calculated using the ratio of I^{131} to protein nitrogen obtained for the iodinated serum. Results obtained in this way fall 6-8% below those obtained by standard Kjeldahl methods. The zone of flocculation of iodinated antitoxin is very nearly the same as the original serum. Iodinated normal (non-immune) serum protein is not appreciably adsorbed by toxin-antitoxin floccules.

Enumeration of elementary particles of the virus of meningo-pneumonitis T TIMOTHY CROCKER (introduced by JOSEPH L MELNICK) *Dept of Physiological Chemistry and Section of Preventive Medicine, Yale Univ School of Medicine, New Haven, Conn*

Direct counting of elementary particles of the virus of meningo pneumonitis (a member of the psittacosis lymphogranuloma venereum group) within a standard error of the determination of about 10% has been accomplished by application of the technic of Williams and Backus. These workers introduced the use of latex spheres of nearly uniform diameter in suspensions of known concentration in making similar determinations for certain plant viruses. The method includes counting of latex particles and virus particles in limited fields in the electron microscope. Calculation of virus particle concentration is made from the ratio of the two types of particles counted and the known concentration of the latex spheres in a mixture of suspensions of the two particles. This method permits morphologic identification of the virus during counting and yields determinations of virus concentration more accurately than does biologic titration. Problems arising from application of this technic to an animal virus infectious for laboratory workers have been taken

into account. An investigation of morphologic and biologic alterations produced in the virus by heat, ultraviolet radiation, and chemical fixation has been directed toward development of safety without loss of accuracy in these determinations.

Chemical determination of histamine in blood of infants and children with special reference to rheumatic fever PAUL F DE GARA *New York Hospital and the Dept of Pediatrics, Cornell Univ Med College, New York City,*

Increase in the histamine level has been noted in connection with immunological reactions. Some observers have also reported an increase during certain phases of acute allergic conditions. These observations were made using various modifications of a bioassay procedure which is not readily adaptable to serial studies. Since an allergic factor in the etiology of rheumatic fever has been stressed by some observers, a study of blood histamine levels during the various phases of this disease and a comparison of the results with those found in normal individuals and in patients with allergic conditions was undertaken. A chemical method for the determination of the small amounts of histamine present in normal human blood has been described by Lubschez (*J Biol Chem* In press). The histamine in 5-10 ml of whole blood is isolated, and the solution is concentrated and analysed colorimetrically using a diazonium reagent. Using this method, blood from 10 normal children and 50 patients with active or inactive rheumatic fever, bronchial asthma, eczema, rheumatoid arthritis and miscellaneous other diseases was analysed for histamine. The influence of ACTH upon the blood histamine level was also investigated. The results obtained are presented and discussed.

Effect of sensitization and irradiation on the fate of I^{131} -labelled bovine gamma globulin in rabbits and mice F J DIXON,* G J DAMMIN* AND S C BUKANTZ *Depts of Pathology and Internal Medicine, Washington Univ School of Medicine, St Louis, Mo*

This study was undertaken to determine the effect of sensitization and irradiation on the fate of antigenic protein injected into rabbits and mice. Bovine gamma globulin was iodinated and traced according to a modification of the technique previously described by Warren and Dixon (*Am J M Sc* 216 136, 1948). Three groups of rabbits were injected intravenously with 500 mg of I^{131} labelled bovine gamma globulin. The first group had been sensitized 20 days earlier by intramuscular injection of 350 mg of alum precipitated bovine gamma globulin, the second had been exposed two days before injection to 500r of x-ray, and the third group consisted of non-sensitized controls.

Radioactivity levels of blood, tissues, and excreta were determined during a nine-day period. The most significant changes after injection of the I^{131} labelled protein were: 1) A loss of radioactivity from the blood stream of all animals, most rapid in sensitized. At 96 hours less than 1% of the original injected activity was still present in the blood of sensitized animals, while controls and γ -rayed animals had 8% and 7% respectively. 2) Liberation of I^{131} from the protein-bound state, most rapid in sensitized animals. This liberation resulted in the appearance of non-protein bound I^{131} in the blood. 3) Appearance of non-protein bound I^{131} in the urine, in 96 hours accounting for approximately three-fourths of total injected activity in sensitized animals, and approximately one-half in γ -rayed animals and controls. 4) A higher level of tissue-bound radioactivity in sensitized animals than in other groups.

Specific localization of anti-rat-lung serum as determined by the use of radioactive tracers
HERMAN N. EISEN* AND DAVID PRESSMAN
Sloan-Kettering Inst. for Cancer Research, New York City

Anti-rat-lung serum and antiovalbumin serum, prepared in rabbits, were fractionated and the globulin fractions labelled with radioiodine (I^{131}). These materials were each injected into rats and the distribution of radioactivity served as an indication of the distribution of antibody. It was found that rats injected with radioactive anti-lung serum exhibited specific localization of radioactivity in their lungs, and also in their kidneys. Although the localization in kidney of anti-lung serum was quite similar in extent to the localization of anti-kidney serum, the localization in lung was quite different for the two antisera. It appears from these results that there are substances in lung which are different serologically from any components in kidney, and that there are other substances in lung and kidney which are similar, or perhaps identical, and which are the antigens responsible for the development of kidney-localizing antibody. Since we previously showed that nephrotoxic factor in anti-kidney serum is probably identical with the kidney-localizing antibody of this antiserum, the kidney-localizing activity of anti-lung serum was compared with that of anti-kidney serum. The former, like the latter, localized clearly in glomeruli (radioautography), decayed in kidney tissue with a 'half-life' of about 20 days, and was absorbed *in vitro* by a fraction of kidney homogenate which was insoluble in NaCl solution and in alcohol, acetone and ether. In light of these extensive similarities it is interesting to know that anti-lung serum has been reported to produce, in rabbits, a nephritis which is indistinguishable from that induced by anti-kidney serum.

Serological studies on infectious mononucleosis and viral hepatitis with human erythrocytes modified by different strains of Newcastle disease virus
ALFRED S. EVANS (introduced by JOHN R. PAUL)
Section of Preventive Medicine, Yale Univ. School of Medicine, New Haven, Conn.

Serological reactions with human erythrocytes modified by adsorption and elution of a Connecticut or an Australian strain of Newcastle disease virus (NDV) have been studied to investigate the effect of strain differences in NDV on the results of agglutinative tests performed with serum from patients with various infectious diseases. Serum from 13% of 59 cases of infectious mononucleosis agglutinated Rbc modified by the Connecticut strain of NDV in higher titer than found in serum of normal individuals whereas serum from 74.5% of these same cases agglutinated Rbc similarly modified by an Australian strain. Individual titers were often much higher with the Australian strain. Adsorption experiments indicate that Rbc modified by either strain react with the same component of serum. Elevated titers were found in serum from 32% of 40 patients with viral hepatitis using Rbc altered by the Connecticut strain of NDV and in 26% of 90 cases studied with the Australian strain. Thirteen per cent of serum from patients with other infectious diseases had elevated titers with the Connecticut strain and 10% using the Australian strain. The capacity of virus modified Rbc to agglutinate fresh Rbc, the hemagglutination titer against chicken and human Rbc, and the infectivity titer for eggs were all closely comparable for these strains as well as for 2 other strains of NDV. When subjected to elevated temperatures differences in the stability of the hemagglutinin of these 4 strains were demonstrable.

Observations on factors influencing the diagnostic agglutination titration in brucellosis
RICHARD J. FEINBERG,* GEORGE G. WRIGHT AND WERNER BRAUN *
Biological Dept., Chemical Corps, Camp Detrick, Frederick, Md.

The method of antigen preparation and the time and temperature of incubation were observed to influence specificity and sensitivity in diagnostic brucella agglutination titrations. Serums from patients with brucellosis and cross reacting serums from persons recovered from tularemia and from persons immunized against cholera were used. The agglutination titers of these serums were similar when tested with 22 smooth brucella strains of different origin and characterized by different dissociation indices. Five methods of tube test incubation were studied. Tests were performed with heat, phenol and formalin killed antigens incubated at 24° C, 37° C, 45° C, 53° C, and 60° C for 4, 8, 16, and 32 hours. Phenol killed and heat killed antigens gave identical titers in

cases of active and convalescent brucellosis. In cross reacting serums, however, the titers were much lower at 53° C or 60° C than at lower temperatures of incubation. Experiments in which the antiserums and bacterial suspensions were heated separately at 53° C before titration suggested that inactivation of antigen or antibody did not occur at this temperature and therefore was not responsible for the reduction of cross reacting titers. With formalin killed antigens the cross reacting serums failed to show any difference in agglutination titer at different incubation temperatures. Prozones with serums from recovered persons were enhanced by the use of formalin-killed antigens. Serums from certain recovered persons agglutinated phenol and heat killed antigens at all temperatures studied but titers appeared to be temperature-dependent if formalin-killed antigens were used.

Relationship between serum protein fractions and antibody nitrogen response in diabetes mellitus

JOHN A. FLICK, SIGMUND KETTERER,* MICHAEL G. WOHL* AND S. O. WAIFE* (with technical assistance of GEORGE CLOUGH) *Dept. of Bacteriology, Univ. of Pennsylvania School of Medicine and Philadelphia General Hospital, Philadelphia*

The object of this study was to determine whether or not any relationship exists between the antibody response following typhoid vaccination and the concentration of some serum protein fraction in diabetic patients. Twenty six hospitalized diabetic patients were studied chemically and immunologically for a period of 30 days. Various serum protein fractions and the typhoid antibody concentration were determined chemically at intervals. The results were correlated and statistically analyzed. The data suggest the following conclusions: 1) Diabetic patients with hypoalbuminemia of less than 4 grams % showed a lower typhoid antibody response as measured by the antibody nitrogen concentration than a comparative group of normo-albuminemic diabetics having serum albumin levels above 4 grams %. 2) Diabetic patients with a serum globulin value of over 3 grams % had a slightly higher antibody response than patients showing a globulin level of below 3 grams %. 3) No significant difference in antibody response was found in patients with high gamma globulin as compared with those having normal gamma globulin values. 4) The highest antibody responses were found in patients with normal albumin and high gamma globulin values.

High-intensity electrons as a tool for preparation of vaccines. I. Preparation of rabies vaccine

ULRICH FRIEDEMANN,¹ FREDERICK B. TRAUB AND WOLFGANG HUBER* *Dept. of Bacteriology,*

Jewish Hospital of Brooklyn, and Research Labs., Electronized Chemicals Corp., Brooklyn, N. Y.

The experiments presented are a first attempt to use corpuscular radiation in the preparation of vaccines. High intensity ultra-short time electron bursts produced by a 3 MeV Capacitron were used for the inactivation of rabies virus. The Capacitron releases intensities of several million 'rep' (Roentgen Equivalent Physical) during one micro-second. The selective effect of this type of radiation on nucleic acids and the independence of the radiation treatment from temperature and type of medium, make it particularly attractive for the preparation of potent and stable vaccines. The rabies vaccine was prepared as a 5% suspension of mouse brains in nutrient broth and irradiated with 1,500,000 rep in the frozen state. The phenol vaccine was prepared from the same virus in the usual way. Potency tests were performed on mice, using the homologous strain as challenge virus. The results were expressed as 'protection' in LD₅₀. A number of irradiated vaccines prepared under various conditions protected against 2,540-250,000 LD₅₀, while the phenol vaccines protected against 61-3,120 LD₅₀. It is therefore apparent, that a potent antirabies vaccine can be prepared with the aid of corpuscular radiation.

Observations on agglutination of polysaccharide-treated erythrocytes by human tularemia antisera

T. W. GREEN,* GEORGE G. WRIGHT, MARY M. ALEXANDER* AND JANET JOHNSON* *Biological Dept., Chemical Corps, Camp Detrick, Frederick, Md.*

Human Type O erythrocytes treated with a polysaccharide obtained by phenol extraction of *Pasteurella tularensis* become specifically agglutinable by sera from human tularemia. The reaction resembles virus hemagglutination and is most easily detected by observing the pattern of settling in the bottom of the tube. Hemagglutination titers reached 1-10,000 in sera from recently recovered tularemia patients. Sera from persons immunized with tularemia vaccines also show the reaction, but to a lower titer. The method is simple and convenient and requires only a small amount of serum. The hemagglutination titer appears to be correlated with the amount of antibody as measured by the quantitative precipitin reaction with polysaccharide, but not with the bacterial agglutination titer. In the tularemia cases studied hemagglutination titers increased more rapidly and abruptly than bacterial agglutination titers. The hemagglutination reaction also showed less tendency toward cross reaction with sera from brucellosis than did the bacterial agglutination titration.

¹ Deceased

Hemagglutination by meningopneumonitis virus and its inhibition by immune sera D A HAIG* AND M R HILLEMANN *Dept of Virus and Rickettsial Diseases, Army Med Dept Research and Graduate School, Washington, D C*

Allantoic fluid from embryonated eggs infected with meningopneumonitis virus contains a specific hemagglutinin which aggregates mouse erythrocytes but not the red cells of a number of other species of mammals and birds. Agglutination occurs when the tests are incubated at 26–37° C but not at 4° C. This hemagglutinin found in allantoic fluids infected with meningopneumonitis virus is specifically inhibited by convalescent or immune sera of chickens, pigeons, rabbits or human beings infected with meningopneumonitis, ornithosis, feline pneumonitis or mouse pneumonitis viruses. Thus, the hemagglutination-inhibition test, like the complement-fixation test is specific for the psittacosis-lymphogranuloma venereum group of agents but is not type-specific for the individual viruses. Preliminary studies suggested that the infectivity and hemagglutinating activity found in allantoic fluids from inoculated eggs are not identical. Fluids which contain hemagglutinin and elementary bodies and possess high infective titers have a greatly reduced number of intact virus particles after centrifugation at about 13000 RPM but still possess essentially undiminished hemagglutinin. The nature of this hemagglutinin is being investigated. The hemagglutination test with the members of the psittacosis-lymphogranuloma venereum group should be useful in studies on the sera of domestic fowl which fail to react in the ordinary complement-fixation test.

Anti-reaginic action of normal rabbit serum MARGO HASSON* AND M SCHERAGO *Dept of Bacteriology, Univ of Kentucky, Lexington*

In the course of an investigation of the antigenicity of human atopic reagin from two ragweed sensitive hay fever patients we found that although the sera from the rabbits that were injected with the reaginic sera prevented the reagin to some extent from passively sensitizing the skin of non-allergic recipients, sera from normal rabbits had a similar, though not as potent, antagonistic action. A more detailed study of this antagonistic action of normal rabbit serum on two additional human reaginic sera (one from a ragweed sensitive hay fever patient and the other from a rabbit dander sensitive hay fever patient) was made, using unheated and heat inactivated rabbit sera. Samples of rabbit sera from 2 months old, one year old, and 1½-year-old males and from 1½-year-old females were used. Although both samples of the reaginic sera were inhibited by the normal rabbit sera the one from the ragweed

sensitive patient was completely inhibited only after it had been diluted 1–80, whereas the one from the rabbit dander sensitive patient was completely inhibited in even as low a dilution as 1–10. Inactivation of the rabbit sera at 56° C for 30 minutes had no significant effect on their antireaginic action.

Serological reactivity of dextran plasma substitute EDWARD J HEHRE* AND JOHN Y SUGG *Dept of Bacteriology and Immunology, Cornell Univ Med College, New York City*

Specimens of partially hydrolysed dextran, prepared in Sweden for use as a plasma substitute, were found to possess *in vitro* serological activity and also the capacity to produce anaphylactic shock in guinea pigs passively sensitized with an appropriate antiserum. We had previously shown (*J Immunol* 43 119, 1942) that unhydrolysed dextrans synthesized by *Leuconostoc mesenteroides* give precipitation and complement fixations reactions not only with leuconostoc antiserum but also with antisera of type 2 and type 20 pneumococci. Swedish (Pharmacia) dextran for infusion obtained in 1946 and 1949 likewise reacted with types 2 and 20 pneumococcus antisera. Precipitation occurred over a somewhat more narrow range of polysaccharide and serum dilutions than in the case of a native dextran, but complement fixation was obtained with definitely higher dilutions of the partially hydrolysed than of the native polysaccharide. Intravenous injection of 0.1 mg or 0.2 mg of any of the samples of Swedish dextran into guinea pigs previously sensitized with a potent type 2 pneumococcus antiserum invariably caused acute fatal anaphylactic shock. Intravenous administrations of large amounts of dextran into many people without untoward reaction have been reported. Nevertheless, the antibody-combining properties of dextrans should be recognized as a theoretical source of danger in the case of persons who might possess a high titer of appropriate antibodies at the time of injection.

Interrelationships of crystalline egg albumin and its deaminated and denatured derivatives MICHAEL HEIDELBERGER AND PAUL H MAURER* *Depts of Biochemistry and Medicine, Columbia Univ College of Physicians and Surgeons, New York City*

When crystalline egg albumin (Ea) is partially deaminated at pH 4.0 and 0° C 2 fractions are formed. Fraction A, insoluble, and Fraction B, soluble, at the isoelectric point. In both the oxidized (–S–S–) and reduced (–SH) states fraction B has physical, chemical and immunological properties similar to those of Ea. Homologous and cross reactions of Ea and Fraction B with calibrated anti-Ea and calibrated anti-B sera were indistinguishable up to the region of moderate antigen

excess Differences, possibly significant, were noted only in the inhibition zone Fraction A, although 'denatured' was serologically different from both Ea and acid denatured Ea (DnEa) (*JACS* 67 574, 1945) Acid DnEa was partially deaminated at 0° C with HNO_2 at pH 3-3.5 The resultant DnEa Deam (-S-S- form) was reduced to the -SH form with thioglycolic acid at pH 7.5 Although there were small differences in physical and chemical properties, there were no significant immunochemical differences in a calibrated anti-acid DnEa serum The action of free HNO_2 on crystalline Ea gave a product similar to Fraction A In the Ea-anti-Ea and acid DnEa-anti-acid DnEa systems serological specificity appears to be unaffected by partial removal of amino groups and is uninfluenced by the state of the -S- groups as -S-S- or -SH (cf also *JBC* 110 343, 1935)

Reciprocal neutralization tests with four strains of poliomyelitis virus HOWARD A. HOWE *Poliomyelitis Research Center, Dept of Epidemiology, Johns Hopkins Univ, Baltimore, Md*

Reciprocal neutralization tests have been done in rhesus monkeys with 4 strains of poliomyelitis virus which were previously typed by the method of reinfection (Bodian *Am J Hyg* 49 200, 1949) and of immunization by vaccination (Morgan *ibid* 225) The Lansing, Brunhilde, Kotter and Frederick strains were tested with ten fold serial virus dilutions in the presence of distilled water, normal monkey serum and specific hyperimmune sera The numbers of animals receiving any given dilution ranged from 3-34 but averaged 9 The Lansing strain was also set up against 60 PD₅₀ of virus and half log dilutions of immune serum in groups of 3 monkeys and against 10 PD₅₀ of virus with ten fold serum dilutions in groups of 8 mice The homologous neutralization index of Lansing virus in monkeys was 4.5 by the method of virus dilution and 3.8 by serum dilution It was 4.0 by the serum dilution in mice All other homologous neutralization indices lay around 3 Sharp separation of the Lansing type from the other strains was demonstrated As in the studies cited above, the Brunhilde, Kotter and Frederick were found to be of the same type despite marked differences in clinical behavior in experimental animals

Universal serologic reaction in the differentiation of syphilis and yaws REUBEN L. KAHN *Univ of Michigan Hospital, Ann Arbor*

The reactions in syphilis and yaws given by the universal precipitation technique with lipid antigen are not identical in their serologic patterns This technique consists of quantitative precipitation set-ups with NaCl solutions of reduced (0 to 0.3%) and increased (1.5 to 2.1%) concentrations

compared with physiologic salt solution and also of moderate (0.6 to 1.2%) concentrations close to the physiologic level The precipitation results in all the set-ups are read on mixing the reagents and after 4 and 24 hours at ice box temperature It was found that precipitation given by the quantitative set-ups with reduced and increased salt concentrations is increased to a greater extent on cold incubation in syphilis than in yaws Precipitation given by the quantitative set-ups with moderate salt concentration is generally not increased by cold incubation in syphilis and may be increased by cold incubation in yaws, especially when untreated (Kahn, R. L. *Am J Clin Path* 19 347, 1949)

Structural changes produced in Brown-Pearce carcinoma cells by means of a specific antibody BERNARD KALFAIAN* AND JOHN G. KIDD *Dept of Pathology, The New York Hospital, Cornell Med Center, New York City*

Brown-Pearce carcinoma cells lose their viability when incubated with the antibody that reacts specifically with a distinctive constituent of them (*J Exper Med* 83 227-250, 1946) Furthermore, contrary to previous observations, they regularly manifest characteristic structural changes, evident both in fresh and in fixed preparations When the carcinoma cells are suspended as individuals in isotonic saline solution and incubated at 37°C with rabbit serum containing the specific antibody and complement, their cytoplasm immediately begins to swell and the cells become spherical The cytoplasmic basophilism rapidly diminishes and within 10-15 minutes but little remains Soon thereafter the cytoplasm in the fixed and stained preparations appears empty except for a moderate amount of amorphous acidophilic material together with a few rod-like, granular and vesicular bodies, in fresh cells the formed materials appear to be suspended irregularly in a transparent fluid that distends the cytoplasm Meanwhile, the plasma membrane is converted into an irregularly thickened acidophilic structure with swollen cytoplasmic particles adherent to it, 'blisters' do not develop from its outer surface as they regularly do within a few minutes from that of the viable cells suspended in saline or in rabbit serum devoid of antibody The nuclei often remain intact for some time after the cytoplasmic changes have become advanced, but within 30-60 minutes they and their nucleoli begin to shrink and the nuclear membrane becomes wrinkled, though the chromatin often remains unchanged in appearance for several hours before the nuclei finally become pyknotic These alterations do not develop spontaneously while the cells remain for long periods in saline solution or in normal rabbit serum

Effects of 'sensitized' lymphocytes on transplanted cancer cells JOHN G KIDD AND HELENE WALLACE TOOLAN * *Dept of Pathology, New York Hospital, Cornell Med Center, New York City*

Transplanted cancer cells proliferate for a time when implanted in racially-resistant mice but then regress, as is well known, histological observations indicate that the tumor cells are overcome by 'sensitized' lymphocytes—lymphocytes, that is to say, of hosts that have reacted against the alien elements, (*Federation Proc* 8 360, 373, 1949) In further experiments lymph nodes have been procured from A mice that had previously overcome the cells of the lymphosarcoma 6C3HED and hence were immune to them The nodes were minced and incubated at 37°C for 1-2 hours *in vitro* with suspensions of the lymphosarcoma cells This treatment regularly inhibited or abolished the ability of the lymphosarcoma cells to proliferate when the incubated mixtures were subsequently implanted into susceptible hosts Under identical conditions the serum of the same immune hosts had no effect on the lymphosarcoma cells and this was also true of minced lymph nodes procured from normal A mice By contrast, the host elements (predominantly lymphocytes) that had accumulated about sites where the lymphosarcoma cells had recently been implanted in the immune A mice proved notably active against the tumor cells in similar tests

Plate complement-fixation test and its application to the Cocksackie viruses LISBETH M KRAFT* AND JOSEPH L MELNICK *Section of Preventive Medicine, Yale Univ School of Medicine, New Haven, Conn*

Complement fixation tests may be performed on lucite plates using microdrops delivered by calibrated dropping pipettes, as recommended by Fulton and Dumbell Since the final total volume of the test is 0.1 ml, precautions must be taken against evaporation during the periods of fixation and hemolysis Ten lucite plates may be used in a single test, this is equivalent to 1000 tubes of a conventional test The technique has been applied to the identification of 7 strains of the Cocksackie virus group Serum and complement were varied on a single plate against a standard dose of antigen For antigen standardization a single dilution of hyperimmune serum was used while varying antigen and complement Results were obtained in terms of the amount of complement fixed A standard amount of each of the 7 strain antigens was tested with all 7 hyperimmune sera prepared against them The amounts of complement fixed at each serum dilution were then plotted graphically and the areas under the curves determined for each antigen From a comparison

of these areas, it was found that two strains were closely similar (Texas and High Point), one was partially related to another (Connecticut and High Point) and the remaining four (Ohio, Dillard types 1, 2 and 3) were distinct from each other and from the Connecticut, High Point and Texas strains

Immunological studies on Vi antigen from V form species of *Salmonella* MAURICE LANDY* AND H C BATSON *Dept of Biologic Products, Army Med Dept Research and Graduate School, Washington, D C*

Vi antigen originally was discovered in *Salmonella typhosa* and as a consequence, much of our knowledge of the immunological activity of this antigen has been established through the study of typhoid cultures However, protective potency data thus obtained are difficult to evaluate since Vi antigen preparation from such cultures generally contain the typhoid somatic factors IX and XII, which are known to possess immunogenic potency The discovery of Vi antigen in *Salmonella* species other than *S typhosa*, viz, *S ballerup*, *S coli* and *S paratyphi C* provided a means for the study of the immunological properties of Vi antigen in the absence of somatic factors common to *S typhosa* Vi antigen extracts were prepared by extracting acetone dried mass cultures of these V form organisms with 1% HCl The Vi antigen content of these extracts was estimated by both *in vitro* (precipitin and colodion particle agglutination tests with heterologous Vi antisera) and *in vivo* (mouse protection against *S typhosa* challenge) tests Employing these techniques it was found that V form cultures of *S ballerup* and *S coli* were the richest sources of Vi antigen, the Vi content of representative *S typhosa* cultures was somewhat less and that of *S paratyphi C* (East Africa) was least Active immunity tests yielded impressive evidence that these Vi antigen preparations were highly effective in protecting mice against challenge with V form typhoid cultures but were only slightly effective against W form typhoid cultures In quantitative assays the determined ED₅₀ values of the Vi extracts were found to be relatively independent of the virulence of the challenge strain employed Extracts of the V form cultures stimulated the production of Vi antibody in both rabbits and mice These results are indicative of the immunogenic identity of Vi antigen from the four known V form *Salmonella* species and of its marked effectiveness as an immunizing agent in experimental typhoid infection in mice

Stability of egg white inhibitor of influenza virus hemagglutination in relation to preparation of local standard of inhibitory activity FRANK LANNI, YVONNE THÉRI LANNI* AND J W

BEARD *Dept of Surgery, Duke Univ School of Medicine, Durham, N C*

To facilitate comparison of the activities of inhibitor preparations, measured on different days, efforts were made to establish a standard. Frozen samples of 10% egg white in buffered saline of pH 7.3, lyophilized samples, and samples stored with various preservatives in the cold were assayed periodically with heated swine influenza virus. The frozen and the lyophilized samples gave irregular results. Of the others, the most satisfactory were those preserved with 0.02% merthiolate or 0.25% phenol. With these, no significant change in activity could be demonstrated over a period of 6 months, except, possibly a slight drop in the first weeks. This initial drop may have been related to a slight precipitate which developed and settled in the early period. Except for this precipitate and a few small mold colonies appearing in some merthiolate-preserved samples, the physical character of the solutions was excellent. A sensitive criterion of degradation of the inhibitor is a change in the slope of the inhibition curve. For untreated inhibitor the slope is characteristically steep, but when inhibitor is treated with active influenza viruses, proteolytic enzymes, or certain protein-denaturing agents, or is exposed to elevated temperatures for long periods, weak inhibitor, characterized by a shallow slope, appears. Comparison of aged (6 months at about 5°) and fresh samples of egg white failed to show significant degradation in the former. It is concluded that an aged solution of egg white, preserved with merthiolate or phenol, is satisfactory for use as a local standard of activity.

Influence of ultraviolet irradiation on antibodies of pollen-allergic man MARY H. LOVELESS
Cornell Univ Med College, New York City

A student who had been used repeatedly over a period of a year for purposes of passive sensitization (Prausnitz-Kustner tests) developed jaundice which was diagnosed as being either homologous serum jaundice or infectious hepatitis. Because of the implication, it was deemed necessary to devise a method which would destroy the virus of homologous serum jaundice without injuring the sensitizing antibodies of the allergic patient. Accordingly, a large batch of serum containing the sensitizing antibodies for ragweed pollen was subjected to ultraviolet irradiation in a manner known to destroy the virus of homologous serum jaundice. Titrations were then carried out by the serum-dilution method as well as the antibody-neutralization procedure, in order to see whether irradiation had altered the activity of the serum. No differences between the original and the irradiated sample were perceived. It is advocated that all serum to be employed for passive sensitiza-

tion studies in the future be subjected to this type of ultraviolet irradiation.

Response to BCG as an index of genetic resistance to tuberculosis MAX B. LURIE AND PETER ZAPPASODI * *Henry Phipps Inst, Univ of Pennsylvania, Philadelphia*

Five highly inbred rabbit families of different known genetic resistance to tuberculosis were given a single intracutaneous inoculation of 1 to 3 million of finely dispersed viable BCG. The growth of the lesion at the site of inoculation and its healing, as well as rate and intensity of development of tuberculin sensitivity were measured and correlated with the varying genetic resistance of these rabbits to virulent bovine tubercle bacilli. It was found that in resistant rabbits the lesion at the site of inoculation grows rapidly, reaches its peak quickly and heals promptly. In susceptible rabbits this lesion grows more slowly, achieves its height less quickly and heals much more tardily. Associated with these differences there is a more rapid and, usually, more intense development of tuberculin skin sensitivity in the natively resistant animals. Since even fully virulent human type tubercle bacilli are more rapidly destroyed in the tissues of natively resistant than in those of naturally susceptible animals, it may be inferred that the more rapid development of allergic sensitivity by the more resistant animals is due to the more rapid disintegration of the BCG in the tissues of these animals, and hence, to a more rapid release of the sensitizing antigens in their tissues. Since BCG causes a typical but evanescent tuberculosis, the procedure offers a simple and adequate test for selecting breeding rabbits of the desired genetic resistance and susceptibility to the infection. Furthermore, since the resistance acquired from this vaccination by the parents is not transmitted to the offspring, there is no inherent objection to using the latter in studies on the nature of the genetic resistance to this disease. Finally, the relative, graded resistance of the vaccinated rabbits of the different families is not altered by this BCG inoculation, for on reinfection with virulent bovine tubercle bacilli the rabbits retain their original, varying resistance.

Complement-fixation tests as an aid in the differential diagnosis of extra-intestinal amebiasis SARA C. McDEARMAN AND WOLCOTT B. DUNHAM (introduced by DOUGLAS H. SPRUNT)
Veterans Admin Med Teaching Group, Kennedy Hospital, Memphis, Tenn

Intestinal infections with *Endameba histolytica* usually can be diagnosed by the demonstration of amebae in the stools, but the frequent inability to find amebae in other organs has presented difficulties in the diagnosis of extra-intestinal

involvement The present study indicates that complement-fixation tests are of especial value in drawing attention to the possible presence of amebic infections other than intestinal The technique employed was the quantitative complement-fixation test of Kent and Rein using a commercial antigen prepared according to a modification of the method of Rees and associates The patients on whom tests were performed were classified as follows extra-intestinal amebiasis, 20 positive, 3 negative, intestinal amebiasis, only, 27 positive, 183 negative, equivocal or no evidence for amebiasis, 22 positive, 2337 negative Though some cases of intestinal infections without apparent extension to other viscera gave positive reactions, the fact that $\frac{1}{8}$ of all cases with positive tests had extra-intestinal infections indicates that the chief value of the test is in the differential diagnosis of this form of infection This interpretation is strengthened by the finding that 20 out of 23 cases of extra-intestinal infections gave positive tests

Persistence of antigen PHILIP D McMASTER AND HEINZ KRUSE (introduced by JULES FREUND)
Rockefeller Institute for Medical Research, New York City

A 'tagged' antigen (a blue azoglobulin), intravenously injected into mice, can be identified later in reticulo-endothelial cells throughout the body The subsequent retention of some sort of blue dye-protein in these cells for several months has raised the question, how long does the injected antigen persist as such? To test the point, immunological observations recently obtained in this laboratory have been used Characteristic constrictions of the smaller blood vessels, seen under the microscope in the ears of passively sensitized mice when injected with antibody, serve as an exceedingly delicate test for anaphylactic sensitivity, so delicate that the absorption of only 0.5% of bovine γ -globulin, from the peritoneum of a mouse can be detected, 1-2 days later, by an intravenous injection of anti-globulin serum The persistence of bovine γ -globulin (as antigen) in mice, injected intravenously with 0.1 cc of a 5% solution of it, was sought, 1-70 days later, by injecting ground liver and blood from these animals into the peritoneal cavities of normal mice Two days later, the recipients, given intravenous injections of anti-globulin serum, showed the specific vascular reactions, just mentioned, indicating the absorption of transferred antigen Suitable controls yielded negative results Apparently some of the antigen, as here employed, can persist in mice for at least 70 days

Sorption of influenza virus by chicken erythrocytes THOMAS P MAGILL *Dept of Microbiol-*

ogy and Immunology, Long Island College of Medicine, Brooklyn

The mechanism involved in the sorption and elution of influenza virus by erythrocytes is of importance because it may help clarify the physiology of virus infections It has been generally assumed that in infectious processes the virus is the aggressor, but no satisfactory explanation for the aggressiveness had been offered until Hirst suggested on the basis of his own observations that the influenza virus possesses an enzyme activity with an affinity for certain receptors on the cell surface He hypothesized that the virus attaches itself to specific receptors and is subsequently eluted because of the destruction of the receptors by the enzyme activity That the hemagglutinating activity of influenza virus is not entirely a specific phenomenon is clear from data previously presented Suspensions of some strains of influenza virus which do not agglutinate sheep erythrocytes under usual test conditions, readily agglutinate those erythrocytes when the test systems are adjusted with suitable buffer mixtures Moreover, addition of suitable buffers will eliminate certain obvious differences between hemagglutination which resembles the 'O' kind and of the 'D' kind That is, hemagglutination by allantoic fluid containing influenza virus is in part, at least, influenced by conditions effected by buffer mixtures (pH?) Hirst and others have reported that chicken erythrocytes will sorb most of the influenza virus from infected allantoic fluid But, little attention has been given to the small amount of virus remaining in the allantoic fluid after sorption

Further studies on kinetics of immune hemolysis

MANFRED M MAYER, CHARLES C CROFT* AND WALTER M BOWMAN* *Dept of Bacteriology, Johns Hopkins School of Hygiene and Public Health, Baltimore, Md*

Various factors influencing the kinetics of the lysis of erythrocytes by antibody and complement have been studied Emphasis has been placed on the dissociation of antibody from sensitized erythrocytes or red cell stromata This dissociation, which has been found to vary in extent with different hemolytic antisera, can lead to continuous transfer of antibody from cell to cell, producing a marked effect on the kinetics of hemolysis

Social serology antibody levels in a normal young population during an epidemic of poliomyelitis JOSEPH L MELNICK AND NADA LEDINKO* *Section of Preventive Medicine, Yale Univ School of Medicine, New Haven, Conn*

An attempt has been made to relate socioeconomic conditions to the development of certain antibodies in a normal urban population

and to follow the level of these antibodies during the course of an epidemic of poliomyelitis. The antibodies studied included 1) neutralizing antibodies to the Lansing strain of poliomyelitis virus, 2) neutralizing (and complement fixing) antibodies to a local strain of Coxsackie virus isolated during the epidemic, 3) antihemagglutinins to Newcastle disease virus, 4) antihemagglutinins to Type A influenza virus, 5) agglutinins to Group A Type 4 hemolytic streptococcus and 6) total 'gamma globulin' determinations. During the 1948 epidemic of poliomyelitis in North Carolina, 250 samples of serum of normal children in Winston-Salem were obtained at the beginning of the epidemic and again at the end in the late fall. Specimens were obtained from both negro and white children from 6 months to 15 years of age living under favorable and unfavorable economic circumstances. As a baseline for the newborn, 19 placental bloods were collected in the same area. Marked differences in levels of gamma globulin, Lansing poliomyelitis antibodies, and streptococcal antibodies were present in the groups living under different social and sanitary conditions in the same city. Children in the more favored group developed antibodies at a significantly older age than those in the less favored group. The only antibodies which increased during the epidemic period were the Lansing poliomyelitis and Coxsackie virus antibodies.

Lymphocyte origin of a plasma factor responsible for *in vitro* tuberculin type hypersensitivity

JOSEPH M. MILLER AND CUTTING B. FAVOUR (introduced by J. MUELLER) *Med Clinics, Peter Bent Brigham Hospital and Dept. of Medicine, Harvard Med. School, Cambridge, Mass.*

One feature of the *in vitro* tuberculin effect is the affinity of leukocytes from tuberculin negative as well as tuberculin sensitive hosts for tuberculin. When white cells are sensitized with tuberculin and exposed to a factor in the serum from tuberculin sensitive subjects, they undergo lysis. This lytic plasma factor is present in the euglobulin portion of blood, is heat labile and requires complement for its specific effect. The present aim was to demonstrate that the plasma factor could be derived from the lymphocytes of the circulating blood of an appropriately sensitized host. As tuberculin sensitized subjects, humans hospitalized with active tuberculous infection and guinea pigs sensitized with heat killed tubercle bacilli were chosen. Normal tuberculin-negative humans and uninoculated guinea pigs served as controls. White cells were obtained from the blood of these subjects by a method using Fraction I of Cohn and the white cells were further separated into suspensions rich in lymphocytes alone and neutrophils alone. These cells

were washed free of parent plasma and resuspended in the plasma of unsensitized subjects. By prolonged incubation of these cell-plasma suspensions it was possible to 'activate' plasma from an unsensitized host so that it became rich in the cytolytic factor previously found only in plasma of strongly sensitized subjects. By further dialysis procedures, it became apparent that the factor in such 'activated' plasma is the same in many chemical properties as fresh plasma factor. Differential studies of lymphocytes and neutrophils suggest that the origin of this plasma factor is the lymphocyte of the tuberculin sensitive host.

Complement-fixing brain antibody in experimental disseminated encephalomyelitis in mice P. K. OLITSKY, J. CASALS* AND L. C. MURPHY* *Rockefeller Inst. for Med. Research, New York City*

Murine encephalomyelitis (DE) was produced by intramuscular injections of homologous brain and adjuvant (*J. Exper. Med.* 90:213, 1949) to study development of complement-fixing (CF) antibody against brain tissue in response to the injections, and in relation to visible signs of DE. An experiment was performed with pooled blood sera from 23 mice in 3 series of 6-10 in each, also with that of 19 mice in 3 series of 6-7 each which received 3 injections of brain plus adjuvant and were bled 20 days after the first inoculation, before DE signs were manifested. Included were pooled 13 sera from 7 mice collected during the height of DE; they received 3-6 injections. Also pooled sera from 3 mice obtained during quiescent stage between relapses and bled 3-6 days after recovery from the last one, also, sera from 7 mice bled after 83 days and 6 times injected, which had not shown signs of illness. A marked CF reaction resulted with sera derived from animals having DE signs, or in quiescent stage, all others were negative even in 1:2 or 1:4 dilutions. Moreover, positive reactions were obtained only with saline extracts of normal mouse, beef, sheep, guinea pig and rabbit brain used as CF antigens, acetone-ether extracted ('dehpinized'), infant mouse (myelin-poor) brain, and mouse liver, testis, kidney, muscle and lung CF antigens gave completely negative results. Further studies may reveal any correlation between such antibody and DE, also the particular component in brain that induces the affection.

Diagnostic tests with Albany, type I and II Coxsackie (Dalldorf) virus P. K. OLITSKY, J. CASALS* AND L. C. MURPHY* *Rockefeller Inst. for Med. Research, New York City*

Antigenic differences among Coxsackie viruses have been demonstrated by means of the neutralization test. An investigation was undertaken

of the possible application of the complement-fixation (CF) test as a diagnostic method in man as well as a means for detecting immunological differences among these viruses CF antigens prepared from infected mouse-limb tissue were found satisfactory especially when treated with acetone-ether, no antigen was found in brain tissue Immune sera were obtained from mice bled after 2-4 injections of infected limb tissue, brain tissue, on the other hand, yielded no complement-fixing antibody With these materials, Albany (Dalldorf) virus types I and II were found unrelated, the specific titers of the sera were between 1:16 and 1:128, and that of the antigens between 1:4 and 1:16 No cross-reactions occurred, even when sera were used in dilution of 1:2 and when undiluted antigens were added Tests with additional strains, obtained from other laboratories, are in progress Human sera thus far collected from patients in widely different areas have reacted with one of the Albany types (type I) but not with the other Hemagglutination tests, using either infected mouse limb or brain tissue as source of virus, and sheep, chick, guinea pig, and human O erythrocytes, have yielded no positive results under varied conditions of incubation time and temperature, and with different media for suspending the virus

Amino acid inhibition of Theiler's GD VII virus in mouse brain mince HAROLD E PEARSON AND RICHARD J WINZLER * *Depts of Microbiology and Biochemistry, Univ of Southern California School of Medicine and Laboratory Division, Los Angeles County Hospital, Los Angeles, Calif*

As reported previously (*Federation Proc* 8:409, 1949), L-lysine monohydrochloride was the only naturally occurring amino acid in concentration of 1 mg/ml found to inhibit the propagation of Theiler's GD VII strain of mouse encephalomyelitis virus in cultures of minced one-day mouse brain contained in flasks of Simm's solution and incubated at 35° C for 2 days L- α -aminoadipic acid and α -ketoadipic acid but not α -ketoglutaric acid also inhibit virus In concentrations of 3 mg/ml the following amino acids, tested individually, inhibit virus production L-arginine monohydrochloride, L-cysteine hydrochloride, L-cystine, L-histidine monohydrochloride, DL-ornithine, DL-serine, DL-threonine and L-tryptophane In concentrations of 3 mg/ml the following do not inhibit virus DL-alanine, L-glutamic acid, glycine, L-leucine, DL-methionine, L-proline or DL-valine Attempts were made to reverse the inhibiting action of L-lysine monohydrochloride (1 mg/ml) by addition of the various, individual amino acids DL-methionine, L-leucine (3 mg/ml) and L-tyrosine (1 mg/ml)

partially prevent the inhibition Methionine does not reverse inhibition by histidine or by tryptophane Virus inhibition by lysine and the protective action of methionine on virus propagation are paralleled by the effects of this amino acid on the $P^{32}O_4$ uptake by minced, one-day old mouse brain

Relation between propagation of a mouse encephalomyelitis virus and uptake of radiophosphate by minced brain from mice of different ages HAROLD E PEARSON, RICHARD J WINZLER,* AND MAX E RAFELSON * *Depts of Biochemistry and Microbiology, Univ of Southern California School of Medicine and Laboratory Division, Los Angeles County Hospital, Los Angeles, Calif*

It has previously been shown that minced one-day old mouse brain was capable of supporting the propagation of Theiler's GD VII mouse encephalomyelitis virus *in vitro* Virus-infected cultures incorporate inorganic phosphate into their phospholipids and nucleoproteins at rates significantly greater than uninfected controls Minced brain from mice older than 10 days is unable to support virus growth A study of the rates of oxygen consumption and of P^{32} uptake by minced brain tissue from mice of different ages in the presence and absence of virus shows that older mouse brain has a higher initial Q_{O_2} than one-day old mouse brain, but that the Q_{O_2} declines at a very much more rapid rate than one-day old tissue The incorporation of inorganic phosphate into the lipids and proteins in a 24-hour incubation period is much greater in the one-day old brain than in older brain The stimulating effect of the virus on these processes is no longer apparent in brain from mice older than 7 days, and corresponds to the ability of the tissue to support virus growth

Specific protection of the antibody-combining site during iodination of antibody DAVID PRESSMAN AND L A STERNBERGER * *Sloan-Kettering Inst for Cancer Research, New York City*

Although it is known that antibody specificity can be destroyed by extensive iodination, we have found that it is possible to protect the antibody specific region so that iodination, extensive enough to cause otherwise complete destruction of specificity, can be carried out with essentially complete retention of antibody specificity The specific protection was made in the case of antibody specific to the p-azobenzoate ion or the p-azobenzenearsonate ion by adding to the antiserum, before iodination, the specific hapten, either benzoate ion or benzenearsonate ion Subsequent iodination intense enough to destroy the antibody activity of the unprotected serum did

not alter appreciably the antibody activity of the protected sera, since almost full antibody activity, as measured by specific precipitation, was recovered by dialyzing out the protecting hapten after iodination. The mechanism of protection is the steric blocking of an attack by the iodine on the antibody specific combining region since that region is already combined with the hapten.

Chemical and immunological studies on lecithin and cardiolipin **FREDERICK A H RICE*** AND **ABRAHAM G OSLER** *Johns Hopkins Univ and USPHS Research and Post Graduate Training Center, Baltimore, Md*

Beef heart lecithin prepared according to Pangborn for use with cardiolipin in serologic tests for syphilis has been fractionated into 3 components on a mixture of celite and magnesol. Only one of these components is active as a constituent of the lecithin-cardiolipin-cholesterol test antigen. Cardiolipin has also been partitioned chromatographically into 2 components, both of which are active in flocculation tests for syphilis. It has been found that of the 3 constituents of the test antigen, cardiolipin alone reacts with antibody present in syphilis sera, while lecithin and cholesterol perform auxiliary functions.

Inhibitory and enhancing effects of secretions of human respiratory tract on influenza virus **HARRY M ROSE** *Depts of Medicine and Bacteriology, College of Physicians and Surgeons, Columbia Univ, New York City*

Mucoid secretions of the human respiratory tract (sputum) contain factors other than specific antibodies which will either inhibit or enhance infection by the PR8 strain of influenza virus and which will also inhibit the agglutination of erythrocytes by the virus. One of these factors is spontaneously labile and is rapidly destroyed by heating to 100°C, it appears to be responsible for the ability of certain sputum specimens to inhibit viral hemagglutination in high dilution, to reduce infectivity of virus inoculated intranasally in mice and to restrict multiplication of the virus in chick embryos. A second factor is present which is relatively stable and resembles in many respects the Francis inhibitor (*J Exper Med* 85:1, 1947) found in normal serum. This factor inhibits viral hemagglutination but seems to have little or no effect on infectious properties of the virus. Heating to 100°C for 10-30 minutes does not destroy this factor and actually increases its inhibition titer against some strains of virus, particularly Lee. There is evidently a third factor which markedly enhances the infectivity of the PR8 strain when injected intraperitoneally in mice. A similar type of enhancement is obtained with hog gastric mucin but not with purified

blood group A substance, histamine, hyaluronic acid, hyaluronidase or pneumococcal polysaccharides. When preparations of sputum are progressively heated to 100°C their ability to reduce infectivity of the virus is lost and enhancement of infectivity is correspondingly increased. These results suggest that substances in the secretions of the human respiratory tract may play a significant role in determining either resistance or susceptibility to infection by influenza virus, possibly depending upon the equilibrium of these substances.

Streptococci and related filtrable infective agents in outdoor air during epidemics of influenza and of milder respiratory infections **EDWARD C ROSENOW** *Bacteriologic Research, Longview Hospital, Cincinnati, Ohio*

The study was made to determine perhaps the importance of aerial spread of pneumotropic streptococci and a possible related pneumotropic virus during epidemics of respiratory infections. Non-hemolytic streptococci were isolated from each of 17 samplings made on trains and automobiles in transit totalling 7000 miles and atop 12-foot poles and on tall buildings during and following epidemics. Mice were inoculated cerebrally and/or nasally and 11-day embryonated eggs into the allantois or yolk sac with saline washings or Seitz filtrates and with streptococci as isolated in dextrose-brain broth and with emulsions and filtrates of emulsions of pneumonic lungs and of allantoic fluid of inoculated eggs in which the embryo died on successive mouse and egg passage. The incidence of pneumonitis in mice and death of embryo and isolations of streptococci from emulsions of pneumonic lungs and of embryos that died were far greater following inoculation of material from samplings made during epidemics than from samplings made after epidemics had subsided. Isolations of the streptococcus from pneumonic lungs and allantoic fluid of inoculated embryonated eggs following inoculation of filtrates were far higher than isolations from the filtrates inoculated, indicating that the vital tissues for which the streptococcus had predilection furnished more favorable conditions for growth of filtrable forms into the streptococcus than dextrose-brain broth. The streptococci isolated from saline washings, from pneumonic lungs and inoculated eggs were agglutinated specifically by antisera and thermal antibody prepared from streptococci isolated from persons having respiratory infection and by convalescent serum.

Antibody in yolk of eggs and in serum from hens inoculated with viruses of influenza and poliomyelitis **JONAS E SALK AND J S YOUNGNER*** *Virus Research Lab, Dept of Bacteriology, Univ*

of Pittsburgh School of Medicine, Pittsburgh, Pa

It is known that antibody to certain antigens is present in egg-yolk of laying hens with high serum antibody titers. It seemed of interest to investigate this phenomenon further in regard to the mechanism whereby antibody appears in the yolk, and to explore the use of eggs of immunized hens as a possible source of antibody in large quantity. Groups of laying hens were inoculated into the breast muscle with either the PR8 strain of Type A influenza virus or the Lansing strain of poliomyelitis virus, with and without combination with an adjuvant (Bayol F and Arlcel A, described by FREUND). Blood samples were obtained at intervals and all eggs laid were tapped. Antibody determinations were made on serum samples and on aqueous extracts of yolk freed of the major portion of the lipid components by extraction with ether and ethylene dichloride. Only in animals given Lansing virus with adjuvant did antibody appear in serum and yolk. However, in hens inoculated with influenza virus with or without adjuvant, antibody in high titer developed, with adjuvants the levels reached were considerably higher. Antibody appeared in yolk later than in serum. Subsequently, in adjuvant vaccinated hens, titer of antibody/unit vol of yolk was equivalent to that in serum and was consistent in successively laid eggs. From time to time, however, in hens given virus alone, eggs were laid which had no demonstrable antibody despite moderate serum levels. The mechanism of the phenomenon, which does not appear to be one of passive transfer, is under investigation.

Active immunization of mice against experimental infection with type I meningococci H W SCHERP Dept of Bacteriology, Univ of Rochester School of Medicine and Dentistry, Rochester, N Y

Four materials were tested for their ability to immunize mice against experimental infection with type I meningococci: a vaccine of formalinized virulent type I meningococci, as a control, the soluble portion from cells of the same strain autolyzed with chloroform, as a source of soluble antigens, the insoluble portion of the autolyzate, as a source of antigens stable to autolysis, and purified specific polysaccharide from the same strain. Groups of mice received 3 or 4 injections of these materials intraperitoneally during a period of one or 2 weeks. One week after the last injection, the mice were challenged with the homologous meningococcus suspended in gastric mucin. Mice receiving 4 doses of 0.01 mg (= 20,000,000 cells) or more of the vaccine resisted from 100,000 to 200,000 LD₅₀. Mice receiving 4

doses of 0.001 mg resisted 5,000 LD₅₀. Three or 4 doses of from 0.001-0.1 mg of the soluble portion of the autolyzate induced essentially no immunity. Initially, 4 doses of 0.1 mg of the insoluble portion of the autolyzate were as effective as 4 doses of 0.001 mg of the vaccine, but this capacity decreased progressively in successive tests of the same preparation. Three or 4 doses of from 0.0001-0.01 mg of the polysaccharide engendered no demonstrable immunity. The test organism evidently possessed an adequate complement of immunizing antigen, which was largely decomposed during autolysis since neither the soluble portion nor the polysaccharide immunized, and the small fraction of immunizing antigen remaining in the insoluble portion decreased with time.

Immunization experiments with *Ascaris lumbricoides* in rodents J F A SPRENT Ontario Research Fdn, Toronto, Canada

Attempts to immunize mice to infection with the larvae of *Ascaris lumbricoides* by injection of metabolic products of adult and larval worms and with homologous antiserums were not successful. The relationship between the antibodies produced by ascaris infected guinea pigs and substances present in the tissues and fluids of the worm was studied using anaphylaxis as an indication of antigen-antibody reaction. All isolated tissues and fluids of *A. lumbricoides* and whole worm extracts of certain other nematodes caused anaphylaxis in ascaris infected animals. *Ascaris* extracts from which protein had been removed by trichloroacetic acid and ammonium sulphate were active in this way and precipitation of polysaccharides by alcohol failed to alter the effect. Guinea pigs infected with *Trichinella spiralis* were also shocked by ascaris extracts. The presence of a common antigen among helminths, functional in promoting resistance, was suggested by the observation that previous infection with nematodes other than *A. lumbricoides* resulted in increased resistance to *A. lumbricoides*.

Specific purification of antiprotein antibody L A STERNBERGER* AND DAVID PRESSMAN Sloan-Kettering Inst for Cancer Research, New York City

A procedure has been developed which is probably of general applicability for the specific purification of antiprotein antibody. The principle involved is the alteration of the specific antigen so that it can be separated from the antibody brought down in the specific precipitate. The alteration was accomplished by coupling the specific antigen with diazotized arsanilic acid. It was shown that such an antigen can be removed from an alkaline solution by a suspension of calcium aluminate while rabbit γ -globulin remains

in solution under these conditions. The coupled antigen retained the ability to precipitate specifically the antiprotein antibody. The purified antibody was obtained from the specific precipitate with the coupled antigen by dissolving the washed precipitate in calcium hydroxide solution and removing most of the antigen on a suspension of calcium aluminate, leaving purified antibody in solution. By this method solutions of antibody to bovine serum albumin and to bovine serum globulin have been obtained with essentially all of the protein precipitable as specific antibody. The yields were above 30%.

Properties of partially purified scarlet fever (erythrogenic) toxin prepared by various methods AARON H. STOCK AND ETHEL VERNEY *
Dept. of Pathology and Bacteriology, Children's Hospital of Pittsburgh, Univ. of Pittsburgh School of Medicine, Pittsburgh, Pa.

The NY5 strain of hemolytic streptococcus was grown in the dialyzable portion of (Difco) proteose peptone by methods of mass culture. From the filtrates, purified scarlet fever toxin was prepared by 4 different methods: 1) precipitation of concentrated filtrate with alcohol, 2) adsorption on aluminum silicate followed by elution and salting out, 3) salting out with ammonium sulfate, and 4) prolonged dialysis of concentrated filtrate. The 4 types of concentrated toxin had these properties in common: a) all flocculated at the same level with most commercial antitoxins, b) all contained small amounts of acid-precipitable protein, and varying amounts of non acid-precipitable protein with which scarlet fever toxin has been associated in previous studies, and also other nitrogenous material, c) when the acid-precipitable protein was separated at the isoelectric point, varying amounts of the flocculating (and presumably erythrogenic) substance were concomitantly removed, d) all contained nucleases. The purified toxins differed as follows: a) streptococcal hyaluronic acid in large quantities was found only in concentrates produced by methods 1 and 4, b) the proteins in concentrates by methods 2 and 3 varied in heat coagulability. Only 1 lot of the many prepared concentrated toxins contained a high titer of skin test doses (STD)/mg of total nitrogen or protein similar to those described by Stock, and Krejci, Stock, *et al.* (1942). Inasmuch as more streptococcal protein/STD was found in the present purified toxins than previously reported by one of us, attempts were made to explain this difference by resolving the mixture via fractionation, electrophoresis or ultracentrifugation. These experiments met with limited success. The significance of the difference in data from those previously reported will be discussed.

Toxic Component of *Shigella paradysenteriae*

CHLOE TAL* AND WALTHER F. GOEBEL, *Rockefeller Inst. for Med. Research, New York City*

The component responsible for the toxicity of the somatic antigens of *Shigella paradysenteriae* is resistant to a variety of enzymes. It should be possible, therefore, to degrade these substances by enzymatic procedures without impairing the toxic component itself. The somatic antigen of Type Z *Shigella paradysenteriae* is a lipocarbohydrate-protein complex as are those of the other Flexner types. Digestion of the Type Z antigen with pancreatin reduces the nitrogen content from 6.5-2.7%. Subsequent treatment with acid formamide, and precipitation with alcohol, yields a product still as toxic as the original material and containing 2.1% nitrogen and 1.2% phosphorus. This substance is antigenic and still shows an absorption band at 2550 Å, as did the untreated antigenic complex. Digestion of the former with intestinal alkaline phosphatase brings about a further loss of 10% of the total phosphorus and a loss of the absorption band, but there is no diminution in toxicity. Color tests for amino acids are now negative. This material contains 22.3% glucosamine which agrees with the total nitrogen content, 2.1% of it is still fully toxic and antigenic. Extraction with chloroform-methyl alcohol removes all remaining lipid (5%) and 10% of the remaining phosphorus without diminishing toxicity. It appears, therefore, that both the protein and the lipid components can be dissociated from the complex without impairing the toxic component. The latter still unidentified remains in chemical combination with a non-toxic carbohydrate from which it has not yet been separated.

Role of spleen in hemolysin production WILLIAM H. TALIAFERRO AND LUCY G. TALIAFERRO *
Dept. of Bacteriology and Parasitology, Univ. of Chicago, Chicago, Ill.

Following a single intravenous injection of 2.5×10^9 sheep erythrocytes/kg into rabbits, serum hemolysins (determined photometrically) generally rose sharply around the 4th day, reached a peak from the 7th through the 10th day and then declined. The titers of serums from such immunized rabbits and of splenic extracts, prepared by mincing spleens in a Waring blender with distilled water, showed 3 stages: 1) For the first 4 days, splenic and serum titers were low and approximately the same. 2) From the 5th to the 8th day, splenic titers rose more slowly than serum titers. 3) From the 11th to the 18th day, splenic titers decreased rapidly while serum titers declined more slowly. Splenectomy significantly depressed antibody formation when performed on the day of immunization through the 4th day,

was sometimes effective when performed on the 5th day, and was practically ineffective when performed on the 6th and 8th day. The results indicate that, under the conditions of these experiments, most of the antibody is formed by the spleen and that active formation is limited to a comparatively short period.

Studies on allergic encephalomyelitis in dogs

LEWIS THOMAS, F Y PATERSON AND ELIZABETH SMITHWICK (introduced by JULES FREUND) *Division of Infectious Disease, Dept of Medicine, Tulane Univ School of Medicine, New Orleans, La*

Allergic encephalomyelitis has been produced in dogs following immunization with homologous brain plus adjuvants. The disease occurs with less frequency than in monkeys or guinea pigs, and requires a greater number of injections over a longer period of time. Following immunization of dogs with homologous brain, a complement-fixing antibody is demonstrable in the majority of animals. The antigen involved is demonstrable in the brains of other species, is not present in new born brain tissue, and is present in peripheral nerve but absent in other organs. It is obtainable from brain extracts following boiling and formalinization. The antigen is soluble in acetone, alcohol, and ether. It is abundantly present in acetone extracts of purified white matter lipids. Its activity is not diminished by saponification. It is distinct from cholesterol and is not precipitated by digitonin. The activity of the antigen is such that complement fixation occurs with quantities of 1 γ or less/cc. Serum titers of immunized dogs range from 1:32 to 1:512. The possible nature of the antigen and its role in allergic encephalomyelitis will be discussed.

Antigenic extinction principle in potency-testing rabies vaccines

F W TRADER* AND I W MCLEAN, JR *Research Labs, Parke Davis & Co, Detroit, Mich*

The antigenic extinction principle consists of vaccinating groups of animals with serial dilutions of the preparation to be assayed and then determining, indirectly by serum assays for the presence or absence of an arbitrary level of antibody, the limiting dilution of the preparation containing sufficient antigen to give the required antibody response. This procedure has been used in testing influenza virus vaccines and the results reported here demonstrate its applicability to rabies vaccines. The tests are conducted in white Swiss mice, are relatively economical and give highly reproducible results. It was found that 1) Indirect serum neutralization gives a more reliable and sensitive test than direct challenge, but correlation between the 2 methods is good. 2) The total amount of 'brain tissue-virus'

administered was the most important variable, with number of injections, schedule of injections, volume or concentration administered in the vaccination, time of bleeding (after 10 days), number of virus MLD's utilized in the neutralization (10-1000), time allowed for neutralization (0.5-18 hours), and size of mice used in testing for neutralization (11-20 gm) producing only minor variations in the antigenic titer. The data accumulated have resulted in a reliable test method for antigenicity of rabies vaccines either by direct comparison with a reference standard vaccine or by setting an arbitrary minimum level for the antigenic extinction titer when tested under standardized conditions.

Quantitative studies of complement fixation

Complement-fixing potency of immune sera in relation to antibody nitrogen content. A G OSLER, A L WALLACE,* AND M M MAYER *Dept of Bacteriology, Johns Hopkins School of Hygiene and Public Health, Baltimore, Md*

Quantitative complement fixation studies with crystalline bovine serum albumin and homologous rabbit antisera indicate that the extent of fixation in terms of the number of 50% units of complement fixed is not a direct linear function of the amount of antibody, but follows a sigmoid curve. The use of a 50% fixation unit ($C'F_{50}$), based on absolute antibody weight or on serum dilution, is proposed as a means of characterizing the complement-fixing potency of an antiserum. The number of $C'F_{50}$ per μ gm of antibody N varies with the length and intensity of immunization but is not a function of the total antibody content.

Formation of neutralizing antibodies in monkeys after injection of poliomyelitis virus and adjuvants

ROBERT WARD, DORA RADER, MURRAY M LIPTON AND JULES FREUND *Dept of Pediatrics, New York Univ Med Center and Public Health Research Inst of The City of New York, Inc, New York City*

Rhesus monkeys received 5 simultaneous intramuscular injections of monkey spinal cord containing Lansing poliomyelitis virus suspended in physiological saline (A), or emulsified in paraffin oil (B), or emulsified in paraffin oil containing killed *Myco butyricum* (C). Five weeks later all animals received preparation A in the same manner. At each of the 2 occasions, the monkeys were given 1 gm of infected cord. Serum neutralizing antibodies were titrated in mice against about 20-50 LD₅₀ units of virus. The titers, 4 weeks after the first injection and 2 weeks after the second injection were several times higher in the groups receiving adjuvants (B and C) than in the group with virus alone (A). Some of the monkeys in group C with *Myco butyricum* died of

allergic encephalomyelitis In another experiment in which monkeys were vaccinated with virus incorporated in paraffin oil and given a booster injection of virus alone, similar results were obtained Morgan and her associates (*J Exper Med* 85 131, 1947, *Am J Hyg* 45 379, 1947, *J Immunol* 62 301, 1949) found that repeated i.m injections of Lansing virus in monkeys resulted in high neutralizing antibody titers When Morgan injected subcutaneously 2 or 3 times a small amount of virus emulsified in paraffin oil with or without killed *Myco tuberculosis*, antibody formation was scant

Applications of protamine precipitation in purification of certain viruses J WARREN, M L WEIL,* S B RUSS* AND M JEFFRIES * *Dept of Virus and Rickettsial Diseases, Army Med Dept Research and Graduate School, Washington, D C*

The addition of protamine sulfate to virus infected tissue suspensions will cause an immediate flocculation of considerable tissue material and if the mixture is centrifuged at low speeds a clear supernate is separated from a tenacious sediment We have studied the behavior of a number of mammalian viruses in this reaction and they appear to fall into 2 groups, those which remain in the supernatant and those which are precipitated in the sediment along with tissue components Viruses in the protamine supernatant can be further purified by the removal of the excess protamine with heparin or Paritol In the case of Japanese encephalitis and encephalomyocarditis viruses, we have followed protamine clarification with other procedures as ether extraction, enzymic digestion, ammonium sulfate precipitation or ultracentrifugation As the result of such treatment it is possible to obtain virus concentrates which on the basis of nitrogen content, infectivity and electron micrography appear to be of high purity For example, preparations of encephalomyocarditis virus have been obtained with $10^{15.9}$ LD₅₀/gm of nitrogen In the case of those agents which are precipitated by protamine along with other tissue proteins, it has been found that resuspension of the sediments in high concentrations of sodium chloride will free the virus from the bulk of the precipitate It may then be subjected to any of the above procedures

Inhibition of LA-peptidase by tuberculo-carbohydrates and its possible significance in the mechanism of the cytotoxic action of tuberculin CHARLES WEISS, MARIAL L BOYAR* AND CHARLOTTE H SCHARF * *Laboratories, Jewish Hospital, Philadelphia, Pa*

In order to throw light on the mechanism of the cytotoxic action of tuberculin, the properties of its components (proteins, lipids and carbohy-

drates) have been investigated Weiss and Halliday (*Proc Soc Exper Biol & Med* 47 299, 1944) showed that a polysaccharide prepared by S Raffel by the method of Heidelberger and Menzel from human tubercle bacilli inhibits BA-amidase (Cathepsin II) We now wish to record that a carbohydrate prepared by R J Anderson from human tubercle bacilli as well as a purified tuberculo carbohydrate, freed from lipids (N Choucrour, *C R Acad Sci* 226 1477, 1948) inhibits leucine amino-peptidase from both normal and tuberculous rabbit organ homogenates Other polysaccharides, such as one extracted from *S marcescens* by M J Shear and non-bacterial carbohydrates such as dextrose, sucrose and glycogen are inert in this respect LA-peptidase has its origin in the lymphocytes and is widely distributed in the body (J Fruton) This enzyme functions in the processes of cellular growth and autolysis Since its activity is inhibited by tuberculo-polysaccharides, we have a possible factor in the mechanism of the cytotoxic action of tuberculin

Newcastle disease virus encephalitis in rhesus monkeys H A WENNER, A MONLEY, AND R N TODD (introduced by JULES FREUND) *Hixon Memorial Laboratory, Univ of Kansas School of Medicine, Kansas City*

Newcastle disease virus (NDV) caused encephalitis in *rhesus* monkeys The *Manhattan* and *California* strains of NDV (infected allantoic fluid) were inoculated in *rhesus* monkeys through intracerebral, intranasal, intradermal, and intraneural portals Monkeys inoculated in the brain developed fever, gross tremors, ataxia, and occasionally weakness of extremities The *California* strain caused a more severe and prostrating illness than did the *Manhattan* strain Clinical evidence of illness was not observed following other routes of inoculation The pathologic changes consisted of encephalitis, chorioiditis, meningitis and occasionally, myelitis NDV was detected in CNS, but not in blood or cerebrospinal fluid obtained prior to or during the acute period of illness The *California* strain caused illness by brain-to-brain passage in monkeys Specific antibodies appeared in the serum of monkeys during convalescence NDV infected allantoic fluid, in addition to hemagglutinins, contained a distinct complement-fixation antigen which reacted with an antibody in the serum of monkeys convalescent of NDV Serums obtained at various levels of convalescence following NDV encephalitis were studied with the use of complement-fixation and hemagglutinin-inhibition tests These tests complemented each other Complement-fixing antibodies appeared about a week earlier (14th day) than hemagglutinin-inhibiting

antibodies (21st day) Maximal antibody levels were reached usually by the 4th week

Lethal effect in hypersensitive guinea pigs of non-precipitinogenic substance in tuberculin
JANET McCARTER WOOLLEY (introduced by R. J. DUBOS) *Rockefeller Institute for Medical Research, New York City*

Fractions separated by ammonium sulfate precipitation from unheated culture filtrates of human tubercle bacilli have been investigated for biological activity. All fractions have skin potency for tuberculous animals in proportion to their protein content. One fraction (*J_r*, *J. Exper. Med.* 87:229, 1948) has a peculiar specific effect on guinea pigs sensitized with heat-killed tubercle bacilli in paraffin oil: animals given intracutaneously doses equivalent to 0.5 mg of protein develop symptoms of a generalized toxemia and die within 8 to 48 hours. Ten times the amount which would kill sensitized animals did not affect

a normal guinea pig. The substance responsible for this delayed toxic death is neither of the 2 precipitinogenic proteins of the culture filtrate since fractions containing one or both antigens are inactive, nor is it the common polysaccharide of culture filtrates. It is either identical or closely associated with the non-precipitinogenic protein of low sedimentation constant, about 1.0 S, previously found in an Old Tuberculin (67-2, *J. Immunology* 43:85, 1942). Of 14 animals tested with active preparations in doses equivalent to about 0.5 mg of protein, all died or became very weak, but fractions not having the lethal substance even in 3.0 mg doses of protein affected none of 10 animals tested. Thus we have a new phenomenon of hypersensitivity in this type of animal, specifically elicited by a substance which is not a precipitinogenic protein and is actually concentrated during the preparation of an Old Tuberculin. The substance must be part of a very active antigen in the bacterium.

ABSTRACTS RECEIVED TOO LATE FOR ALPHABETICAL INCLUSION IN SOCIETIES

AMERICAN PHYSIOLOGICAL SOCIETY

Ineffectiveness of estrogens in inducing steroid depression in WILLIAM B. LANGAN (introduced by ISRAEL S. KLEINER) *Dept. of Physiology and Pharmacology, New York Medical College, Flower and Fifth Avenue Hospitals, New York City*

It has been reported that estradiol does not induce any signs of a depressed state in *Rana pipiens* (LANGAN, 1947). In order to determine whether or not the ineffectiveness of estradiol is characteristic of estrogens, a series of estrogens and non-estrogens was tested. The substances to be tested were dissolved in sesame oil (except where otherwise noted) and introduced with a single intrapleuropertoneal injection in doses ranging from 1-10 mg. Frogs were kept at temperatures ranging from 16 to 21° C. The inhibition of the righting reflex was selected as the criterion of profound depression. The following substances did not induce any signs of depression: hexoestrol, benzoestrol, diethylstilbestrol, estradiol (aqueous), estradiol benzoate, estradiol dipropionate, estrone, ethinyl estradiol, androstendione, dehydroandrosterone acetate, pregnenolone (aqueous). The following steroids were very effective: desoxycorticosterone acetate and progesterone. A slight effect was observed for methyl testosterone, testosterone (aqueous), testosterone propionate and ethinyl testosterone. The estrogens tested were not effective in producing a state of depression. Also several non-estrogenic steroids were

not effective, whereas progesterone and desoxycorticosterone were most effective.

Localization of frontal oculomotor cortex in the cat ROBERT B. LIVINGSTON *Institut de Physiologie, Ecole de Médecine, Geneva, Switzerland*

Electrical excitation of the sensori-motor cortex of 18 adult cats lightly anesthetized with sodium Amytal gave rise to responses which included pupillary dilatation, retraction of the nictitating membrane, and conjugate or, more often, non-associated movements of the eyes. However, the eye movement responses evoked from these superior and lateral surfaces of the frontal lobes were not sufficiently consistent in appearance or contiguous in topographical representation to suggest an oculomotor representation analogous to the frontal eye field of the primate. On the medial surface of the frontal lobe, on the other hand, was defined an oval area, approximately 2.5 to 3 cm in diameter, centered in front of and slightly dorsal to the genu of the corpus callosum, from which could be evoked responses strikingly similar to those obtained by excitation of the frontal eye field of the monkey. Appropriate electrical stimulation applied to this medial cortex in a series of more than 40 cats permitted the elicitation of the following responses: pupillary dilatation with retraction of the nictitating membrane, responses previously localized to this general region of the cat's cortex by C. N. Woolsey (personal communication), conjugate deviation of the eyes in the horizontal plane, generally to the

side opposite the hemisphere stimulated, and movements of the eye lids Hess has recently elicited head turning as well as eye deviation by excitation of a posterior and inferior zone of this oculomotor area in the unanesthetized, freely moving cat (*Helv Physiol & Pharmacol Acta* 6 731, 1948) Certain other effects, not directly related to the ocular responses, have cortical representation which overlaps this region These include grunting vocalization, coughing, gagging, increased gastro-intestinal activity and respiratory responses

Mode of action of dinitrophenol on O₂ uptake of excised rat brain DAVID B TYLER *Dept of Embryology, Carnegie Inst of Washington, Baltimore, Md*

If the O₂ uptake of the brain in the presence of graded concentrations of dinitrophenol (DNP) is followed at half hour intervals for a period of 2 hours (instead of the usual one hour), 3 effects are seen 1) Low concentrations, up to 2.5×10^{-5} M, that produce only augmentation of O₂ uptake, 2) Intermediate concentrations, 5.0×10^{-5} M to 1.0×10^{-4} M, that first augment and then depress, and 3) High concentrations that produce only inhibition of O₂ uptake With 5.0×10^{-5} M the percentage augmentation is only slightly higher than that obtained with 2.5×10^{-5} M However, with the former concentration inhibition sets in at the end of the first hour, while with 2.5×10^{-5} M no inhibition occurs These results suggest the possibility that DNP is not limited to only one site or mode of action and that the accelerating and inhibitory actions of DNP are due to different mechanisms each requiring distinctly different threshold concentrations Under the conditions of these experiments (minced rat brain respiring in Ringer glucose phosphate media), the threshold concentration for the augmentation phase of action is about 1×10^{-6} M, for the inhibitory phase it is 50-fold higher

AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS

α -Acetolactic acid, an intermediate in acetylmethylcarbinol formation ELLIOT JUNI (introduced by L O KRAMPITZ) *Dept of Microbiology, School of Medicine, Western Reserve Univ, Cleveland, Ohio*

It has been proposed (*Federation Proc* 6 301, 1947) that the formation of acetylmethylcarbinol occurs according to the following scheme $2\text{CH}_3\text{COCOOH} \rightarrow \text{CO}_2 + \text{CH}_3\text{COH}(\text{COCH}_3)\text{COOH} \rightarrow \text{CH}_3\text{CHOHCOCH}_3 + \text{CO}_2$ Cell-free extracts of *Aerobacter aerogenes*, *Bacillus subtilis*, *Staphylococcus aureus* and *Serratia marcescens* have the ability to form acetylmethylcarbinol and carbon dioxide from pyruvic acid and can also decarboxylate α -acetolactic acid to acetyl-

methylcarbinol A crude extract from *Aerobacter aerogenes* has been resolved into 2 components, 1) acts on pyruvic acid to produce α -acetolactic acid and carbon dioxide, 2) decarboxylates α -acetolactic acid but is without effect on pyruvic acid The former is dependent on cocarboxylase Both enzymatically formed and synthetic α -acetolactic acid form the osazone of diacetyl with phenylhydrazine with the formation of one mole of CO₂ per mole of α -acetolactic acid employed Analyses of both derivatives agree with theory Melting points and mixed melting points are identical Under the conditions which the osazone from α -acetolactic acid is prepared, no osazone is obtainable from acetylmethylcarbinol The enzymatically synthesized α -acetolactic acid is decarboxylated with aniline-citrate, and is also decarboxylated by the resolved enzyme component that decarboxylates synthetic α -acetolactic acid This latter component is specific for α -acetolactic acid and will not act upon acetoacetic acid or oxalacetic acid It also shows a specificity for one of the isomers of the racemic mixture of the synthetic α -acetolactic acid Preparations from microorganisms which do not ordinarily produce acetylmethylcarbinol were found to be incapable of decarboxylating α -acetolactic acid An enzyme preparation from pig heart capable of forming acetylmethylcarbinol from pyruvic acid has been obtained which can also decarboxylate α -acetolactic acid to acetylmethylcarbinol

Maximum rate of urea production from various amino acids in the dog HENRY KAMIN* AND PHILIP HANDLER *Dept of Biochemistry and Nutrition, Duke Univ School of Medicine, Durham, N C*

Dogs were given constant rate i v infusions of various amino acids, and blood and urine urea N measured Total urea N formation was calculated as the sum of urea N excreted and urea N accumulated in body water The maximum rates obtained, corrected for urea N production of control dogs subjected to diuresis, are indicated in the table

Maximum Urea Production, as mg N/kg/min

AMINO ACID	UREA PRODUCTION	AMINO ACID	UREA PRODUCTION
L-cysteine	0 05	DL-leucine	0 39
L-methionine	0 05	L-histidine	0 65
L-glutamic acid	0 11	glycine	0 80
L-aspartic acid	0 18	L-asparagine	0 80
L-alanine	0 20	'Amigen'	1 8
L-lysine	0 20	L-arginine	1 9
L-leucine	0 24	L-glutamine	2 8
L-tyrosine	0 35	L-arginine plus 'Amigen'	3 5

Direct analysis of tissue, as well as balance studies, indicated limited permeability of cells to the dicarboxylic amino acids. Liver samples from dogs infused with arginine showed only traces of that amino acid, but large quantities of α -amino N. Liver cells appeared to be freely permeable to the other amino acids, and the data are therefore a measure of the *in vivo* activity of the respective 'deaminases'. No correlation was observed between the *in vivo* rate of urea formation, and the *in vitro* rate of deamination in the isolated systems which have been studied by other workers. The high rate of urea production from glutamine suggests the possibility of a special role for that amino acid.

Synthesis of unusual quantities of pyridine nucleotides by human erythrocytes, *in vitro*
IRWIN G. LEDER,* W. A. PERLZWEIG AND PHILIP HANDLER, *Dept. of Biochemistry and Nutrition, Duke Univ. School of Medicine, Durham, N. C.*

Incubation of washed human erythrocytes suspended in a Ringer-phosphate medium containing glucose and 2% nicotinamide results in an 8- to 10-fold increase in their content of material which behaves like pyridine nucleotides in the fluorometric assay. The material is definitely not N-methylnicotinamide or nicotinamide nucleoside. It cannot be removed from the cells by washing, serves as a growth factor for *H. parainfluenzae* and is destroyed on incubation with a rabbit brain DPNase preparation for 90 minutes. It has not yet been established whether the material is mononucleotide, DPN, TPN or a mixture thereof. Liver slices and yeast suspensions behave similarly although the extent of synthesis is not as great as that observed in red cells. Both inorganic phosphate and glucose are essential in the medium and synthesis is completely inhibited by the usual glycolytic inhibitors, e.g. fluoride and iodoacetate. The synthetic velocity is roughly constant for about 16 hours and maximum synthesis is achieved within 20 hours. The addition of ATP is without effect on either the velocity or the total amount of material formed. Synthesis is dependent on the concentration of nicotinamide and ceases below 0.1% where the rate is only 8% of that achieved in a medium containing 2% nicotinamide. The nicotinamide, therefore, serves both as precursor and as inhibitor of DPNase.

Metabolism of Desoxyribosides in *Escherichia coli*
L. A. MANSON* AND J. O. LAMPEN, *Dept. of Biological Chemistry, Washington Univ. School of Medicine, St. Louis, Mo.*

Previous work with extracts of animal tissues has shown that purine and pyrimidine desoxyribosides undergo a phosphorolytic cleavage identical with that demonstrated for the corresponding

ribosides. In these systems, however, the resulting desoxyribose phosphate esters are not degraded. Washed, resting cells of *E. coli* (A T C 9723) were incubated with hypoxanthine desoxyriboside or thymidine and acid-soluble desoxypentose determined at intervals. In a phosphate or bicarbonate buffer (pH 7.0) the total desoxypentose disappears rapidly and the free nitrogenous base can be recovered in the medium in about 80% of the theoretical quantity. Hypoxanthine, thymine, and D-2-desoxyribose are not metabolized under these conditions. In the presence of arsenate the disappearance of total desoxypentose is slower and free desoxypentose appears in the medium. It is concluded that, in the absence of arsenate, the nucleosides undergo phosphorolysis, yielding the free base and a desoxypentose phosphate. The latter is then degraded by the cells. In the presence of arsenate, both phosphorolysis and arsenolysis occur. That portion of the nucleoside which undergoes arsenolysis yields free desoxyribose. This cannot be degraded and is therefore recovered in the medium. Cell-free extracts of the organism were prepared by grinding the cells with alumina by McIlwain's procedure. These extracts contain potent purine and pyrimidine nucleoside phosphorylases. The 2 phosphorylases appear to catalyze reversible reactions. The extracts do not degrade the desoxypentose phosphate formed from hypoxanthine desoxyriboside or thymidine. Evidently the enzymes involved are either inactivated or are not extracted.

Studies on adhesion and syneresis in fibrin clots

PETER R. MORRISON, ARTHUR L. SEILER AND JAMES M. HEAD (introduced by J. W. WILLIAMS), *Depts. of Physiology and Zoology, Univ. of Wisconsin, Madison*

Adhesion was measured as the force required to separate a disc from the attached substrate. A beam balance modified for automatic loading and kymographic recording of elongation and break with stress was used. This was suitable for different substrates and although technically difficult, interpretation was straightforward. Alternatively the pressure required to separate clot from an attached screen was measured. This limits substrates but is easier and somewhat more precise (average deviation = 5%) although conversion to absolute units is difficult. Adhesion values were surprisingly constant with changes in physical chemical variables. A 100-fold increase in either fibrinogen or thrombin increased adhesion by only 2-4-fold. Broad optima near physiological values were found for both pH and salt concentration with only a 2-fold range for both pH (6.0-8.5) and ionic strength (0.10-0.90). Substrates tested in order of increasing adhesion were silicone, petrolatum, octoil-S, glass, bakelite, collodion, cellophane, protein (heat-denatured fibrinogen),

koroseal, lucite, bakelite (sanded), aluminum, stainless steel, and 'tissue' Syneresis, as compaction under pressure, was followed by measuring expressed fluid at short intervals using a micrometer burette. In contrast to adhesion, values were strikingly influenced by the conditions under which the clot was formed.

Migration of lysine across the cell wall of *Streptococcus faecalis* VICTOR A. NAJJAR AND ERNEST F. GALE * *Unit for Chemical Microbiology, School of Biochemistry, Cambridge, England*

Two factors influence the passage of lysine across the cell wall,—the phosphate ion and the amino acids in the medium. Lysine migration across the cell wall in either direction is markedly suppressed by the presence of phosphate ions in the outside medium. No effect is exerted by chloride, sulfate and pyrophosphate ions. The uptake of lysine is inhibited about 30% both at 4° C and 37° C. However, outward migration is inhibited 100% at 4° C and no inhibition occurs at 37° C. Lysine migration into the cell is inhibited by the presence of various amino acids in the outside medium. The acidic amino acids show 50–75% inhibition and the basic 30–60% inhibition. No inhibition occurs in the presence of neutral amino acids. When lysine is taken up by the streptococcus by incubation in a medium also containing the acidic or basic amino acids, lysine does not migrate to the outside upon reincubation in phosphate but migrates freely in saline. Alternatively, when lysine is taken up in the presence of the neutral amino acids or from lysine solution alone, it migrates equally well in phosphate or saline upon reincubation in these salts. All migration experiments were performed on the resting cell in media of pH 7.2.

Cerebrospinal fluid findings in brain tumors

M. SPIEGEL-ADOLF AND H. T. WICIS * *Depts of Colloid Chemistry and Neurosurgery, Temple Univ., Philadelphia, Pa.*

Valuable information in various pathologic conditions has been obtained through ultraspectrophotometrical studies of the cerebrospinal fluid (CSF), especially in combination with chemical determination of the ascorbic acid and protein content (*Federation Proc.* 6–8, 1947–9, *Science* 109:335, 1949, *Am. J. Psych.* 109:697, 1948). Ultraspectrophotometric studies have been extended to a group of 40 CSF's in cases of tumor of the CNS. In 30 of these cases, the ascorbic acid (Robinson-Stotz's method) and the protein content were determined simultaneously. Twenty new controls of non-tumor cases have been added to the previously published 40 control cases. Besides, in 14 cases corresponding brain tumor extracts (*Arch. Path.* 44:307, 1947) could be prepared and

spectrographed. The extinction coefficients (E_{260}) of the tumor CSF's lie for the most cases between 2.0–4.6 while in the control cases the average values are $1.24 \pm .59$. After correction especially for ascorbic acid, 77% of the CSF's from tumor cases reach values above $E = 8$. Only 20% of the controls reach similar values after the same correction, while in about 50%, the E values are below 0.4. There is a certain parallelism between the E values of CSF's and those of the corresponding tumor extracts. A comparison of the CSF findings with the clinical data (size and location of the tumor, intracranial pressure) seems to indicate that the high E values are not only due to metabolic processes in the tumors but also to destruction and/or impairment of the brain tissue.

Ultraspectrophotometrical studies of irradiated mouse tumors M. SPIEGEL-ADOLF AND M. E. SANO * *Dept. of Colloid Chemistry and Tissue Culture, Temple Univ. School of Medicine, Philadelphia, Pa.*

The effects of x-ray radiation upon spontaneous tumors of hybrid mice were studied by physical, chemical and histological methods. In 40 tumor mice, the mammary carcinomas alone were irradiated with dosages varying between 300–4800 R. The rest of the animal was shielded. Control experiments showed that mice in which a benign tumor was irradiated as above, gained weight and apparently stayed in good health. The irradiated tumors were extracted as described before (*Arch. Path.* 41:307, 47) and the extracts ultraspectrographed. Ten non-irradiated mouse tumor extracts show average E_{260} values $= 2.1128 \pm .27$. If the extinction values at E_{260} of the irradiated tumors are plotted against the dosage, a graph is obtained that reaches the minimum of the E values at 900 R and returns after 1800 R to non-irradiated values. Further irradiation seems to be without effect. Gross pathology and histologic controls show comparable results. The tumors become smaller, hemorrhagic, picnotic, necrotic. After higher dosages new growth develops. Only the tumors under direct irradiation show the above mentioned changes of extinction coefficient and histology. Non-irradiated secondary tumors apparently remain unchanged. In 3 cases the irradiated tumors practically disappeared after dosages of 900–1500 R. New growths developing after 2 months did not respond to further irradiation of 1500 R. Contrary to references in literature protracted irradiation did not increase the incidence of lung metastasis. In an attempt to identify the substances causing the absorption at 260 m μ with nucleic acids, the optical studies have been supplemented by microchemical N and P determinations.

New nucleosidases in *Lactobacillus pentosus*

T P WANG (introduced by J O LAMPEN) *Dept of Microbiology, School of Medicine, Western Reserve Univ, Cleveland, Ohio*

New types of purine and pyrimidine nucleosidases have been demonstrated in *Lactobacillus pentosus* 124-2. Cell-free extracts prepared by grinding cells of *L. pentosus* with glass show the following new reactions: Adenosine + phosphate → adenine + ribose-phosphate, cytidine + phosphate → cytosine + ribose-phosphate, and xanthosine + phosphate → xanthine + ribose-phosphate. The evidence for the direct phosphorolysis (or arsenolysis) of adenosine and cytidine is: 1) one mole of reducing sugar was obtained per mole of nucleoside disappearing, 2) the spectral changes during the process corresponded to the respective listed, 3) no adenosine or cytidine deaminases could be demonstrated in this extract, (This excludes the possibility that these nucleosides are first deaminated and then undergo phosphorolysis) 4) the free bases were identified as follows: adenine as adenine picrate and cytosine by paper chromatography. The phosphorolysis of xanthosine was shown by the formation of reducing sugar and by the spectral changes which corresponded to the conversion to xanthosine to xanthine. Under the same conditions no reducing sugar was obtained with either xanthosine alone or xanthosine and heated extract. Uridine, guanosine and inosine also undergo phosphorolysis or arsenolysis with this extract. The relative rates are: uridine, cytidine > inosine > adenosine > guanosine > xanthosine. Thus, phosphorolysis is faster with the pyrimidine than with the purine nucleosides. A comparison of the rate of cleavage of uridine and cytosine in phosphate, arsenate and tris - (hydroxymethyl - aminomethane buffers, pH 7.5) indicates that these nucleosides are split by

phosphorolysis or arsenolysis rather than by simple hydrolysis.

AMERICAN INSTITUTE OF NUTRITION

Diminished ACTH production in rats on low protein diets, explanation of relationship between dietary protein and renal hypertension PHILIP HANDLER AND FREDERICK BERNHEIM *Depts of Biochemistry and Nutrition and of Physiology and Pharmacology, Duke Univ School of Medicine, Durham, N C*

The systolic blood pressure of subtotally nephrectomized rats falls to normal levels after a few weeks on an 8% casein diet. No single amino acid deficiency appears to be specifically responsible. The administration of 1 mg of ACTH promptly raises the blood pressure to the level maintained by rats receiving a 35% casein diet while ACTH is without effect on the pressure of the rats eating the high protein diet. ACTH also raises the pressure of rats eating a low protein, salt free diet to the levels found in rats eating a high protein, salt free diet, but is without influence in the latter group. Further, ACTH is without effect on the blood pressure of unoperated rats, regardless of diet. To determine whether 705-2-15-50 FP 5541 p 587 Take 2-16-3C Gal 21 rats on low protein diets are actually 'hypopituitary' with respect to ACTH production, 0.2 mg of epinephrine was given intraperitoneally to both operated and unoperated rats on high and low protein diets. The percentage fall in the circulating eosinophile count, 4 hours later, was measured as an index of ACTH activity. The fall in the low protein rats was less than half that observed in the high protein rats while both groups responded to ACTH itself. It is concluded that the normotension of partially nephrectomized rats on low protein diets is, in large measure, the result of a diminished ACTH production.

The CARE and BREEDING of LABORATORY ANIMALS

Edited by EDMOND J. FARRIS, *The Wistar Institute of Anatomy and Biology*. With 15 contributors. This book answers the numerous questions asked by those engaged in breeding and caring for laboratory animals. Each chapter, written by a qualified expert, covers care and housing, reproduction, developing breeding stock, sanitation, nutrition and feeding directions for a particular species. The book contains all information necessary to raise the rat, opossum, monkey, rabbit, cat, mouse, dog, pig, birds (chicken), reptiles, amphibians, fish, ferret, hamster, and drosophila.

The TRANSMISSION of NERVE IMPULSES at NEUROEFFECTOR JUNCTIONS and PERIPHERAL SYNAPSES

by ARTURO ROSENBLUETH, *Instituto Nacional Cardiología de México*. This book presents in systematic form the knowledge of chemical transmission at the junctions of motor nerves with striated muscles and at the synapses in autonomic ganglia. It covers all the important advances made in the field since 1937 when the author and Dr. Walter B. Cannon published a monograph on the subject. This is the first comprehensive review and criticism of the evidence which leads to the important inference that acetylcholine is the chemical mediator at autonomic ganglia and neuromuscular junctions. A complete bibliography of the subject is included.

A H T CO SPECIFICATION

METABOLISM OUTFIT

6412.

METABOLISM OUTFIT FOR THE DETERMINATION OF CALORIE PRODUCTION AND BASAL METABOLIC RATE BY THE DOUGLAS METHOD, with Haldane-Henderson-Bailey Gas Analysis Apparatus This is the simplest of the satisfactory methods for the study of gaseous metabolism. It is not limited to an observation of reduction in oxygen volume, but depends upon the collection and analysis of a sample of expired air. Outdoor air (O_2 content 20.99%, CO_2 content 0.03%) is inspired through a flutter valve and mask, or mouthpiece and nose clip, and returned on expiration through a second valve, tubing and three-way aluminum stopcock to a Douglas bag. From the air so collected during a six-minute interval one or two samples are taken over mercury in gas sampling tubes. The bag is emptied through a meter and the volume, temperature and barometric pressure are noted. The sample is analyzed in a Haldane-Henderson-Bailey Gas Analysis Apparatus and its CO_2 and O_2 content determined. From these data there may be calculated the hourly oxygen consumption, carbon dioxide production, total calorie production and respiratory quotient. From these and the height, weight, age and sex of the patient a comparison can be made with the normal and the basal metabolic rate can be computed.

See T. M. Carpenter, *Carnegie Institution of Washington Publication 216, 1915, p. 67*, Douglas, *Journal of Physiology, 1911, XLII*, Boothby and Sandiford, "*Laboratory Manual of Basal Metabolic Rate Determinations*", and T. M. Carpenter, *Carnegie Institution of Washington Publication No. 303-A, 1924*.

6412 Metabolism Outfit for the Determination of Calorie Production and Basal Metabolic Rate by the Douglas Method as above described, consisting of Haldane-Henderson-Bailey Improved Model Gas Analysis Apparatus, Gas Meter, Douglas Gas Bag 150 liter, 1 face Mask, Double Douglas Valve, Three way Tap of aluminum, Bailey Gas Sampling Bottle, Thermometer range 10 to 50 C in 1 rubber tubing clamp and thermometer holder, complete with directions for assembling and for use. 448 45

now
you can collect fractions economically

with this new

TIME/FLOW **fraction collector**

FOR routine laboratory fractionation, where the finesse and ultimate-degree precision of the Technicon automatic drop-counting collector exceeds the requirement of the task, this new flow-rate collector is an efficient and economical instrument. Based on a sound rate-of-flow principle, the time-controlled mechanism will automatically collect any number of samples up to 200 any predetermined volume-per-sample up to 25cc.

As each fraction is collected, the carriage automatically advances to repeat identical collections consecutively until the whole fractionation has been made. When speed is essential, a tandem-collector (optional) can be hooked-in to double output. The Technicon Flow-Rate Collector is completely automatic, requires no attention during operation. Set it for the given experiment and go away; it will shut off automatically on completion of the fractionation. Send the coupon below for details.

SAVES TIME AND LABOR

completely automatic, it
frees laboratory techni-
cians for more productive
tasks than fraction cutting

IMPROVES RESOLUTION

by collecting a larger num-
ber of smaller samples, re-
sulting in sharper demar-
cation

TRIPLES WORK OUTPUT

It will run twenty four
hours a day, as against a
standard eight hour labo-
ratory work day

Technicon **automatic *TIME/FLOW* fraction collector**

MODEL 3C STIMULATOR

A GENERAL PURPOSE PHYSIOLOGICAL STIMULATOR

The accuracy and versatility of this square-wave stimulator allow its use without monitoring in a wide variety of nerve, muscle and cortical stimulation problems. Frequency, duration and voltage of the stimulus are independently variable and each is accurate to better than 5%. The stimulus has a variable time delay from the cathode-ray synchronizing pulse. This stimulator gives single, groups or continuously repetitive pulses, and in combination with a similar stimulator, gives two pulses whose separation, duration and voltage are all independently variable.

Stimulating electrodes of various types are available.

Grass Instrument Company also manufactures

Preamplifiers — used extensively in nerve-muscle physiology in conjunction with commercial cathode-ray oscilloscopes having some amplification,

Electroencephalographs — used clinically and in experimental neurophysiology and pharmacology,

Electrodes — scalp type for recording the EEG. Cortical electrodes for recording the ELG from exposed brain in animals and humans, and depth electrodes for stimulating, recording and injecting fluids into the depths of the brain.

Write us for full specifications on any of the above.

Prompt delivery on most items.

are offered for subscription on a yearly basis

Abstracts are classified under the headings Biological agents, Electrical and electronic equipment, Fungicides and other toxic compounds, Lacquers, paints, and varnishes, Leather, Lubricants, Metals, Miscellaneous, Optical instruments and photographic equipment, Packaging and storage, Plastics, resins, rubbers, and waxes, Textiles and cordage, and Wood and paper One volume of approximately 2000 loose-leaf pages is published each year in monthly issues Subject and author indexes are compiled annually to cover abstracts issued from July through June The yearly rate of \$50 00 includes two sturdy binders and index tabs

An ADVANCE LIST, a monthly bibliography of all reports received in this field, is available for \$10 00 a year

for reproducible blood counts

YANKEE PIPETTE SHAKERS

Designed to meet all requirements for proper mixing of blood samples, and to give consistently uniform blood cell counts. With the Yankee Pipette Shaker, **reproducible results are obtained in repeated tests using the same sample of blood**

Shaking action is limited to one plane only—the vertical, horizontal motion is practically eliminated. Complete mixing is produced in 30 seconds without hemolyzing the blood cells. The shakers operate on 120 volts AC only. They include a built-in adjustable timer. Heads of the six unit and two unit models are interchangeable.

NEW! 6 unit model A-2290/6

Design of head insures that each pipette undergoes exactly the same shaking action.
Each \$40 00

2 unit model A-2290

FULBRIGHT PROGRAMS

for

*International
Educational Exchange*

PROGRAMS FOR 1951-52 Awards are now available to United States citizens who wish to go abroad as visiting lecturers or advanced research scholars Applications for awards must be submitted between June 15 and October 15, 1950 As a result of the signing of new agreements and the corresponding establishment of new country programs, applications may be submitted for any of the countries listed below

Australia	Italy
Belgium-Luxembourg	Netherlands
Burma	New Zealand
Egypt	Norway
France	Philippines
Greece	Turkey
India	United Kingdom
Iran	and Colonies

TRAVEL GRANTS FOR FOREIGN LECTURERS It is possible to secure travel grant assistance for specific foreign lecturers to come to the United States for the academic year 1951-52 Availability of awards will depend upon the country If you are interested, write to the Conference Board Committee for information

J. S. CANNER COMPANY

909 Boylston Street
Boston 15, Massachusetts

AAAS CLEVELAND MEETING

DECEMBER 26-30, 1950

The 117th Meeting of the American Association for the Advancement of Science will be full-scale. All 17 of the Association's sections, and about 40 scientific societies, will hold more than 200 sessions in the Public Auditorium and downtown hotels (Statler, Hollenden, Carter, Allerton) of Cleveland. The *Annual Science Exposition*, filling the arena of the Auditorium, will be the largest and most diversified in the history of the Association.

A number of the programs will be of particular interest to those in the fields of medicine and experimental biology. These are:

Sections B, F—Physics, Zoology Scientific Implications of Nuclear Phenomena in the Field of Biophysics, part of a three-session symposium, *afternoon, December 28*

Section C—Chemistry Two (of the 12) sessions on steroid hormones, program arranged by Hal G. Johnson, Monsanto Chemical Co., *morning and afternoon, December 28*

A third session on medicinal chemistry, arranged by Herbert Carter, University of Illinois, *evening, December 29*, Chemists' luncheon, *December 30*

Section F—Zoology, jointly with American Society of Zoologists Symposium on Genetics and Behavior, *afternoon, December 29*

Subsection Nm—Medicine Four-session symposium on Biological Effects of Radiation, *mornings and afternoons, December 29, 30*

Subsection Nd—Dentistry Three sessions on the dental research of all branches of the Federal government, *evening, December 29, morning and afternoon, December 30*

Subsection Np—Pharmacy, jointly with the American Pharmaceutical Association, Scientific Section Four sessions of papers, *mornings and afternoons, December 28, 29*

Oak Ridge Institute of Nuclear Studies, jointly with Oak Ridge National Laboratory Two sessions, *morning, afternoon, December 28*

American Society of Parasitologists Paper-reading sessions, *December 27-29, inclusive*, luncheon, demonstrations, *afternoon, December 28*

American Society of Protozoologists Paper-reading sessions, *December 27, 28, inclusive*, luncheon, *December 29*

American Society of Zoologists Symposium on Transition from Aquatic to Land Life, *afternoon, December 27*, demonstrations, *afternoon, December 28*, paper-reading sessions, *December 28-30, inclusive*, Zoologists' dinner, Biologists' smoker, *evening, December 29*

Society of Systematic Zoology Symposium, *evening, December 27*, breakfast meeting, *afternoon business meeting, December 29*

American Microscopical Society Two sessions, *morning and afternoon, December 29*

Biometric Society, Eastern North American Region Six paper-reading sessions, *December 27-29, inclusive*

Society of Industrial Microbiologists Two sessions, *afternoons, December 28, 29*

American Dietetic Association Session, *evening, December 29*

Alpha Epsilon Delta, Premedical Honor Society Annual Luncheon, *December 28*

SPECIAL SESSIONS (INCOMPLETE)

AAAS Presidential Address by Past President Elvin C. Stakman, Reception, *evening, December 28*

Society of the Sigma Xi Annual Lecture, Ralph W. Wyckoff, The Macromolecular Texture of Biological Materials, *evening, December 27*

United Chapters, Phi Beta Kappa Annual Address, Speaker, Detlev W. Bronk, *evening, December 29*

★ ★ ★

Housing Coupons for hotel reservations will appear in *Science*, beginning with the issue of August 25, and in *The Scientific Monthly*, beginning with the September number.

Registration At the meeting. Main Registration at Auditorium, other facilities at Hotels Statler and Hollenden, fees, \$2.00 for members of the AAAS, spouses, *bona fide* students, \$3.00 for nonmembers. *Advance Registrants* will receive the General Program, by first-class mail, early in December—Coupons for advance registration also in *Science* and *S.M.* For further information communicate with Dr. R. L. Taylor, Assistant Administrative Secretary, AAAS, 1515 Massachusetts Avenue, N.W., Washington 5, D.C.

International Refrigerated Centrifuge

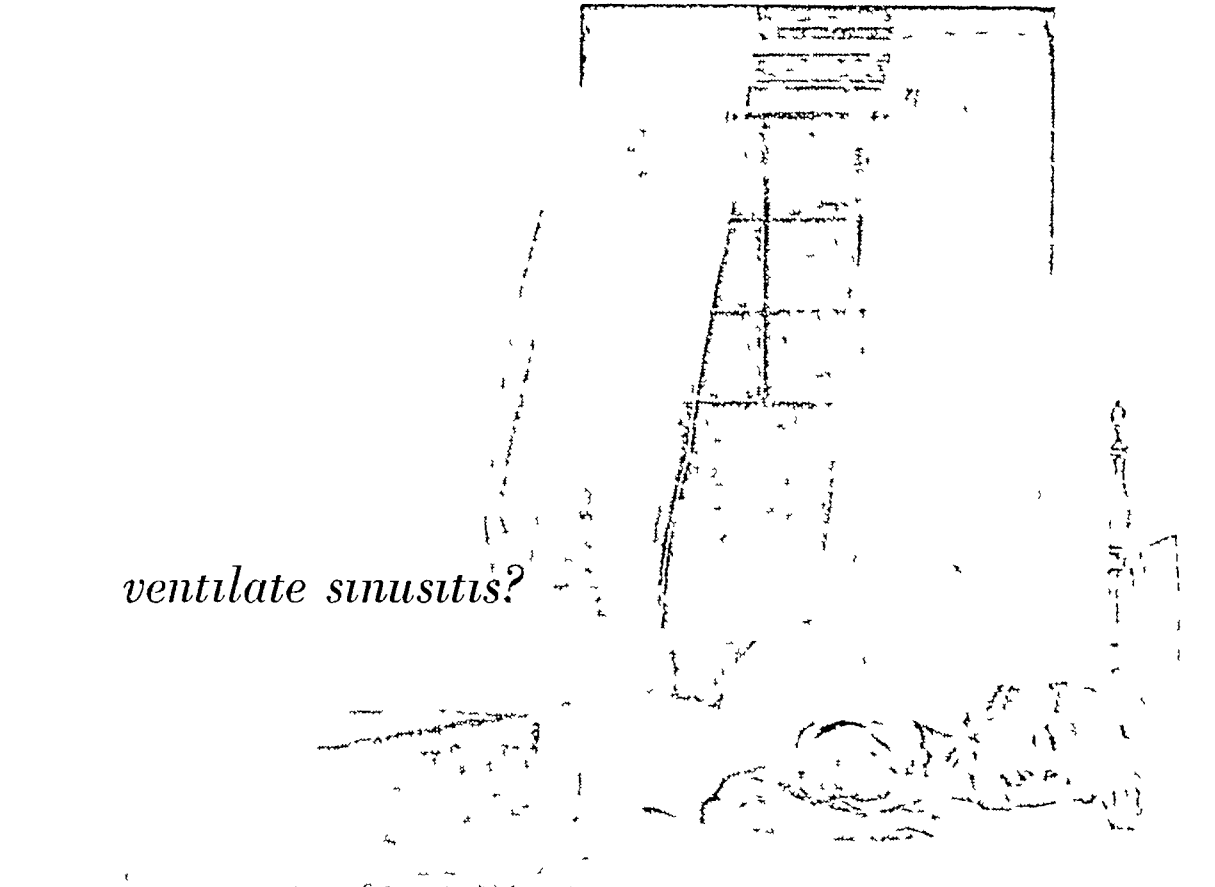

Centrifugation under controlled temperatures at or well below 0°C offers new possibilities to the biochemist. The cancer program—virus investigations—poliomyelitis research—enzyme research—low temperature solvent fractionation—all have benefited by the use of this new research tool. Countless other applications are waiting the guidance of the research scientist.

The International Portable Refrigerated Centrifuge, Model PR-1, is now equipped

with a larger capacity compressor. Centrifuge speeds and capacities remain unchanged but much lower controlled temperatures are now possible. For example, with six 100 ml tubes at 5000 r p m, temperatures as low as -15°C can be maintained with four 250 ml bottles at 2600 r p m, -8°C with four 25 ml tubes at 18,000 r p m, -5°C .

Here is a scientifically designed research instrument definitely worth investigating. Write for descriptive Bulletin RC, 1949.

Boston 35, Massachusetts

ventilate sinusitis?

THE dark, dank breeding ground of a clogged sinus is ideal for organisms but not for the patient. Shrinkage of nasal mucosa opens an airway, permits drainage, relieves discomfort, and admits penicillin for concentrated, localized activity. This may now be rapidly achieved for long periods without the disadvantages of earlier epinephrine like decongestants. To combat infection and to provide comfort with only the slightest degree of restlessness or sleeplessness, without irritation, ciliary interference, or secondary engorgement, prescribe

'Clopane Hydrochloride' with Penicillin—G

AMERICAN ASSOCIATION OF IMMUNOLOGISTS

Symposium on Coxsackie Group of Viruses¹

Chairman GILBERT DALLDORF

THE COXSACKIE VIRUSES

GILBERT DALLDORF

From the Division of Laboratories and Research, New York State Department of Health

ALBANY, NEW YORK

IT SEEMS TO BE SOUNDLY ESTABLISHED that what we have called the Coxsackie viruses are common infections of man. The speakers that follow me will discuss the typing of various strains of Coxsackie viruses, their behavior in complement-fixation tests, their isolation under various circumstances and something of the nature of the human disease with which they have been associated (1).

It will be well to bear in mind that we are sadly deficient in our understanding of the human disease and know nothing regarding the lesions, if any, in man. That is why it seemed unwise to give the virus a descriptive name.

It may prove to be significant that the strains we have studied so far can be readily classified in two groups on the basis of the experimental disease (2). This may easily and definitely be done by histologic examination. *Group A* includes strains that induce lesions only of the skeletal muscles. *Group B* strains also cause lesions in the brain, sometimes in the fat pads, heart and other organs. We find the two kinds of Coxsackie virus differ in size and other respects. In our work it has been an advantage to be able to distinguish between the two and I suspect others will find it equally helpful.

So far these agents have been found associated only with man, in human feces and throat washings, in sewage and in flies trapped near human habitations. They have not been found as natural

infections in other animals. They have commonly been associated with epidemics of poliomyelitis or poliomyelitis-like disease. The association of Coxsackie and poliomyelitis viruses deserves attention and poses several interesting questions.

Our experience in New York during the past 3 years has been that Coxsackie virus may sometimes be found in the feces of poliomyelitis patients, sometimes alone, sometimes in combination with poliomyelitis virus. The data we have indicate that infection has distinct epidemiologic patterns, is largely limited to the young (the age distribution is similar to that of poliomyelitis some years ago), and is associated with symptoms indistinguishable from those of poliomyelitis. At any rate, we have not been able to distinguish between the symptoms and signs in the patients from whom we can and cannot isolate Coxsackie or poliomyelitis virus. This may simply mean that the Coxsackie viruses flourish during the summer months and have little clinical effect, that the disease we see is due in large measure or entirely to poliomyelitis virus.

Others have found Coxsackie virus associated with outbreaks of diseases of a different kind. It may be noted that so far these reports have been of *group B* virus infections. Dr. Kilbourne will describe such an outbreak. The observations of Curnen, Shaw and Melnick have much in common. We should look for Coxsackie viruses in several diseases for they seem to be associated with diverse clinical conditions.

COMPLEMENT-FIXATION TESTS WITH SOME OF THE VIRUSES IN THE COXSACKIE GROUP¹

JORDI CASALS AND PETER K. OLITSKY

From the Laboratories of the Rockefeller Institute for Medical Research

NEW YORK CITY

AN EARLY INTEREST of the writers concerned possibilities of laboratory diagnosis of the viruses comprised in the group designated by Dalldorf (1) as Coxsackie. While other members of the Symposium will discuss various methods of detection and identification of the viruses, this presentation is limited to complement-fixation tests. For the purposes of the study 4 laboratory strains of viruses of this group have been used: *type 1* (Dalldorf) (2, 3), *type 2* (Dalldorf) (2, 3), Conn 5 (4) and 1135K (5). Other colleagues of the Symposium will hold forth on the problem of the taxonomy of these agents: whether they are distinct, independent viruses or whether they are strains of the same virus. It is, however, of considerable interest that the viruses here employed have dissimilar properties in the experimental animal and that *type 1* was isolated from the feces of a child with a diagnosis of paralytic poliomyelitis, *type 2* and Conn 5, from stools of patients considered as cases of non-paralytic poliomyelitis, and 1135K, from the throat washings of a patient having an acute, febrile, influenza-like illness and whose chief complaint was abdominal pain (6). Only the future will tell whether one is dealing with a disease of protean manifestations, assuming a wide variety of clinical syndromes or whether the illnesses encountered, from which the Coxsackie viruses have been recovered, are different nosological entities caused by different viruses. From the results of the present investigations it would appear that, conforming with the designations commonly made by Dalldorf (1, 2), Curnen (6), Melnick (4) and others, the use of the term 'group of viruses' would at this time be preferable.

These facts are mentioned because they have bearing on the subject of complement fixation as

a test for detection of specific antibody in the serum of individuals or for identification of a particular virus. An antigen used in such tests primarily a) should be free from any nonspecific reactions since so many agents, be they strains or different viruses, have already been recovered, b) should have a maximal titer, i.e. should be powerful enough to detect the smallest quantity of specific antibody, and c) should be practical and simple, easy to adapt to ordinary laboratory equipment or field conditions and to available technical assistance. It is believed that such an antigen can readily be prepared, its preparation and the details of a complement-fixation test with it has already been described (7).

Several reports have appeared since then by others describing a diversity of methods for performing this test with Coxsackie viruses. Thus Howitt and Benefield (8) have used unfractionated suspensions of infected, isolated muscle repeatedly frozen and thawed. Melnick and co-workers (4, 9) have devised antigens prepared by high-speed centrifugation and precipitation by protamine combined with a microtest performed on lucite plates, the readings being plotted and the area under each curve determined by means of a planimeter. Recently Manire, Sulkin and Farmer (10) have described antigens made from suspensions of infected mouse muscle either uncentrifuged or as supernate fluid after centrifugation at 2500 rpm for 30 minutes.

The method adopted for the preparation of antigens now used in this laboratory for the Coxsackie viruses, and the details of the procedure of the test are those that have already been applied to neurotropic viruses in general (11). The preparation of an antigen is based on successive extractions of infected tissue with acetone and ethyl ether, after drying, the final residue is suspended in saline solution to a concentration of 3:1 with respect to the original wet tissue weight. The use of acetone-ether extraction is considered necessary since known Wassermann positive sera react with normal, nonextracted

¹ We are grateful to Major L. C. Murphy, V. C., U. S. Army and Professor Italo Archetti of our laboratory and to Drs. G. Dalldorf, E. D. Kilbourne and R. M. Taylor for their valuable cooperation.

tissue, thereby giving rise to false positives. Following extraction, however, nonspecific reactions are eliminated in most instances or they are reduced to such a degree that a practical specific test results (table 1). The tissue from which the antigen is made is obtained from Swiss-W, infant mice which are etherized to death. Either the muscle can be stripped off the bones, which is difficult, or the entire limb can be used which is a simpler method and yields as good

readily prepared so that a one-way test can be performed, i.e. a test to reveal antibody in 1135K antiserum against antigens other than 1135K. The antiserum is then found to contain antibody reactive against Conn 5 virus but not against *types 1* and *2*. In addition, *types 1* and *2*, and Conn 5 each appears to be antigenically specific (table 2, which shows a test with mouse antiserum). The relationship of 1135K virus to that of Conn 5 is further discussed by Dr

TABLE 1 REACTION OF HUMAN WASSERMANN-POSITIVE SERA WITH ACETONE-ETHER EXTRACTED AND NON-EXTRACTED ANTIGENS

7	0	0	0	0	0	0	4	4	2	0	0	0	0

results. Brain tissue, owing probably to a low content of virus, does not produce effective antigens.

By this method antigens can readily be obtained with *type 1* and *2* from infected mice up to 14 to 15 days of age at the time of infection, best results, however, follow the injection with virus of 6- to 7-day-old animals, for the tissue of such mice yields an antigen of higher titer which exhibits least anti-complementary effects. In addition, mice are injected intraperitoneally and infected tissue harvested on the third or fourth day.

On the other hand, mice are relatively less susceptible to the effects of either Conn 5 or 1135K viruses. In these instances animals 1, 2 or 3 days old are needed, for older ones either fail to be affected or develop mild illness from which they can recover. With the limb tissue of such mice an effective antigen can be prepared with Conn 5 virus. Up to the present time, and work is still in progress, no usable antigen has been obtained with the 1135K virus. The probability is that a sufficiently large amount of virus per unit weight of tissue has not yet been secured. Anti-serum against this virus can, however, be

TABLE 2 A COMPLEMENT-FIXATION TEST WITH COXSACKIE VIRUS

1135K limb	0	0	0	0

Kilbourne, a member of this Symposium who first isolated the former active agent.

Immune sera to be used as positive controls for testing antigens are prepared by the repeated intraperitoneal injections of 0.5 cc. of 10⁻⁴ dilution of suspensions of infected limb tissue into 50- to 60-day-old mice. The inoculations are repeated 4 times at 3-day intervals and animals are bled for serum collection 7 to 10 days after the last injection. The other half of the inoculation of material for the complement fixation tests have already been reported (12, 7) and offers an example of the method.

On the basis of the

as described here, 60 sera were studied which were obtained from 28 human beings, several of whom were bled more than once. The individuals from whom specimens were secured fell into 3 groups: 1) laboratory contacts, i.e. those exposed during the course of handling the viruses, 2) patients with various illnesses now suspected as being of the Coxsackie types and 3) persons having no recollection of such illness or of contact with the virus. Of the first group, viz. laboratory contacts, there were 7, the serum of all was positive: all reacted with *type 1*, 6 also against Conn 5, and 4 also against *type 2* antigens. As already stated, no satisfactory antigen of the 1135K agent is as yet available. The results are interesting in view of the fact that the personnel

persons who had no history of illness suspected as being the Coxsackie types nor known contact with the virus. Of these the serum of only 3 could be collected for study: none reacted with *type 2*, one with *type 1* only, one with *type 1* and Conn 5, and the third, with none of the 3 antigens. In table 3 is shown a series of selected 8 cases which are illustrative of the results obtained with the aforementioned 3 groups of tests.

From the results of the present studies it appears therefore that the complement-fixation test performed under controlled conditions offers a means for determining the presence of antibody in sera of man and experimental animals and for measuring its relative amount. The results were generally confirmed in later reports by others.

8	No contact or recognized infection	0	0	0	0

of the laboratory was exposed to all of the 4 viruses, and most active work being carried on with *type 1*. The second group comprised persons from a wide geographic distribution. Our thanks are due Dr. R. M. Taylor for the specimens from Iceland, to Miss B. F. Howitt for the ones from Texas and to Dr. F. P. Nagler for those from Prince Edward Island, Canada. Of the serum of 18 individuals, 11 were tested with *type 1*, 2 and Conn 5 antigens: one was positive with all of them, 4 with *type 1* and Conn 5 only, 5 with *type 1* only and the eleventh was negative with all 3. Seven were tested with *type 1* and 2 antigens: 5 were positive with the former and all negative with the latter. It is noteworthy that complement-fixation antibody against *type 1* virus is generally more commonly met with here than against the others. The third group consisted of

The pattern of antibody level in several neurotropic virus infections runs along the following lines: neutralizing antibody appears, as a rule, early after exposure to a virus, rapidly reaches a high level and then either remains on a higher or lower plateau for a considerable period of time, perhaps for the life of the individual. With the complement-fixing antibody, however, the course is often different. Here, the antibody arises somewhat later, reaches promptly its highest level and then, in a matter of months, slowly diminishes to complete extinction. Whether the same pattern of antibody production is followed by the Coxsackie viruses cannot be determined at the present time.

It will be observed that in certain instances in which paired sera were available, the complement-fixing antibody showed an increase cor-

related with the course of the infection, after the manner of a specific antibody response. At the same time several specimens exhibited positive reaction to more than one antigen. In view of the specificity of the antigens as revealed by control tests with normal sera and prepared, known antisera, such reactions are considered to be essentially not cross reactions, but rather specific responses to the antigens in question.

It is clear, as shown here and by the work of others, that the Cocksackie viruses are widely distributed and that infection with them is not uncommon. Many persons show positive reactions for serum antibody among whom are those who have no recollection of contact with the virus or of suspected illness. Infection is, moreover, easily contracted as noted by the large incidence of positive reactions in workers handling the virus, several of whom have been unaffected by illness during this period of contact, although it is difficult to state this as cause and effect since

these persons may have been positive before they came in contact with the viruses (viz. Curnen (6) for several clinically recognizable laboratory infections). The situation in the case of Cocksackie viruses is one that has similarities with that of poliomyelitis virus in which a large percentage of apparently normal human beings sooner or later develop antibody.

Since subclinical infections with the Cocksackie viruses may be a common occurrence (2, 4, 8) and in view of the fact that such infection leaves its signature in antibody production, it is clear that an antibody test per se on a single sample of serum or even on repeated samples is not a means for diagnosis, unless it can be shown by examination of sera deriving from early stages of a suspected illness and from later convalescent periods that there has been a distinct rise in antibody which is correlated with the course of the disease.

ISOLATION AND DIFFERENTIATION OF THE COXSACKIE GROUP OF VIRUSES

BEATRICE F. HOWITT

From the Communicable Disease Center¹, Public Health Service, Federal Security Agency

ATLANTA, GEORGIA

DURING THE PAST YEAR AND A HALF, material has been received either from sporadic cases or from groups of patients showing ill-defined clinical pictures such as mild fevers, poliomyelitis-like, encephalitis-like, or influenza-like syndromes. At first it was thought (1) that these cases might have some relationship to Newcastle Disease of chickens but since this virus was never isolated and as it was shown that the positive neutralization tests were due to a non-specific heat labile factor in the human sera, (2) this idea was abandoned. Following the report by Dalldorf and Sickles, (3) on recovery of the Coxsackie group of viruses from human feces, (4, 5) all the available material on hand was inoculated into suckling mice. Coxsackie viruses were recovered from the feces and nasopharyngeal washings of many of these patients. Subsequently more specimens were examined from various sources, and strains have been recovered from 105 individuals in 10 different states, Alabama, Colorado, Delaware, Florida, Georgia, Louisiana, Oklahoma, South Dakota, Tennessee and Texas.

METHODS

1) *For Isolation of Viruses* The fecal and oral specimens were prepared according to a previously described method (6). Twenty per cent suspensions of feces were made in distilled water and run in the angle centrifuge $\frac{1}{2}$ hour at 13,000 rpm in the cold room. One thousand units of penicillin and 10 mg of streptomycin were added for each ml of the supernatant fluid and the mixtures were left at room temperature for $\frac{1}{2}$ hour before inoculation of 3- to 4-day-old mice. Each animal received 0.01 ml intracerebrally, 0.03 ml intramuscularly and 0.03 ml intraperitoneally of the treated feces. The oral washings were treated in the same manner, except that the antibiotics were reduced to $\frac{1}{2}$ the quantity.

If the mice showed muscle paralysis or were

prostrate after 3 or 4 days' incubation, they were killed and the skeletal muscles removed. Because a higher concentration of virus was found in the muscles, Seitz filtrates of the latter tissues were used for all future work.

2) *Immune sera* were produced by inoculation of mice, guinea pigs, hamsters, rabbits or monkeys with either brain or the filtered muscle suspensions. An effective serum was obtained in about 3 weeks by bi-weekly intravenous injections of rabbits with filtered infected mice muscles.

3) *Neutralization tests* were performed according to the method in the U. S. Army Laboratory Manual (7), except that the serum-virus mixtures were incubated for 20 minutes at 37° C and held for 20 minutes in the cold room before inoculating 0.03 ml intramuscularly into 3- to 4-day-old mice. All sera were inactivated at 56° C for 30 minutes before use. Although the virus strains had LD₅₀ titers of between 10⁻⁵ and 10⁻⁸, many undiluted sera gave such high protection that a neutralization index often was not obtained when only 2 or 3 dilutions of virus were used. In tests reported as positive, however, the serum neutralized at least 1000 LD₅₀ doses of virus. Occasionally, the tests were performed on different dilutions of sera against a constant amount of virus, usually 100 LD₅₀ doses.

4) The methods used for the complement-fixation tests have been recently described (8). Filtered mice muscles were used for antigens and the tests were performed according to a modified Kolmer technique with over-night fixation in the cold.

VIRUS ISOLATIONS

The first 5 viruses that gave symptoms of muscle paralysis in suckling mice were isolated from human feces at monthly intervals from October 1948, to January 1949. After these original isolations of the Coxsackie virus, a systematic study was made of all material remaining from the earlier collections beginning with 1947 and continuing through 1949. This material had been kept frozen at either -10° C or -60° C and in

¹ Contact nurses

Six of these 12 fatal cases were diagnosed as having poliomyelitis. Poliomyelitis and Coxsackie viruses were recovered simultaneously from the spinal cord of one of these patients. They were obtained also from the feces of 2 other non-fatal cases. It may be seen likewise that the same type of virus was recovered twice from 3 different materials (brain, nasal washings and serum) from the same patient.

Virus was obtained from either the clotted blood or the serum of 26 patients. All of the blood

ing a viral origin. The symptoms were usually those of a non-paralytic poliomyelitis or a mild 3- to 5-day fever accompanied by headache and often muscle pains. In one group of adults influenza was suspected. Because no influenza virus was isolated, the throat washings were tested for the Coxsackie strains with the results as shown in table 3.

The largest number of isolations has been from material of patients becoming ill during August and September, although specimens have been

positive from cases occurring throughout the year, especially in the spring Curnen, Shaw and Melnick (9) have reported likewise that the virus has been more often recovered from the August and September specimens

Differentiation into Serological Types Early in these studies it was observed that the antiserum from one strain of virus did not afford protection against several others. When more viruses were isolated, it became apparent that they belonged to serologically distinct types. The presence of a multiplicity of strains has been reported by both Dalldorf *et al* (3-5) and Melnick *et al* (10). Through the courtesy of Dr G Dalldorf of the Division of Laboratories and Research of the

but had certain properties in common 1) They could be propagated only in suckling mice or hamsters, did not infect 14- to 21-day old mice, embryonated eggs, young chicks, baby guinea pigs, rabbits or monkeys, including one 4 days old, 2) they all passed through a Seitz filter and 3) produced myositis but no neurological lesions in suckling mice. Virus could be found in the blood stream, the brain, cord, lungs, liver, spleen, kidneys and intestinal contents of infected mice and was present in high concentration in the skeletal muscles. Likewise the baby mice could be infected by various routes, intracerebrally, intraperitoneally, intramuscularly, subcutaneously and intranasally.

² Each number represents an individual case

New York State Department of Health, antisera were received for the viruses which he has designated as *types 1, 2 and 3 of group A*.

By means of both the neutralization and the complement-fixation tests (8), it was found that certain of the strains isolated in this laboratory fell into *types 1 and 2* but none so far into *type 3*. In addition 2 other immunologically distinct viruses have been found that are tentatively called *types 4 and 5*. Table 4 shows the geographical distribution according to states of the 86 strains that have been typed. So far, *type 4* has been found most frequently while *types 2 and 5* are next in prevalence. Although there was a tendency for a certain type to predominate in one area or in a particular outbreak, yet often one or more other types might be present also. *Type 5* seems to be prevalent in Florida and in Alabama.

All 4 of the strains were serologically distinct

ISOLATION OF TYPE 4 VIRUS FROM NORMAL MICE

Early in this study a question arose as to whether or not one or more of the Coxsackie strains might not be latent in normal mice. In May 1949, the filtered muscles of 4 normal 3-day old mice were inoculated into a group of 5-day old mice. In 4 days the animals became paralyzed and a second passage of filtered muscles to normal suckling mice resulted in establishment of a virus that was serologically different from the other 2 strains on hand and was later called *type 4*.

On reviewing the records, it was noticed that 2 Coxsackie strains that were later proven to be *type 4* were inoculated on the same day as the no. 1 normal mouse strain and it also happened that at least 7 strains of virus that later proved to be *type 4* had been isolated in the laboratory from human material during the preceding 2 months. This was unknown at that time.

The question now arose as to the origin of this *type 4* strain. Was it a latent mouse virus inactivated by inoculation or was it originally of human origin but so easily passed in the laboratory that it could be picked up in normal mice on serial passage?

From the facts that antibodies for *type 4* strain were found in human sera, that this virus could be obtained more than once from the same human tissues and could be found in mouth washings at weekly intervals, it seemed probable that the *type 4* strain might have a human origin but could be acquired by mice in the laboratory. Although no virus was recovered from the tissues of 3 pools of suckling mice tested at that time, yet from later experiments it seems highly prob-

able that accidental infection can occur in the laboratory. The same *type 4* virus has been isolated on 2 other occasions from the filtered muscles of normal mice that had been inoculated with filtered muscles of other normal mice.

ANALYSIS OF VIRUS ISOLATIONS

Because of the above findings and because so many viruses were being obtained, the isolations were analyzed according to the number of trans-

FIG 1 PASSAGES IN MICE before muscle paralysis occurred

fers in mice to recover 5 (3.9%) of the strains. In each instance such symptoms as lack of growth, slight muscle weakness and ataxia were observed in the mice that warranted the transfer of the muscle filtrates to more animals.

Besides these 126 isolations of the Coxsackie viruses, 200 other human specimens were inoculated into baby mice without recovery of a virus. One hundred and forty-six of the specimens were passed only once, while 44 were passed twice in mice, and 10 were given 3 passages without virus isolation. Therefore, out of 326 attempted isolations, 126 (38.6%) were positive for the Coxsackie viruses. It seems probable that some of these recoveries were not obtained from the human cases, but resulted from accidental transfer in the laboratory. The authentic strains are most likely those that show definite muscle paralysis on the first passage, although many obtained after 2 mouse transfers may also be considered.

SEROLOGICAL TESTS

Both neutralization and complement-fixation tests have been done on groups of human sera,

TABLE 5 RESULTS OF NEUTRALIZATION TESTS AGAINST COXSACKIE VIRUSES

Sera positive to a heterologous virus	4

fers made in suckling mice before typical muscle paralysis was observed. Figure 1 shows the number of isolations of each virus type obtained after 1, 2, 3 or 4 passages, respectively, in suckling mice. Of 126 isolations, only 28 (22.2%) viruses gave typical symptoms in mice after the first inoculations, 56 (44.4%) were definitely positive after a second transfer, 37 (29.2%) strains were obtained after a third passage, while it took 4

many of them taken during the acute and convalescent stages (8). As shown in table 5, of 55 paired sera only 15 (27.2%) showed evidence of a rise in neutralizing antibodies between the early and late specimens. Twenty-six (27.1%) of 95 sera tested neutralized more than one virus, although not all the specimens were tried against each of the 5 strains. The sera of 26 (72.2%) out of 36 patients from whom a virus was iso-

lated contained antibodies for the homologous type of Coxsackie virus, while 6 sera failed to be neutralized by the homologous strain and 4 were positive to a different type

The results of the neutralization tests against each of the 4 strains of virus are given also in table 5. Of 17 normal sera tested against types 2 and 4, only 4 were negative against the viruses employed

DISCUSSION

Although 126 isolations of the Coxsackie viruses have been made from tissues or secretions of 105 individuals, yet from the fact that the most prevalent type (type 4) has been recovered from filtered muscles of normal suckling mice, it seems quite likely that many of these isolations were due to dissemination of the virus in the laboratory. This is to be considered particularly probable, because on several occasions 2 different types of Coxsackie virus were obtained either from the same or from different specimens from one individual. These irregular findings have occurred at least 4 times.

In this study it has been of special interest to have recovered the Coxsackie viruses (types 2, 4 and 5) from the tissues or secretions of 12 different fatal cases, 6 of which were diagnosed as poliomyelitis. Poliomyelitis virus was isolated from the spinal cord of one of these patients and also from the feces of 2 recovered cases. Because of the lack of uniform symptoms, however, it is still a matter of conjecture whether or not the Coxsackie viruses were responsible for the fatalities.

The isolation of the Coxsackie viruses from the blood stream of human cases is likewise of significance, not only because it suggests a simple method of recovering virus, but also because the blood is thus a potential source of virus for blood sucking vectors. Melnick *et al* (10) have reported previously on the recovery of the Coxsackie virus from flies taken in nature. However, because of the frequency of isolating the virus from the oral passages, the evidence at present seems to indicate a person-to-person transmission.

Certain strains of the Coxsackie viruses seem to predominate in particular outbreaks and in certain areas. Where the infection seems to be mixed, the possibility of accidental contamination is to be considered. If one adheres to the following criteria, however, one should be reasonably

certain that the virus has come from the patient, 1) typical muscle paralysis in the first mice inoculated with the original specimen, 2) ability to recover the same strain of virus more than once from the same material and 3) presence of antibodies in the patient's serum to the same strain of virus isolated from the patient, preferably with evidence of a rise in titer.

SUMMARY

Strains of the Coxsackie group of viruses have been isolated from the tissues or secretions of 105 patients from 10 different states with multiple isolations from different kinds of specimens from 6 separate individuals. The widespread prevalence of this group of viruses is thus made apparent. Four distinct serological types have been obtained. Two of them correspond to types 1 and 2 of Dalldorf, the other 2, tentatively called types 4 and 5, are antigenically different, although giving the same clinical and pathological pictures in mice. These viruses have been recovered from human blood, serum, brain, cord, mouth or nasopharyngeal washings, saliva, sputum, nasal swabs, mouth vesicles, and feces, with a predominance of types 4, 2 and 5, in order of frequency. The viruses have been found in material from 12 fatal cases from 7 different states and have been recovered many times from the blood stream.

Neutralizing antibodies for the Coxsackie viruses have been found in the sera of both patients and normal individuals. Of 55 paired sera 15 (27.2%) showed an increase in antibody content between the acute and convalescent specimens, while 26 sera neutralized more than one type of virus. Antibodies for the homologous strain of virus were found in 26 (72.2%) of 36 sera of patients from whom a virus had been isolated. One of the strains of Coxsackie virus has been recovered 3 times from muscle filtrates of normal suckling mice inoculated with other normal mouse muscles and there is strong evidence to show that these viruses may spread accidentally in the laboratory, thus accounting for some of the isolations. To be assured that a particular virus has etiological significance, it should 1) produce typical muscle paralysis in suckling mice on the first inoculation, 2) should be recovered a second time from the same material and 3) should be neutralized by the patient's serum.

DIVERSE MANIFESTATIONS OF INFECTION WITH A STRAIN OF COXSACKIE VIRUS

EDWIN D KILBOURNE

From the Hospital of The Rockefeller Institute for Medical Research

NEW YORK CITY

SINCE THE ORIGINAL ISOLATION by Dalldorf and Sickles (1) of new viruses pathogenic for suckling mice, the properties of the Coxsackie viruses have been extensively investigated. However, studies of the disease produced with these viruses in man have been few, and largely limited to consideration of patients suspected of poliomyelitis. It is already evident that infection of the human with Coxsackie viruses may result in paralytic disease (2), aseptic meningitis (3), epidemic pleurodynia (4) or undifferentiated fever (4). The present report is concerned with a comprehensive study of the varied manifestations of infection with a strain of Coxsackie virus in a small, circumscribed outbreak unassociated with paralysis or meningitis.

In early August 1948, 5 of 6 physicians resident at the Hospital of The Rockefeller Institute and 2 non-resident physicians closely associated with the Hospital fell victim within a 2-day period to an acute febrile illness. Sporadic instances of illness also occurred concomitantly in other members of The Rockefeller Institute staff unassociated with the Hospital. Efforts to demonstrate serologic evidence of infection with the viruses of influenza A, influenza B, and Newcastle disease were unsuccessful in the early study of this influenza-like epidemic. Infectious mononucleosis, suspected because of the presence of atypical lymphocytes in blood smears, was excluded by the absence of significant concentrations of sheep red blood cell agglutinins in convalescent sera of patients. Attempts to recover a virus from blood and throat washings by inoculation of chick embryos and 3-week old Swiss mice were fruitless.

The report, in 1949, by Melnick, Shaw and Curnen (3) of the isolation in suckling mice of a virus from aseptic meningitis patients in New England in the summer of 1948, prompted re-investigation of The Rockefeller Institute outbreak because of its temporal coincidence with the New England epidemic. Neutralization tests em-

ploying the Connecticut strain (Conn 5) of virus (kindly supplied by Dr J L Melnick) against the paired sera of 7 patients promptly defined the etiology of The Rockefeller Institute illnesses. Because these patients had presented no clinical evidences of paralysis or meningitis, as described in earlier reports of Coxsackie virus infection, it seemed of importance to review the comprehensive clinical and laboratory data assembled on the 5 hospitalized patients in order to aid in the delineation of this newly recognized disease.

CLINICAL MANIFESTATIONS

Within the same 12-hour period, 6 of the 7 patients studied experienced the onset of fever. In all but one patient insidious prodromata of insomnia, malaise and migratory aches of low intensity had occurred during the preceding 24 to 48 hours.

Certain features of the disease encountered in 3 or more of the 5 hospitalized patients are listed in table 1. The major complaint in all patients was pain of aching character, usually described as 'muscular'. Pain involved the neck, eyes, back, head, legs and shoulders with greatest frequency. Restlessness was also described by all patients, and occurred chiefly in the afebrile, prodromal period. It is notable that 4 patients complained of mild pharyngeal soreness, in 3 this symptom appeared 48 hours after onset of fever. Fever and muscle tenderness were physical signs common to all patients. In 4 patients fever lasted less than 24 hours. The fifth patient suffered a febrile relapse on the sixth day of illness unassociated with the presence of bacterial pathogens in blood or throat cultures.

Except for the non-specific common complaints of pain and fever, there was little clinical indication that the patients studied were victims of the same disease. The diverse clinical manifestations of infection are contrasted in table 2. It is apparent that such widely divergent clinical entities as infectious mononucleosis, acute appendicitis, sinusitis, pleurodynia and influenza

were simulated by Coxsackie virus infection. Despite the brevity and benignity of the symptoms, the intensity of the abdominal and 'sinus' pain encountered was sufficient to instigate surgical consultation, while the severity of the chest pain in *patient H A* suggested acute pleuritic or

Despite the promptness of defervescence, convalescence in all patients was protracted, symptoms of transient aches, lassitude, generalized weakness and easy fatigability persisting for 1 to 5 weeks. During the ensuing 22 months no sequelae of infection have become apparent.

LABORATORY DATA

Routine urine analyses were negative, and none of the common pathogens was isolated from throat or blood cultures. Hematologic findings of interest are summarized in table 3. Unequivocal leukopenia was evident in 2, and low normal total leukocyte counts were observed in 2 other patients. Relative lymphocytosis was a feature of differential leukocyte counts made during the acute illness and also one month later. Large, atypical, young lymphocytes with deeply basophilic cytoplasm and lobulated nuclei were noted in 2 acute phase smears, and in the 4 convalescent phase smears studied. Eosinophilia occurred in 2 patients in early illness.

	Cough				

pericardial disease, the latter belied by a normal electrocardiogram.

Physical signs of disease were few. Slight pharyngeal injection and posterior pharyngeal lymphoid hyperplasia were noted in 3 patients. Generalized lymphadenopathy was not detected, but tender submaxillary lymphadenopathy was found in patients with pharyngeal soreness, and in one patient a small, tender axillary node was discovered. Splenomegaly of slight degree was discerned in 2 patients, one of whom complained of tenderness of palpation in the right hypochondrium and suprapubic region. The latter complaint was not associated with urinary tract signs or symptoms. Neurological examination in all patients was negative although *patient H E* remarked transient paresthesia in the right axilla.

DIAGNOSTIC AND IMMUNOLOGIC STUDIES

Confronted with the problem of re-investigating, 14 months after its occurrence, an epidemic from which no etiologic agent had been recovered, the factor of geographical propinquity dictated the choice of the Conn 5 strain of Coxsackie virus for trial neutralization tests with patients' sera. Tests were performed in 1- to 2-day-old Rockefeller Institute white mice by the intraperitoneal injection of 0.03 cc of virus-serum mixtures containing 50 median effective doses (using death and paralysis as the end point) of virus in the form of saline suspensions of eviscerated suckling mouse carcasses. Preliminary tests in which 1:10 (final) dilutions of sera were used demonstrated no neutralizing antibody in any of

the 7 acute phase specimens, and complete protection by all convalescent sera

Attempts to recover virus from the throat washings and blood of patients resulted in the isolation, on 2 occasions, of virus from the throat washing of patient *H K*. This throat washing, taken in phosphate buffered saline (pH 7.2) had

5 strain, while complement fixation occurred in the presence of HK antiserum and the Conn 5 virus (This and complement-fixation reactions subsequently mentioned were generously performed by Dr Jordi Casals)

Titration of neutralizing antibody in serum specimens was effected by mixing serial 4-fold dilutions of serum previously heated at 56°C for 30 minutes with a constant quantity of virus (i.e. 50 median effective doses). This method of titration was chosen because it should provide accurate measurement of antibody concentration in sera with high neutralizing capacity. Studies by Horsfall of the precision of neutralizing antibody measurements with influenza A virus in the mouse (5, 6), and by Horsfall and Curnen of PVM neutralizing antibodies in the same species (7) have demonstrated with both viruses an identical linear relationship between the serum dilution end points and the quantity of virus employed. Morgan (8) has shown the same relationship using still another virus (WEE) in the mouse inoculated by either the intraperitoneal or

been stored in a sealed glass ampoule for 14 months in a CO₂ cabinet prior to intraperitoneal injection into a litter of one-day-old mice. Five days later, tremors, ataxia and generalized weakness were noted, and all mice were killed for passage. On second passage, a 20 per cent broth suspension of extremities and brain tissue, injected intracerebrally and intraperitoneally, initiated paralysis as early as the third day. Third passage by the intraperitoneal route alone resulted in death or paralysis by the 5th day of all 16 mice inoculated. This virus (HK) was neutralized by specific immune serum against the Conn

intracerebral route. In these systems the quantity of virus may be varied as much as 7-fold without causing a significant (i.e. 4-fold) change in the neutralization titer of a serum.

In table 4 the neutralizing antibody titers of the 5 hospitalized patients may be compared. In every instance antibody was undetectable in acute phase serum, but manifest in high titer in convalescence. In 2 instances (patients *E K* and *H A*) when serum was obtained less than 2 weeks after onset of illness, very high antibody concentrations were already evident. High concentrations of antibody were still present in the sera of

all patients nearly 2 years after infection. Serial antibody titrations in *patient E K*, using both the Conn 5 virus and the HK virus homologous to the epidemic, reaffirmed the antigenic similarity of the 2 strains, and provide an indication of the slow rate of decline of neutralizing antibody levels. Concomitant serial determinations of complement-fixing antibody are also recorded in table 4.

Studies of the sera of 2 laboratory workers heavily exposed to infected litters and tissue suspensions were made 4 and 7 months, respectively, after initial exposure. No neutralizing antibodies were manifest in the serum of the worker exposed for the longer period. However, serum drawn from the other worker 4 months after his original exposure to Conn 5 virus was found to contain neutralizing antibody not ini-

tially present. During the period of exposure this person had experienced no clinical illness.

This study of an outbreak of Coxsackie virus infection has adduced certain facts worthy of emphasis. Coxsackie viruses, currently identified with poliomyelitis-like illness, may produce disease with widely divergent manifestations unsuggestive of poliomyelitis. Convalescence may be slow, and abnormal differential leukocyte patterns may persist for 4 to 5 weeks. Neutralizing antibody response is prompt, maximum serum titers appearing 2 weeks or less after the onset of illness, and high titers persist at least 21 months. Inapparent infection may occur and lead to a specific antibody response. The stability of the virus is indicated by its repeated recovery from a throat washing stored at -70°C for 14 months.

DIFFERENTIATION OF IMMUNOLOGICAL TYPES AMONG THE COXSACKIE VIRUSES¹

JOSEPH L. MELNICK AND LISBETH M. KRAFT

From the Section of Preventive Medicine, Yale University School of Medicine

NEW HAVEN, CONNECTICUT

SOON AFTER THE DISCOVERY of the Coxsackie group of viruses, it was clear that they existed in multiple immunological types (1, 2). In fact, in view of the differences in tropisms for certain murine tissues which exist among the types (3, 4), it is not unlikely that different viruses may now be included in this group. For the present, however, viruses whose capacity to produce overt disease in experimental animals is limited to infant mice and hamsters are being placed in the Coxsackie family. It is recognized that in mice some types (*group A*) produce a disease which seems to involve only the skeletal muscles, whereas other types (*group B*) also involve additional tissues, notably the brain. In any case, we shall deal here with methods for classifying strains of what are now considered to be the Coxsackie viruses into distinct immunological types.

The classical methods of immunology have been employed with certain modifications which have had to be adapted to these viruses and their infant hosts. The methods include 1) cross protection tests in infant mice born of vaccinated mothers, 2) production of pharyngeal and intestinal carriers of virus in chimpanzees following its oral administration, and a study of homologous and heterologous immunity in these animals, 3) cross neutralization tests, and 4) cross complement-fixation tests.

CROSS PROTECTION TESTS IN INFANT MICE

The susceptibility of mice to Coxsackie viruses is short-lived, and in a matter of a few days after birth they become naturally resistant to the disease. Consequently, cross protection tests in which challenge virus is inoculated into vaccinated mice cannot be performed, because the time required for an expected immunity to develop would place the mice out of their susceptible period. But by challenging infant mice

within 48 hours of birth from mothers vaccinated with different strains of active virus, we have been able to use this procedure as a typing method. The vaccinated females which were bred had neutralizing antibody titers of about 1:1000 against 100 ID₅₀ of virus and complement-fixing titers of about 1:64 against 8 units of antigen. It was found that homologous immunity was present whether or not the baby mice were nursed by their own or by foster mothers following the

— indicates mice susceptible to challenge inoculation

challenge inoculation of 100 ID₅₀ doses of virus. However, in practically all instances the infant mice received at least one feeding of colostrum from their own mother before the inoculation of virus. The results are shown in table 1.

The immunity was type specific and was completely absent when mice were challenged with heterotypic viruses. Strains which fall into the same antigenic type by other tests (neutralization and complement fixation) also fall into the same type in these cross protection tests. Thus mice

¹ Aided by a grant from the National Foundation for Infantile Paralysis, Inc.

vaccinated with the High Point or Texas-1 strain had babies immune to each of these strains and to the related NH Fly 1943 strain. Also when 2 strains (*JLM*, *NL*) related to Conn 5 were used for challenge, only mice from Conn-vaccinated mothers were protected. And when 2 strains (Easton-2 and NY-5) related to Dalldorf's type 1 were used, none of the offspring from mothers vaccinated with any of the 4 strains was protected.

HOMOLOGOUS AND HETEROLOGOUS IMMUNITY IN CHIMPANZEES

In following the immune response in chimpanzees which have no obvious signs of illness follow-

few days after the exposure and continuing for 3 to 6 days. Some, if not the bulk, of the virus fed is excreted within 3 to 5 days, and this is followed by new virus, 'manufactured' by the animal, for a period of 2 to 4 weeks. Antibodies to the virus appear within 2 weeks and maintain their titer for many months.

Several weeks later, if the same strain is re fed to such a chimpanzee, then the virus may be found in the stools for a period of about 5 days, having passively traveled through the alimentary tract. No true carrier state occurs, and it has not been possible to isolate virus from the blood or throat. However, if the Texas (heterotypic)

Fig 1 DEMONSTRATION OF HOMOTYPIC IMMUNITY and heterotypic susceptibility in the chimpanzee

ing oral infection with Coxsackie virus, criteria other than clinical illness must be used. The measure of infection is based on the development of a pharyngeal and intestinal carrier state (with viremia) and the accompanying appearance of neutralizing antibodies in the serum. The measure of immunity is based on whether or not the carrier state can be again produced by a challenge dose of virus. Similar studies in chimpanzees infected with poliomyelitis virus have recently been reported (5, 6).

The pattern of the results obtained (7) is shown in figure 1. If the Conn-5 strain is fed to a chimpanzee, the virus will appear in the blood for a few days following the feeding. Virus may be recovered from the throat generally starting a

strain of virus is now fed, then the chimpanzee appears to respond in the same manner as it did when the Conn virus was first fed, and a new antibody (Texas type) appears in the blood. Such a chimpanzee is now immune to both types, but may still respond like a new animal when fed a third type (Ohio).

With this method we have found that the Conn-5, Texas-1 and Ohio-1 strains each belong to a distinct immunological type and that the High Point strain is related to the Texas type.

CROSS NEUTRALIZATION TESTS

Type-specific neutralizing antibody is one of the most widely used reagents for identifying a virus, and for the Coxsackie group of viruses the

neutralization test works admirably if adequate numbers of infant mice are available for the performance of the tests. For diagnostic purposes, using paired sera, or for other quantitative antibody measurements, results are most satisfactory when a fixed quantity of virus is used with varying dilutions of serum. For typing of strains, however, we prefer to use a constant amount of serum (usually undilute or 1:5 mouse or monkey immune serum) and determine the titer of the strain in the presence of this serum. In conformity with the procedure used for other viruses, the neutralization index is the difference between the titer of the virus in the presence of the immune serum and that in the presence of normal serum. Pre-heating of the serum at 56° C for 30 minutes

in New Haven, Connecticut and Winston-Salem, North Carolina, and in the same year from sewage collected in Hartford, Connecticut. Antibodies to this type are also widespread, occurring in human sera collected on both the east and west coasts of the United States as well as in Denmark and Sweden. That the detection of these antibodies reflect prior infection with specific types of virus is suggested by the presence of Texas type antibodies and the absence of Conn type antibodies in the sera of over 50 individuals, both young and old, living in northern Alaska (7).

Further information on the specificity of the neutralizing antibody response has been obtained from an extensive study of the occurrence and development of antibodies in 6 patients who

TABLE 2 CROSS NEUTRALIZATION OF STRAINS OF COXSACKIE VIRUS

has no measurable effect on the content of antibodies.

The results of table 2 indicate that we can now recognize at least 7 antigenic types (7). Of these, 2—Conn -5 and Ohio—belong to *group B* and 5, to *group A*. It is noteworthy that strains belonging to one type may be widespread in their occurrence. For example, the *group A* Texas type, named from the fact that it was first isolated from flies trapped in Texas in 1948, has been recovered a) from human stools collected that year and the next in Texas, b) from sewage collected in North Carolina in 1948, and c) from flies collected in New Haven in 1943 and stored on dry ice until 1950. Furthermore, antibodies to this type are widespread in the human population, occurring in sera collected in several areas in this country, in Europe and in northern Alaska. *Group B* types may also be widespread, as evidenced by the isolation of the Conn -5 type in 1948 from patients

contracted infections with one or another of the Coxsackie viruses while working with them in the laboratory (7-9). From each patient a virus was isolated during the acute phase of illness which was typed by following the reactions with specific hyperimmune animal sera (see bottom three rows of table 3). The data in table 3 also show that no patient before his illness had detectable antibodies to the strain subsequently isolated from him or to the prototype strain. But soon after illness, there developed simultaneously antibodies to the strain isolated from the patient and to the prototype strain to which it was related.

The reactions of the sera of the laboratory patients with strains not related to the one isolated from each patient are instructive. Only 2 of the 6 patients had an illness due to Texas type infection, yet the other 4 must have had a subclinical infection with this type. The results with the serial samples of blood taken from patient

JLM starting several months before his illness emphasize this point on November 29, 1948, antibodies were absent to both the Conn and Texas types By February 21, 1949, antibodies to the Texas type had appeared in titer of 1 100

and this serum level was maintained in the next 4 bleedings carried out in May, June and October of that year The patient became ill (diagnosis compatible with epidemic pleurodynia or myalgia) on May 16, 1949, at a time when he had no antibodies to his own strain or to the Conn

ing 4 persons did not develop Ohio-type antibodies during the period studied, whereas a fourth, *LMK*, did at the time of illness The *LMK* strain proved to belong to the Ohio type

It is noteworthy that this experience serves as an accidental but nevertheless clear example that

strains belonging to the Conn -5, Ohio, and Texas types are capable of producing disease in man

At the time of *JLM*'s infection with the Conn type, his family was infected with yet another type. His daughter, Nancy aged 8, was ill with 2 bouts of fever (maximum 103.5°), the first from May 14 to 16 and the second from May 27 to 28

² *JLM* had fever from 5/18 to 5/23

³ *Nancy* had fever from 5/14 to 5/16 and recurrence on 5/27 to 28

Virus was isolated from fecal samples collected May 21 and June 5. Her strain belonged to a hitherto unknown type (7), shown by the data in table 4. *Nancy*'s mother, *SM*, was a healthy carrier of this strain as evidenced by isolation of the virus from her stools collected on June 10. However, unlike *Nancy*, she did not develop neutralizing antibodies to her own virus, nor to the Conn type which was the causative agent of

her husband's illness. *Nancy* developed antibodies to her own virus, to her mother's virus, but not to her father's virus. Between May 18 and 26, her father developed antibodies not only to his virus and to the Conn type to which it was related, but also to the type which infected the other 2 members of the family. The only reason for interpreting his illness as due to the Conn type and not to *Nancy*'s type was the isolation of a Conn type virus during his illness.

COMPLEMENT-FIXATION TESTS

In determining the cross reactions between strains by the complement-fixation test, the plate method of Fulton and Dumbell (10) has been employed whereby complement and serum are varied with a constant amount of antigen. Table 5

TABLE 5 CROSS REACTIONS OF COXSACKIE VIRUSES BY COMPLEMENT FIXATION

SERA	ANTIGENS						
	Texas 1	Hi Pt.	Conn 5	Ohio-1	D-1	D-2	D-3

Dalldorf 2	0	0	0	0	0	100	0
Dalldorf 3	0	0	0	0	0	0	100

shows the extent of the cross reactions between 7 strains of Coxsackie virus. The means for arriving at these figures are similar to those described for influenza virus (10) and will be described in detail for Coxsackie virus, but for the present it will suffice to say that '100' indicates a complete cross and '0' no crossing whatever. It is evident that the only extensive cross reaction occurs between strains High Point and Texas which together form a type immunologically distinct from the other 5 strains listed which in turn fall into 5 distinct types.

In preparing complement-fixing antigens for use with sera from heterologous animal species, antigens have been rendered specific for Coxsackie virus by treatment with protamine sulfate according to the method of Warren (11, 12). Table 6 shows the results of protamine treatment of mouse muscle antigen tested against immune sera of monkeys inoculated with mouse tissue. It

is seen that the nonspecific reactions of immune as well as of normal sera obtained with crude antigens (untreated) are eliminated when protamine treatment is employed

We have occasionally failed to make satisfactory antigens for the low-titer types (Ohio, Conn, Dalldorf's type 1) and have resorted to concentration by ultracentrifugation (7, 12). Numerous tests have been performed supporting the logic of this procedure, and table 7 indicates

The development of humoral complement-fixing antibodies in human infections with the Ohio type of Coxsackie virus has been studied (7, 12). Table 8 indicates the serum titers obtained at various times after onset of illness in 6 patients. Concentrated antigen was employed in the tests, which were carried out in tubes using the 50 per

* All but one of these sera were obtained through the courtesy of Drs Albert B Sabin and Alex J Steigman who made their collections in Ohio in 1947 (13). Isolations of Coxsackie virus from the stools of 3 of their patients were made (12).

cent hemolytic endpoint. Patient LMK had a proved laboratory infection with the Ohio type, and the same type had been isolated from Red, Lan and Hux. In the case of Ric and Ris no isolations were attempted, but it would appear from the complement-fixation results that Ric was infected whereas Ris was not.

Texas-1	X	X	X	X
D-1	X	X		
D-2	X	X		
D-3	X	X		
Nancy	X			

X indicates that by the method employed, the type indicated has been proven different from each of the other types tested by that method. A blank space indicates not done.

The temporal pattern of complement-fixing antibody obtained with the Ohio type, however, is not necessarily the same as that experienced in infections with other types. Patients infected with the Easton, 1949, strain (belonging to Dalldorf type 1) seemed to develop such antibodies much earlier than those infected with the Ohio type.

SUMMARY

Immunological evidence has been presented that the Coxsackie group of viruses exists in multiple antigenic types. At least 7 types are

now recognized. The methods for identifying these types have been reviewed in this paper. They are those of classical immunology with some modification to fit the virus-host systems involved and include 1) cross neutralization tests, 2) cross complement-fixation tests, 3) cross pro-

tection tests in infant mice born of vaccinated mothers and 4) cross protection tests in chimpanzees with subclinical infections. It can be seen from table 9 that each method yields results in agreement with those obtained by each of the other methods employed.

Symposium on Nutritional Appraisal of Human Subjects
Chairman W H SEBRELL, JR

EVALUATION OF THE SYMPTOMS AND SIGNS OF
DEFICIENCY DISEASES¹

WILLIAM J DARBY

*From the Division of Nutrition, Departments of Biochemistry and Medicine, Vanderbilt
University School of Medicine*

NASHVILLE, TENNESSEE

NUTRITION WORKERS oftentimes, and with some justification, accuse physicians generally of disregarding nutritional factors in the development of disease and of failing to accept some nutrition investigators' conclusions of widespread deficiency diseases within the population. Clinicians might reverse this indictment and accuse nutrition workers of oftentimes ignoring well-established clinical facts and of sometimes exhibiting a surprising ignorance of some fundamental medical concepts.

It is the writer's belief that the physician's sometime lack of enthusiasm for properly established nutritional claims has been attributable in part to the disappointment experienced when at other times nutritional claims were enthusiastically adopted, tested and found unsound. Accordingly, physicians have become cautious and even skeptical of all claims made by nutritionists. Because of such experiences, some clinicians are likely to regard nutrition workers as enthusiastic propagandists lacking in a knowledge of clinical medicine. It well behooves us as nutrition workers, therefore, to appraise critically the bases upon which we make claims, statements, policy recommendations and so forth. Otherwise we lose the confidence of other physicians and become ineffective.

Several examples could be cited to illustrate the above type of error. One such was the confusion of ordinary conjunctival thickening and pingueculae with xerosis conjunctivae or Bitot's

spots. The claims were made (1) that these thickened areas in the conjunctivae were due to chronic vitamin A deficiency, that 99 per cent of a low income population exhibited this condition and therefore "had microscopic ocular lesions characteristic of avitaminosis A." In another study (2) it was stated that "according to the above criterion every subject carried unresolved degenerative changes resulting from vitamin A deficiency, most of them of a moderate to severe character."

The year following the appearance of these claims of a startlingly high incidence of avitaminosis A, an experienced ophthalmologist (3) pointed out that "The 'spots', or pingueculae, are subepithelial infiltrations, the epithelium over them being unaffected, a condition different from xerosis in which the changes are in the epithelium, and that such spots are not associated with low states of vitamin A, as proved by blood tests." Furthermore, this ophthalmologist pointed out that these states represent common presenile or senile alterations.

Grossly the Bitot spot is characteristically laterally placed, although they may be both laterally and medially. The lesion is greyish, dull, and has somewhat the appearance of meringue. This is in contrast to the more elevated, gelatinous appearance of pingueculae. Illustrations of a true Bitot's spot may be found in Berliner's monograph (4).

Epidemiologic investigations consisting of simultaneous dietary studies, measurement of vitamin A concentration in the blood plasma, and observations of the conjunctivae with the slit lamp were made in two separate areas in North

¹Presented in the Symposium on Nutritional Appraisal of Human Subjects, Atlantic City, April 20, 1950.

Carolina (5, 6) The samples comprised approximately 1000 persons each. In neither study was a correlation found between the severity or incidence of the conjunctival changes and the level of vitamin A in either the diet or plasma. In a well-designed therapeutic study which tested the effect of the daily administration to nurses of 50,000 IU of vitamin A over a period of up to 2 years, Robertson and Morgan (7) found that upon examination with the slit lamp "it was not possible to determine which nurses were receiving vitamin A and which were not and that in none of the subjects with conjunctival elevations at the beginning did therapy cause the elevations to disappear. Therefore one would conclude that the conjunctival thickening is not caused by a deficiency of vitamin A." A similar lack of influence of vitamin A on the appearance of the thickenings was noted by Borsook and Wiehl (8).

In studies designed to produce avitaminosis A in human subjects, neither of these conjunctival lesions has been observed. The most extensive experimental study of vitamin A deprivation in man is that of the Vitamin A Sub-Committee of the Medical Research Council (9). Despite the production by dietary restriction of lowered carotene and vitamin A levels in the plasma and of abnormalities of dark adaptation, it was found that the various biomicroscopic changes observable initially in both the deficient and control groups did not vary with vitamin A intake. No Bitot spots developed.

The abundant evidence which has accumulated justifies the conclusion that the conjunctival changes which are commonly observed in our population are not related to avitaminosis A nor do they serve as useful measures of nutriture. Bitot spots are very infrequently seen in the population of the United States. When present they may at times indicate avitaminosis A but frequently are not evidence of vitamin A deficiency unless associated with other significant findings (10). Extravagant claims (11) concerning widespread avitaminosis A based upon the prevalence of these lesions in the population should be discarded.

What is the status of the skin lesions which have been said to signify avitaminosis A? First, one must be certain of the definition of these lesions, for confusion exists as to their characteristics. The workers who are most familiar with these lesions are investigators with experience in the Orient, India or Africa. The descriptions of the lesions indicate that they are hyperkeratotic

papules occurring at the site of the hair follicles and initially, at least, over the extensor surfaces of the body. Because of the plugging of the sweat glands, the skin is excessively dry. The lesions are not to be confused with the congenital condition known as ichthyosis—a confusion which I have observed repeatedly to occur when enthusiastic but inexperienced persons undertake their first nutrition surveys. Sometimes pityriasis rubra pilaris offers a differential problem (12). Furthermore, these lesions have been confused with a less common condition known as Darier's disease.

A more frequent and serious confusion seems to be that of hyperkeratosis follicularis with the common abnormality of skin texture known to dermatologists as keratosis pilaris. This condition would seem to be that which is sometimes referred to in the literature as 'permanent goose flesh'. It is not infrequent in children under 12 to 13 years of age regardless of their nutriture. These lesions tend to be less noticeable during the summer months when there is increased moisture of the skin and most prominent during the cold winter months when the moisture of the skin is decreased. I have observed these lesions in children who have had well-rounded diets plus supplementary vitamin A for the first 8 years of their lives and who exhibited satisfactory levels of vitamin A in the blood. Krause and Pierce (13) found no significant difference in the blood levels of children with and without the condition. These lesions are commonly seen in the United States. They cannot be taken as evidence of avitaminosis A. As a matter of fact, in a too-little-known paper which reports on 207 cases of avitaminosis A observed at Peiping Union Medical College, Frazier and Hu (14) pointed out that "The cutaneous eruption was characteristic of vitamin A deficiency only after the patient had attained sexual maturity. Before the age of puberty the only common abnormality of the skin (due to avitaminosis A-WJD) was xerosis." These workers noted that of the 91 children under 15 years of age and diagnosed as having avitaminosis A, only 4 exhibited the keratotic lesions, and these 4 were all in the 14- to 15-year age group.

It appears, then, that lack of familiarity with the skin lesions of avitaminosis A has most likely led many workers in America erroneously to assign to this deficiency all of the 'nutmeg grater-like' skin lesions which they have observed. Most certainly, the frequency of occurrence of rough, dry skins with or without 'permanent goose flesh' cannot be used as the chief index of vitamin A nutriture. As a matter of fact, there is appearing

an increasing body of evidence relating skin lesions seemingly indistinguishable from the hyperkeratosis of which we have been speaking to a lack of other dietary essentials, especially the B vitamins, and even unsaturated fatty acids (15)

Recent studies show that clinically manifest avitaminosis A will be accompanied by serum levels of vitamin A of less than 50 IU per 100 cc and that the earliest physiologic manifestation of this deficiency is the change in dark adaptation (9, 16). In my opinion, the only manner in which one may arrive at reasonable estimates of the incidence of vitamin A deficiency within a population is by the combined application of the clinical, biochemical and physiologic study coupled with observations on the therapeutic response of subjects judged deficient by these tests. Dietary studies may give confirmatory information, but they will chiefly be of value in the description of the food habits.

The question of avitaminosis A has been considered in some detail to serve as an example of the sort of critical appraisal of clinical methods which is desirable at this time.

Similarly, experience with the sign of so-called 'corneal vascularization' observable with the slit lamp as evidence for riboflavin deficiency has proved valueless for assessing the nutritional level population groups in this country. Although corneal vascularization does occur in ariboflavinosis (17), the occurrence of prominent vessels at the limbus, or indeed even of actual corneal invasion, is not correlated with the estimated riboflavin intake in the diet nor with other signs suggestive of riboflavin deficiency (5, 6, 18). Further, these conditions are not amenable to long-continued therapy with large quantities of riboflavin (8). Lastly, it may be added that vascularization of the cornea occurs in all types of corneal injury, and, at least in experimental animals, it may result from a great variety of dietary deficiencies (19-22).

It is to be concluded that this sign alone gives us no information as to the prevalence of ariboflavinosis within a population. In individual cases, however, it is reasonable to employ this sign as one of the several manifestations included in the syndrome of ariboflavinosis. This is to say that, as in all clinical diagnosis, we must not base our judgment upon the presence or absence of a single isolated non-specific sign.

Sebrell and Butler (23) demonstrated that fissuring at the angles of the mouth occurs in ariboflavinosis. This sign also occurs in deficiencies

of iron (24, 25), niacin (26, 27) and vitamin A. It is often produced by illfitting dentures (28), in which instance it is termed 'pseudoariboflavinosis'. It may occur in chronic illnesses, especially arthritis, and not respond to vigorous nutritional therapy. Angular fissures are frequently observed to appear during periods of treatment with certain antibiotics. At times we have observed cases in which the lesions seem to be allergic in origin. Responses of angular fissures to pantothenic acid (29) as well as pyridoxin (30, 31) have been reported. It is apparent that interpretation of the significance of this sign must be made with considerable knowledge of the individual patient, and that a mere tabulation of the frequency with which it occurs in a population does not provide a reliable index of ariboflavinosis within that population.

The biomicroscopic appearance of the lingual papillae has been recommended (32) and used in some studies as an indicator of the niacin nutriture. The non-specificity of lingual changes is apparent from the variety of conditions which may result in glossitis. For example, Glossitis may be associated with iron deficiency anemia and respond to therapy with iron alone (24, 25). It is a frequently observed sign in sprue and responds to folic acid (33). The glossitis of pernicious anemia, a disease characteristic of the older age group, responds more satisfactorily or permanently to vitamin B₁₂ than to folic acid (34). The deficiency glossitis of pellagra responds to niacin, but similar lesions may be amenable to therapy with riboflavin (17). Pantothenic acid (29) has been reported as efficacious in some instances.

Perhaps no other area of the body is subject to so great trauma as the mouth and tongue. The wearing of plates and the chewing of tobacco are frequent causes of glossitis and cheilosis (35). Post-menopausal atrophy of mucous membranes may be resistant to all forms of nutritional therapy. A legion of other non-nutritional lingual changes can be found in any good textbook of dermatology or of oral diagnosis. Among those most frequently referred to us for evaluation have been Moeller's glossitis, leucoplakia and lichen planus.

From the great variety of conditions which affect the lingual mucosa, only a few of which I have indicated here, it is apparent that biomicroscopic study of the condition of the tongue cannot serve to assess the niacin nutriture of a patient or a population.

It is well known that swollen, red, friable,

bleeding gums are characteristic of scurvy. It has been proposed (36) that changes in the gingivae serve as an index of vitamin C deficiency. Such an interpretation of these lesions would seem to receive support from studies on chronic ascorbic acid deficiency in the monkey (37) and from the investigations of Linghorne and others (38) on RCAF personnel. These investigations demonstrated that the recurrence of previously corrected gingivitis was retarded somewhat by the daily dietary intake of 75 mg of ascorbic acid in comparison with subjects receiving 25 or 10 mg of ascorbic acid. Without attempting to discuss all of the implications of this particular study, suffice it to note that gingivitis recurred (although more slowly) despite large intakes of ascorbic acid. Obviously there are causative factors other than vitamin C deficiency. Hence, gingivitis alone is not a valid criterion of ascorbic acid deficiency within the population. The gums, like other oral structures, are subject to many varieties of trauma and numerous gingival diseases are recognized by dentists and other oral diagnosticians. It is regretted that the guidance of those professionally trained persons with the best backgrounds in oral pathology has seldom been sought by nutrition investigators.

To summarize to this point: 1) biomicroscopic examination is of very limited value in assessing nutritional level of individuals. It would seem to be useless in nutrition surveys as a generally applied procedure. Its usefulness is limited to the study either of individual cases of suspected ariboflavinosis or to observations of tissue changes which occur in controlled experimental investigations such as that of the Vitamin C Sub-Committee (39). 2) A corollary of this conclusion is that estimates of the prevalence of nutritional deficiencies based upon this method should be discounted. 3) Clinical signs of nutritional deficiency are not specific and for them to have usefulness in the detection of nutritional deficiencies within the population, they must be interpreted in relation to the medical (and dietary) history, other physical findings, laboratory studies, and the results of therapeutic tests. 4) The nutrition investigator must recognize the limitations of his own training and background in clinical medicine, dentistry, ophthalmology and allied fields and work with competent individuals who are trained in these disciplines. Only by so doing will he make the greatest contribution to our total knowledge and avoid repetition of some of the expensive mistakes of the past.

Some of the signs widely used to 'judge nutri-

tional status' appear to have been incorporated into surveys without clearly defined rationale. For example, it has repeatedly been suggested that alterations in the texture, pigment or amount of hair, particularly in children, may be due to malnutrition, and these qualitative alterations have been listed in tables of clinical findings useful in the evaluation of nutritional status (40, 41). Hair changes are indeed oftentimes noted in malnourished children (42, 43). By analogy to experience with animals, unkempt hair might be considered as a manifestation of illness due to deficiency disease. However, such changes in the human have not been linked with any specific nutrient, and from the analogy with animals, one might predict that if alterations in hair texture and color be indeed evidences of malnutrition they could arise from a great variety of deficiencies. Momentary reflection upon the problem indicates that numerous non-nutritional factors related to the hygiene of the scalp and hair influence hair texture.

The significance of some additional skin changes deserves mention. Keratotic lesions have been discussed. In Kwashiorkor a 'crazy pavement' dermatosis occurs (44). It would not be surprising if some uninitiated enthusiastic worker reports a series of patients with congenital ichthyosis as having 'subclinical Kwashiorkor'. Another skin lesion of some interest is petechiae. These small, usually perifollicular 'spots' are seen in early scurvy, where they are usually distributed over the dependent portions of the body or, in infants, in areas of trauma. Petechiae resulting from other causes, however, have similar distributions. For example, patients with idiopathic or orthostatic purpura exhibit petechiae of similar distribution to those seen in early adult scurvy despite high ascorbic acid levels in the serum. They do not respond to massive therapy with vitamin C or numerous other therapeutic agents, nutritional and non-nutritional. Petechiae are seen in toxic manifestations, allergic states and in blood dyscrasias. In some of the latter, they may be associated with gingivitis to present a more confusing diagnostic problem. Petechiae also occur in a number of infectious diseases and may be seen in limited numbers in older persons with senile atrophy of the skin. Obviously, evaluation of this sign must be made in relation to other findings.

The skin lesions of pellagra are usually symmetrically distributed over the exposed surfaces. The reason for this is that the pellagra is photosensitive (45) and the skin changes are a mani-

festation of this. It is apparent, therefore, that very similar lesions will be produced in other photosensitive states, such as lupus erythematosus, in extensive vitiligo following exposure to the sun, ordinary sunburn, and so on.

So-called 'seborrheic dermatitis,' particularly of the face, nasolabial angle, and ears may result from a deficiency of riboflavin or niacin. However, indistinguishable lesions occur not infrequently in absence of deficiency states.

Neurologic manifestations of deficiency diseases include changes in the tendon reflexes and impairment of vibratory sense, both of which may result from peripheral neuritis. Peripheral neuritis may be a manifestation of thiamine deficiency, due to pernicious anemia, or have other etiologies. Under well-controlled conditions, repeated observations of these changes may provide some useful information regarding the development of deficiency diseases (46), especially if these observations be coupled with therapeutic testing. However, the multiplicity of factors affecting these two signs, together with the alterations which occur with advancing age, and the failure of the response to thiamine of the commonly occurring neurologic 'abnormalities' (47) demonstrate the restricted value of such observations for the determination of thiamine nutriture within a population.

I would be the last to deny that physical signs are an essential part of nutrition surveys when the observed signs are placed in proper relationship to known medical conditions which may result in these signs, along with well-conceived laboratory studies and dietary and therapeutic investigations. However, without such sound medical appraisal of the meaning of these signs, one should not make claims of the existence of widespread deficiency states based upon the physical findings alone.

Another word of caution concerning the evaluation and comparability of physical signs is necessary. This has to do with the subjectivity inherent in the clinical examination in nutrition—a problem well discussed by Bean (48) who noted that considerable differences may occur in the frequency with which examiners record the presence of a given physical finding within a population group. The interpretation or manner in which an examiner sees a condition or lesion depends, as Bean noted, very much upon the physician's own conditioning. For example, in

studying cheilosis the clinicians who reported a very low incidence were familiar with the angular stomatitis or cheilosis which was frequently seen in severely malnourished individuals. They failed to record abnormalities of the lips which were noted by other observers.

In this relation, the following table from data from a study in which I have been interested is pertinent. Observers, whose initial appraisals were all made under one experienced worker, recorded their clinical judgment as to general nutritional status of portions of a population. The ratings were undernourished, adequately nourished and obese. The table presents the percentage judged to be undernourished or obese by a given observer. Great variation is seen in the judgments of these clinicians. Accordingly, we listed these data in approximately the order of

TABLE 1 PHYSICAL FINDINGS BY EXAMINER
EXPRESSED AS PERCENTAGE OF TOTAL
EXAMINATIONS BY THE EXAMINER

EXAMINER	GENERAL NUTRITURE	
	Under	Obese
<i>R C</i>	26.9	9.5
<i>K S</i>	24.3	12.6
<i>E W</i>	11.4	19.8
<i>C W</i>	8.4	16.9
<i>W Mc</i>	14.7	27.2
<i>R P</i>	3.1	13.8

the weight of the examiner. It is apparent that the clinician's concept of normal bore a relationship to his own weight, that is, the heavier physician was inclined to judge fewer people overweight and more people underweight than did the thinner physicians.

Obviously, there is a large and oftentimes immeasurable subjective influence in appraisals of physical signs. This must not be forgotten when one attempts to compare the frequency of occurrence of given lesions in one study with those reported for another. It would be of interest to have data which would test the constancy of the judgment of a single investigator over a period of years. I would predict that changes in the criteria employed by a given observer would be found.

The author is indebted to The Rockefeller Foundation, The Nutrition Foundation and The National Vitamin Foundation for support of clinical studies and nutrition surveys upon the experience of which much of the present report is based.

EVALUATION OF DIETARY SURVEY METHODS¹

L A MAYNARD

From Cornell University

ITHACA, NEW YORK

THE ADVANCEMENT of the cause of nutrition depends upon a better understanding of body needs and of how these needs can be met through an appropriate food intake. Dietary surveys serve both of these objectives in a variety of ways. They serve to chart food consumption patterns which can be studied in relation to economic and educational status, cultural backgrounds and food habits, available food supplies and other factors. They provide the basis for more effective programs of nutrition education and for evaluating the results. On a national or regional basis, they furnish needed information for planning food production programs.

With respect to the topic of this symposium, they serve in the appraisal of the state of nutrition of individuals, families and other groups, through a comparison of the data obtained with some standard or yardstick of adequacy. They do not measure nutritional status directly. Rather they provide presumptive evidence, as well as yielding data which can assist in the interpretation of the results of more direct measures. In the past some workers have used the data from dietary surveys to draw conclusions regarding nutritional status, and particularly the extent of malnutrition, far more broadly than the methods used and their bases warranted. On the other hand, others who are particularly impressed by the limitations of the methods have expressed the view that surveys can have little value in the appraisal of nutritional health. Neither extreme viewpoint is justifiable. Surveys can contribute greatly if they are properly conducted and the results interpreted with a full recognition of the limitations involved.

Dietary surveys take many different forms, both with respect to the methods of obtaining data on food and nutrient intake, and to procedures for evaluating their meaning with reference to nutritional status. The various procedures have recently been comprehensively and critically reviewed in a section of the report of the Com-

mittee on Nutrition Surveys of the Food and Nutrition Board (1). This report should be carefully read by anyone who is planning work in the field. The present talk deals with certain aspects which are particularly pertinent in the use of dietary surveys as an aid in appraising nutritional status.

Whatever method of obtaining food intakes is used, some yardstick of adequacy is required to evaluate them. The reliability of the yardstick is thus of basic importance. At the present time there are certainly different concepts as to what constitutes malnutrition and, thus, as to what is an appropriate standard. In this country, assuming that the foods are translated into nutrients, it has become customary to use the Recommended Dietary Allowances. A direct comparison is made where the intakes are expressed as nutrients. Otherwise, servings or other measures of the foods themselves are compared with a recommended dietary pattern based on the Allowances. It is important, therefore, to recognize that these Allowances are higher than average needs, "to cover substantially all individual variations in the requirements of normal people." Parenthetically, the question arises as to what the word, normal, means. Not all individuals who fail to meet the Allowances can be considered to be malnourished. Some have failed to recognize this point in interpreting intake data.

Here also lies a limitation of food or nutrient intake data as measures of individual nutritional status. One does not know whether a particular individual needs the full amounts specified or whether substantially lesser intakes of some of the nutrients would suffice. As an illustration, in a small sample in Canada, Pett found that nearly 50 per cent of the adults were in calcium balance on an intake which was only half the 1945 Recommended Allowance and thus only 40 per cent of the present one (2). It may be considered that those 'normal' individuals who fully meet the Allowances or more are adequately nourished. Certainly, also, there is a level below which inadequacy can be assumed. In between lies a

¹Presented in the Symposium on Nutritional Appraisal of Human Subjects, Atlantic City, April 20, 1950.

zone of uncertainty for the individual which further research may allow. The Allowances provide no data for several nutrients now known to be essential. It is possible that a diet may meet all the stated Allowances adequately yet fail to provide all the nutritional requirements for health. The Allowances are based to a large extent on the findings obtained in biochemical studies and in medical inspections for signs and symptoms of deficiencies, which have been previously discussed in this symposium. Thus, the reliability of these findings must be considered in using the Allowances as a yardstick. The previous discussions have indicated that these biochemical and medical measures are still subject to much uncertainty as regards their significance. All of these considerations should rule out generalizations regarding the incidence of malnutrition from dietary data alone, but they do indicate the value of such data for the support and interpretation of other measures.

It is clear that individual data are needed in any appraisal of the status of the individual. Repeatedly it has been shown that the food intake of the family may not be distributed among its members in proportion to individual needs. Whatever method is used for the individual, the goal must be the actual food intake. Waste must be accounted for. It is agreed that the most accurate method of arriving at the actual nutrient intake is a laboratory analysis of duplicate meals, together with an analysis of the food not eaten, if any. The time, expense and special techniques involved limit the use of this method to a comparatively few individuals. It is not practicable for use in dietary surveys in the broad sense.

Thus, the reliability of other methods of assessing individual nutrient intakes is a question of special importance. The most commonly used procedure is the calculation of the nutrients consumed by use of food tables giving average composition. The question of the applicability of these calculated values as a measure of the intakes of individuals in specific dietary situations is an important one. Several recent studies, such as those reported and reviewed by Kiser and associates (3), Bransby and associates (4), and others, have led many to conclude that calculated values are not sufficiently reliable to assess the adequacy of the diet of an individual. As is to be expected, variations are greater in the case of certain vitamins than for other nutrients. Obviously, tables giving average composition cannot accurately

reflect the actual nutrient intake from the food supply consumed in specific situations. Many factors cause the composition of staple foods to deviate from average values. Production, processing and storage variables are of particular importance for certain foods and in certain localities. Variable losses in home preparation must be expected, even though they are accounted for on an average basis.

These facts should cause us to consider how the influences of the variables in current tables of average composition can be minimized in future work, rather than arbitrarily to rule out calculated values for the individual. Advantage can frequently be taken of data for the composition of the local food supply at the season in question or of its nature as actually consumed, which may be more applicable than the average data. In a recent study by Hunter, *et al* (5), in Canada, in which the food composition data selected were those considered most likely to apply to the conditions in question, reasonably good agreement was obtained, with a few exceptions, between calculated and analyzed values. The revised tables of composition, now in the process of publication by the Bureau of Human Nutrition and Home Economics, will certainly provide data which are more applicable to the foods now used and to specific situations as well.

Comparative studies of calculated and analyzed values should be continued with a fuller recognition of the possibilities of lessening the discrepancies previously reported. Not all of the differences should be blamed on the limitations of the average data on composition. Analyzed values may be subject to errors in measuring the food actually consumed and also to errors in carrying out the analytical methods. Unless the food intake data themselves represent reasonably well what was actually eaten by the individual, nutrient calculations not only are not worthwhile, but also may lead to very erroneous conclusions. Records consisting of weights or measures of food eaten provide a more accurate basis than those expressed as servings.

The discussion thus far has dealt with procedures which give the greatest promise of reliability for appraising the nutritional status of the individual and for the support of and correlation with biochemical and physical findings obtained with the same subjects. Obviously it is impracticable to use them for any large segment of the population and for the broader purpose thus

served. The usefulness of family data for periodically assessing the food intakes, food habits and dietary trends of various segments of the population in relation to economic status, region, family size, food supplies available and other factors is well established. We are all aware of the large and important contributions which the Bureau of Human Nutrition and Home Economics are making along these lines.

With both family and individual food records the question as to whether or not the methods of collecting and evaluating the data can be shortened and still accomplish the purpose is of real importance in the interest of studying large groups. The calculation of nutrient intakes, food by food, is a very time-consuming process. The use of the so-called short method in which certain foods are grouped together greatly lessens the work involved. Several reports have indicated close agreement between certain short methods and the conventional long one. It has been shown, however, that short methods fall down where, in the diets under study, the foods making up a given group are consumed in quite a different proportion from that assumed in the grouping made. An intake of turnip greens as the sole representative of the green, leafy and yellow vegetable group should not be subjected to the same conversion factors as a weighed mixture of spinach, carrots, lettuce etc.

The recording of food intakes by servings is much simpler than by weight, and cooperation in obtaining records which can be considered reliable is more readily obtained on this basis. They are subject to more error, however, as a basis for calculating nutrient intakes. Anyone who has worked with data on food intakes recorded by the subject knows that large errors must have been made by some individuals in keeping the records, although the mean values may be representative of the group as a whole. The low individual records are of most concern, but one does not know to what extent they represent merely omissions from the record rather than dietary inadequacy. Diet histories are very useful as a supplementary measure and as a means of obtaining a general picture of dietary habits, but they hardly suffice in themselves to provide a quantitative picture of food and nutrient intake. Much depends on the skill and experience of the interviewer and the time with each individual. Diet histories can be taken so rapidly and poorly as to result in generally erroneous rather than useful information. Either in taking diet histories or in

tabulating food intake records, an increasingly used method is to score the diet for adequacy in terms of specific food groups, viz two servings daily of fruits and vegetables high in C, one or more servings of fruits and vegetables high in carotene, etc. This system may involve a minimum of error for a diet following the conventional pattern on which the scoring is based. Large errors are possible under other conditions, for there are many different food combinations which can provide an adequate diet.

Much has been written about the relative usefulness of one-, 3- and 7-day records. No generalizations seem worthwhile except to say that a one-day record unaccompanied by any other measure is likely to be meaningless for the individual. Even a week's record has limitations. Seasonal differences have a large influence on the current picture obtained, particularly in rural areas in certain parts of the country. Nutritional status is also a reflection of the previous as well as the current diet. As pointed out by Smith (6) in discussing his survey of maternal nutrition in Holland, "nutrition, good or bad, is the sum of highly variable quantitative and chronological factors. The results of any form of dietary inadequacy must vary in accordance with its extent in time."

The previous discussion is not intended to imply that the shorter methods of collecting and evaluating food data are not useful for various purposes. There are several published reports which show their value (7-9). The studies by Burke and associates showing the influence of nutrition during pregnancy on the condition of the infant at birth are an excellent example. The reports of the survey made under the direction of Harvard workers in New York State following the war, to determine general nutritional status and dietary trends, illustrate how various methods may be used to this end and critically discuss the limitations of each (10, 11). Irrespective of time and cost considerations, the use of more detailed methods has disadvantages in that it may limit the cooperating subjects to a non-representative sample and also result in poor cooperation in the actual recording of data. While contacts by the nutritionists with the subjects both before and during the study, in which its importance is explained, helps greatly in obtaining the desired cooperation, they also may stimulate the subjects to consume a better than usual diet.

Whatever method of arriving at food intakes is

employed, the use of appropriate sampling methods to obtain a representative picture of the population under study is basic. So also is the use of appropriate statistical methods in assessing the significance of the results. These requirements have frequently not been met.

In this talk the limitations of various dietary survey methods have been stressed because it seems important that they be borne in mind in interpreting the conclusions from published results. The discussion should indicate that there is a large background of knowledge and experience of which advantage can and should be taken in making future surveys more reliable and useful. Otherwise, a waste of effort and funds will result and erroneous conclusions will be added to the literature. The effective investigator will be the one who fully understands the advantages and limitations of the various procedures, chooses the one best suited to his specific objective and interprets his results accordingly.

There should be periodic group conferences of workers in the field, such as the U S D A "Conference on Study of Food Intake," held in October 1948, and the one held at the Children's Fund of Michigan last November dealing with the evaluation of methods of studying the relation of nutrition to maternal and infant health. Such conferences provide the opportunity for the critical comparison of procedures and data. They can also serve to promote joint activities to test the correspondence of the data obtained with a given procedure in the hands of different workers.

The results of their deliberations and joint activities should be published to enable others to take advantage of them. By making use of past experience and by critical group examination of current activities, dietary surveys can continue to contribute largely to the advancement of nutrition. Certainly, the methods have limitations but what other method concerned with nutritional status does not?

With respect to the general topic of this symposium, it is clear that dietary records should accompany the appraisal of nutritional status by more direct methods, where possible. Dietary data should help interpret the nutritional significance of the physical signs of deficiency, which are mostly non-specific. They should also aid in clarifying the meaning of various nutrient blood levels since some of them are directly related to current dietary intakes.

In the present situation there is a need for further coordinated studies in which the 3 measures are used with the same subjects, in the interest of evaluating the significance and usefulness of the data of each. Such studies should serve to establish more reliable criteria for evaluating nutritional status by each method. Such continuing research would promote what Dr. King, in a symposium on nutrition surveys in the Federation program 5 years ago, referred to as the most seriously needed study, namely, "to find, through long periods of time, the degree of correlation that exists between the health records of individuals and their dietary habits."

STANDARDIZATION OF DEFINITIONS AND SYMBOLS IN RESPIRATORY PHYSIOLOGY

ON APRIL 19, 1950, a group of physiologists met in Atlantic City to discuss the possibility of establishing a systematic set of symbols for use in teaching and research publications relating to respiratory physiology. The need for such a set of symbols is very great. During the last few years, a number of mathematical generalizations have been developed to describe respiratory processes and these generalizations now form the framework for research and instruction in respiratory physiology in medical schools, clinical laboratories and military establishments throughout the country. While there is general agreement

literature without sacrificing flexibility desired for development of new ideas and new equations. The following definitions and symbols represent the fruit of these discussions and they are presented here with the hope that authors and editors will use them as a reference source to achieve uniformity and clarity in terminology in the field of respiratory physiology.

SUBDIVISIONS OF THE LUNG VOLUME

The proposed definitions of lung volume are shown diagrammatically in figure 1. The primary subdivisions of the lung volume shown at right apply to all levels of respiratory effort and con-

FIG 1 SUBDIVISIONS OF THE LUNG VOLUME

All gas volumes corrected to body temperature, pressure and saturated with water vapor BTPS. Dimensions to be specified in each publication (e.g., liters, ml, cu in., etc.) See table 1 for comparison with the various terminologies now in the literature.

among physiologists concerning the important variables and equations, there has been no effort to reach agreement on definitions and symbols for textbooks or for research publications. Students trained with one set of symbols are bewildered by the multitude of different terminologies in the current literature. Even experts in the field find difficulty in deciphering the equations published by their colleagues from other laboratories.

The discussions at Atlantic City were concerned with two main problems: a) definition of lung volumes and b) recommendation of a set of symbols which would provide uniformity for the

tain no overlapping volumes. The 'capacity' terms at left each include two or more of the primary subdivisions and are specially convenient for clinical applications where gasometric measures are most simply made from the expiratory position of the resting patient.

Table 1 contains a comparison of the proposed definitions with various current terminologies. The references have been taken from eight widely used textbooks or handbooks and provide a sample of the diverse definitions now in the literature. It will be noted that use of the term 'air' to denote volume is avoided in the new terminology. The terms 'complemental air' and 'supplemental air'

are replaced by 'inspiratory reserve volume' and 'expiratory reserve volume' which have functional meanings and are therefore more easily

TABLE 1 SUBDIVISIONS OF THE LUNG VOLUME
COMPARISON OF PROPOSED TERMINOLOGY
WITH PREVIOUS TERMINOLOGIES

PROPOSED TERM	PREVIOUS TERMS WITH REFERENCES
I Inspiratory re-serve volume	Complemental air (3, 4, 7) Complementary air (5) Complemental air minus tidal air (1, 2) Inspiratory capacity minus tidal volume (6)
II Expiratory re-serve volume	Supplemental air (4, 7) Reserve air (1, 2, 3, 5, 7, 8)
III Tidal volume	Tidal air (All references except 6)
IV Residual volume	Residual air (1, 2, 4, 5, 7, 8) Residual capacity (6)
V Vital capacity	Vital capacity (All references)
VI Inspiratory capacity	Complemental air (1, 2) Complementary air (8)
VII Functional residual capacity	Functional residual air (1, 2, 7) Midcapacity (1, 4) Normal capacity (3)

remembered The old controversy as to whether 'complemental air' should include tidal 'air' has been avoided by introducing the term 'inspiratory capacity' to denote the sum of a resting tidal volume and the inspiratory reserve volume

A SET OF SYMBOLS FOR USE IN RESPIRATORY
PHYSIOLOGY

In designing a set of symbols for general use in respiratory physiology it was our aim to provide a systematic method requiring as few special definitions as possible The method of choice was to adopt single large capital letters to denote general respiratory variables such as pressure, volume concentration etc, and to modify each variable with one or more small type symbols denoting location, molecular species or special

TABLE 2 SYMBOLS FOR RESPIRATORY
PHYSIOLOGY

	SYMBOL	DEFINITION DIMENSIONS AND CONDITIONS MUST BE SPECIFIED IN EACH PUBLICATION
I General variables	V	Gas volume in general Pressure, temperature and percentage saturation with water vapor must be stated
	V	Gas volume per unit time
	P	Gas pressure in general
	F	Fractional concentration in dry gas phase
	Q	Volume flow of blood
	C	Concentration in blood phase
	f	Respiratory frequency—breaths per unit time
	R	Respiratory exchange ratio in general (volume CO ₂ /volume O ₂)
II Symbol for the gas phase (SMALL CAPS)	D	Diffusing capacity in general (volume per unit time per unit pressure difference)
	I	Inspired gas
	E	Expired gas
	A	Alveolar gas
	T	Tidal gas
	D	Dead space gas
	B	Barometric
III Symbol for the blood phase	b	Blood in general
	a	Arterial (exact location to be specified in each publication)
	v	Venous (exact location to be specified in each publication)
	c	Capillary (exact location to be specified in each publication)
IV Special symbols and abbreviations	\bar{X}	Dash above any symbol indicates a mean value
	X	Dot above any symbol indicates a time derivative
	s	Subscript to denote the steady state
	STPD	Standard temperature, pressure, dry (0°C, 760 mm Hg)
	BTPS	Body temperature, pressure, saturated with water
	ATPD	Ambient temperature, pressure, dry
	ATPS	Ambient temperature, pressure, saturated with water

TABLE 3 RESPIRATORY EQUATIONS EXAMPLES OF USE OF NEW TERMINOLOGY

- I Calculation of oxygen consumption or carbon dioxide production from analysis of volume and composition of expired gas while breathing any mixture of oxygen and carbon dioxide in nitrogen or other neutral gas

V_{O_2}

$$= V_E \frac{[F_{I_{O_2}}(1 - F_{E_{CO_2}}) - F_{E_{O_2}}(1 - F_{I_{CO_2}})]}{(1 - F_{I_{O_2}} - F_{I_{CO_2}})} \quad (1)$$

V_{CO_2}

$$= V_E \frac{[F_{E_{CO_2}}(1 - F_{I_{O_2}}) - F_{I_{CO_2}}(1 - F_{E_{O_2}})]}{(1 - F_{I_{O_2}} - F_{I_{CO_2}})} \quad (2)$$

where all volumes are corrected to STPD
The quotient of *equations 2 and 1* yields the respiratory exchange ratio for the expired gas

$$R_E = \frac{V_{CO_2}}{V_{O_2}} = \frac{[F_{E_{CO_2}}(1 - F_{I_{O_2}}) - F_{I_{CO_2}}(1 - F_{E_{O_2}})]}{[F_{I_{O_2}}(1 - F_{E_{CO_2}}) - F_{E_{O_2}}(1 - F_{I_{CO_2}})]} \quad (3)$$

For the special case where carbon dioxide may be considered negligible in the inspired gas, these equations reduce to simpler forms
If measurements are made in the steady state then $R_E = R_S =$ metabolic respiratory quotient

- II Calculation of the pressure of oxygen in alveolar gas while breathing any mixture of oxygen with neutral gas at any barometric pressure

$$P_{A_{O_2}} = F_{I_{O_2}}(P_B - P_{A_{H_2O}}) - P_{A_{CO_2}} \left[F_{I_{O_2}} + \frac{(1 - F_{I_{O_2}})}{R_A} \right]$$

This equation is of special importance in determining equivalent altitudes and oxygen specifications for aircraft. It is frequently called the 'alveolar' equation although it applies equally to any part of expired gas which has undergone respiratory exchange

TABLE 3—Continued

- III The relations between alveolar ventilation and metabolism

$$V_A = \frac{V_{CO_2}}{F_{A_{CO_2}}} = \frac{R_A}{F_{A_{CO_2}}} V_{O_2} = (P_B - P_{A_{H_2O}}) \frac{R_A}{P_{A_{CO_2}}} \dot{V}_{O_2}$$

where

$$V_A = (V_T - V_D)f$$

- IV The Bohr Equation for the respiratory dead space to any gas x

$$V_{D_x} = \frac{(F_{E_x} - F_{A_x})}{(F_{I_x} - F_{A_x})} V_T$$

where all volumes are corrected to BTPS

- V Fick's Principle becomes

$$V_{O_2} = Qb(Ca_{O_2} - C\bar{v}_{O_2})$$

- VI The ratio between alveolar ventilation and blood flow through the lungs (cardiac output) in the steady state

$$\frac{V_A}{\dot{Q}_b} = R_S(P_B - P_{A_{H_2O}}) \frac{(Ca_{O_2} - C\bar{v}_{O_2})}{P_{A_{CO_2}}}$$

- VII The diffusing capacity of the lungs to oxygen as calculated by the Bohr method

$$D_{L_{O_2}} = \frac{V_{O_2}}{P_{A_{O_2}} - \bar{P}_{C_{O_2}}}$$

where the mean oxygen pressure in capillary blood ($\bar{P}_{C_{O_2}}$) is calculated from graphical integration of the oxygen dissociation curve

conditions The following conventions were adopted for symbols denoting location and molecular species

- 1 Localization in the gas phase is represented by a small capital letter immediately following the principal variable. Thus pressure in *alveolar* gas is represented by P_A
- 2 Localization in the blood phase is represented by a lower case letter immediately following the principal variable. Thus pressure in the *arterial* blood is represented by P_a
- 3 Molecular species is denoted by the full chemical symbol to be printed in small capital letters immediately following the principal variable

Thus pressure of carbon dioxide is represented by P_{CO}

- 4 When specification of *both* location and molecular species is required then the first modifying letter will be used for localization and the second for species. Thus the pressure of carbon dioxide in alveolar gas is represented by PA_{CO_2} . In this case, the chemical symbol appears as a subscript.

The full list of symbols which were discussed and approved by the group at Atlantic City is shown in table 2. Some of the commonly used respiratory equations are represented in terms of the new symbols in table 3.

NOTES ON THE USE OF THE PROPOSED SYMBOLS

It is hoped that authors employing the proposed system of symbols will provide a list of definitions similar to those of table 2 as an integral part of each manuscript. We wish to emphasize that the symbols listed in table 2 are sufficient only to describe the principal *existing* respiratory equations, samples of which are illustrated in table 3. New symbols are easily added to the list without altering the method of symbolization. For example, it may be useful to consider separately that part of the total pulmonary blood flow which is effective in the exchange of gases. Suitable subscripts for this purpose (e.g. Q_{L_e} , to de-

note effective flow through lungs) should then be included in the list.

No special difficulties are anticipated in connection with printing of the proposed symbols. However, the proposed notation is not adapted to the typewriter. This is a disadvantage but, in our opinion, should not be a deciding factor in the choice of symbols. Several sets of symbols have been devised which were 'tailor-made' for the typewriter but none of them provide a logical system which is easy to learn and adaptable to future developments in the field.

The following have agreed to follow the above terminology and system of notation wherever possible in their future teaching and research publications:

"Although E.C. 110 (CAFERGONE) was developed primarily for the relief of the migraine attack, it is uniformly effective and has a much wider range of usefulness in the relief of headache of all other types, especially typical and atypical histaminic cephalgia" (Hansel)⁽¹⁾

For The First Time In Almost Two Thousand Years, clinical trials of an oral preparation indicate that migraine and other vascular headaches can be aborted in 85-90% of cases

Although the cause of migraine is still unknown, the mechanism productive of head pain has been determined⁽²⁾ Today, it has been observed that the head pain in classical migraine and related disorders is produced through abnormal behavior of the cranial vascular system. The affected arteries, principally branches of the external carotids, become constricted in the early stage of the attack. Such vasoconstriction results in pre-headache warning signs such as visual and other sensory disturbances. Later in the attack, these arteries become relaxed and dilated. *At this point, agonizing headache begins.* Exaggerated pulsations and thickening of the affected arterial walls cause stretching of and

BEST RESULTS WITH TREATMENT
IN STAGE 1 OR EARLY STAGE 2

pressure upon adjacent pain-sensitive structures. Headaches of this type may last for a few minutes only or they may last for days. Seizures are usually terminated by severe vomiting.

As a result of recent research, these headaches can be aborted for the great majority of sufferers. *Attention has been centered on the development of an effective oral preparation to relieve vascular headaches.* Cafergone (100 mg caffeine and 1 mg ergotamine tartrate per tablet) is the result of this research. Ergotamine tartrate (Gynergen) has long

been known as a potent vasoconstrictor^(3, 4) Caffeine, when administered orally, also acts as a vasoconstrictor⁽⁵⁾ Simultaneous administration of ergotamine tartrate with caffeine in Cafergone tablets has the added advantage of reducing the usual dose of ergotamine necessary to abort these headaches⁽⁴⁾

These measures will abort vascular headaches for 85-90% of sufferers^(1, 4, 6, 7)

- 1 Give complete physical examination including ancillary tests to rule out other conditions mimicing migraine
- 2 Advise the patient to re-organize his activities where possible
- 3 Improve the general health of the patient.
- 4 Give 2 Cafergone tablets at first sign of impending attack and, if necessary additional 1-tablet doses (up to 6) at half-hour intervals

CELL OR PLANT GROWTH
CATHODE-RAY
and/or
MOVING LIGHT BEAM

KYMOGRAPH CAMERA MODEL C4-A

Application Although designed primarily for Electrophysiology, the use of the Kymograph Camera is by no means limited to this field. In the applications listed above, its synchronizing and controlling circuits determine automatically the sequential operation of associated devices such as stimulus, cathode-ray sweep, stroboscopic flash, film advance, shutter opening, etc.

Frame Advance Control by manual switch or external circuit giving single frame advance or repetitive frame advances at rates from 1/min to 4/sec.

Continuously Moving Film Speeds Twelve fixed speeds from 0.25 to 1000 mm/sec $\pm 0.5\%$, all in convenient divisible numbers (1000, 500, 250 etc). Film attains full speed and comes to a stop within 20 milliseconds (about 20 mm of film at maximum speed), thus avoiding film wastage. The duration of film

exposure can be controlled internally up to $\frac{1}{2}$ sec. and externally for longer times.

Recording Materials: 35 mm film or paper, preferably unperforated for oscillographic work, thus giving 60% more image area for full frame exposures.

Optical System: 50 mm Wollensak f-2 lens in self-cocking Synchro-shutter. Prism allows viewing image without loss of film, and recording by moving light beam from the side (such as a mechanical myograph) simultaneously with conventional photographic recording from the front lens.

Magazines 200 ft capacity. Independently removable with automatically closing gates, allowing take-up magazine to be removed for developing partial spools without exposure of remaining film.

Mounting Film may be run vertically or horizontally by using quickly interchangeable mount.

METABOLISM OUTFIT

6412.

METABOLISM OUTFIT FOR THE DETERMINATION OF CALORIE PRODUCTION AND BASAL METABOLIC RATE BY THE DOUGLAS METHOD, with Haldane-Henderson-Bailey Gas Analysis Apparatus This is the simplest of the satisfactory methods for the study of gaseous metabolism It is not limited to an observation of reduction in oxygen volume, but depends upon the collection and analysis of a sample of expired air Outdoor air (O_2 content 20.99%, CO_2 content 0.03%) is inspired through a flutter valve and mask, or mouthpiece and nose clip, and returned on expiration through a second valve, tubing and three-way aluminum stopcock to a Douglas bag From the air so collected during a six-minute interval one or two samples are taken over mercury in gas sampling tubes The bag is emptied through a meter and the volume, temperature and barometric pressure are noted The sample is analyzed in a Haldane-Henderson-Bailey Gas Analysis Apparatus and its CO_2 and O_2 content determined From these data there may be calculated the hourly oxygen consumption, carbon dioxide production, total calorie production and respiratory quotient From these and the height, weight, age and sex of the patient a comparison can be made with the normal and the basal metabolic rate can be computed

See T. M. Carpenter, *Carnegie Institution of Washington Publication 216, 1915, p. 67*, Douglas, *Journal of Physiology, 1911, XLII*, Boothby and Sandiford, "*Laboratory Manual of Basal Metabolic Rate Determinations*", and T. M. Carpenter, *Carnegie Institution of Washington Publication No. 303-A, 1924*

6412 Metabolism Outfit for the Determination of Calorie Production and Basal Metabolic Rate by the Douglas Method, as above described, consisting of Haldane-Henderson-Bailey Improved Model Gas Analysis Apparatus, Gas Meter, Douglas Gas Bag 150 liter, Face Mask, Double Douglas Valve, Three way Tap of aluminum, Bailey Gas Sampling Bottle, Thermometer range 10 to 50 C in $\frac{1}{2}^\circ$, rubber tubing, clamp and thermometer holder complete with directions for assembling and for use 448 45

MILTON O LEE, *Managing Editor*
2101 Constitution Ave , Washington, D C

FEDERATION PROCEEDINGS is published quarterly by the Federation of American Societies for Experimental Biology. The *March* issue consists of the Program (Part II) of the Annual Meeting of the Federation, and the Abstracts (Part I) of the papers presented at the scientific sessions. Both parts include an author index. The abstracts are arranged alphabetically according to the first author and segregated as to Societies. The *June* and *September* issues contain symposia and other special papers presented at Federation meetings as selected by the Editorial Board. The *December* issue contains the membership list and other matters pertinent to the Constituent Societies of the Federation.

Price Schedule

The subscription price is \$4.50 (\$5.25 foreign) payable in advance. Single issues may be purchased, if ordered in advance, at the following prices: No. 1 (Part I, March, Abstracts), \$3.00; No. 1 (Part II, March, Program), 75¢; Nos. 2 and 3 (June and September), \$1.50 an issue; No. 4 (December), \$2.25 an issue. Subscriptions and orders should be sent to the Federation of American Societies for Experimental Biology, 2101 Constitution Ave., Washington 25, D. C.

Entered as second-class matter March 16, 1942, at the Post Office at Baltimore, Maryland, under the Act of August 24, 1912.

mass demonstration in the auditorium

The projectionist can follow a specimen through a progressive series of ever closer localizations, from its gross aspect to its ultimate microscopic demonstration under oil immersion

for example in

The auxiliary Scopicon dark chamber "round table" affords superb facility for small-group study. Here the projected image is cast upon a platen within a light tight chamber, with separate light-excluding viewing hoods for each observer. Any number up to ten may share in conference, which can be conducted in a normally lighted room. A pointer at each port permits any observer to indicate areas of interest to all the others for discussion.

... and for small-group "round-tables" in a normally lighted room

The 64,000 lumen intensity of the Scopicon high-pressure mercury lamp permits auditorium demonstration of tissue sections even under oil-immersed microscope objectives. In projected images six feet or more across, every detail of the cellular structure stands out clearly, due to the pinpoint character of the 1 mm square (approx.) focal spot employed. The Scopicon light is steady and flickerless; its brilliant white color exhibits biological stains to the greatest advantage. May we send you the brochure describing this versatile instrument?

FEDERATION · NOTICE

To facilitate the publication of an accurate and up-to-date Membership List in the December issue of *FEDERATION PROCEEDINGS*, it is requested that *any member whose entry in the December 1950 issue is incorrect* furnish the Secretary of his society with the following data, in duplicate, on 3" x 5" cards: Name, Degree (highest), Mailing Address (street address, city, zone, state), Present Position (title and department or branch), Society membership and year of election to membership in that society. If you are retired, give only degree(s), home address, and society membership(s) with year(s). If you are officially carried on the rolls of your society as a retired or honorary member, please so indicate.

Names and addresses of the Society Secretaries are as follows:

The American Physiological Society—Dr. M. O. Lee, *Executive Secretary*, 2101 Constitution Ave., Washington, D. C.

American Society of Biological Chemists—Dr. E. H. Stotz, University of Rochester School of Medicine and Dentistry, Rochester 7, N. Y.

American Society for Pharmacology and Experimental Therapeutics—Dr. Harvey B. Haag, Medical College of Virginia, Dept. of Pharmacology, Richmond 19, Va.

The American Society for Experimental Pathology—Dr. Sidney C. Madden, Brookhaven National Laboratory, Upton, L. I., N. Y.

American Institute of Nutrition—Dr. J. H. Roe, George Washington University School of Medicine, Washington 5, D. C.

The American Association of Immunologists—Dr. Jules Freund, Public Health Research Institute of the City of New York, Inc., Foot of East 15th St., New York City.

At any future time when you wish a correction made, please notify your Society Secretary by supplying all required information as above. Your Secretary, in turn, will forward the information to the Federation Secretary.

International Accessories

Only an International Centrifuge can offer you such a wide range of interchangeable accessories. No other Centrifuge is so adaptable to your requirements present and future.

Only genuine International heads, metal shields, trunnion rings, cups, and rubber cushions can give you peak performance from your International Centrifuge. Fifty years of engineering experience insure safety, reliability and smooth operation. Each accessory is stamped with the  monogram and each individual piece is test run under overload for your protection.

Illustrated here are a few of the accessories for the International Size 2. Send us the serial number of your Centrifuge and we will gladly send you a descriptive Bulletin listing all of the accessories usable on your machine.

Animal-tested Polyethylene Tubing Simplifies Intravenous Therapy Procedures

Greater comfort to the patient, plus elimination of repeated venipuncture and dangerous tissue reactions, is now assured in intravenous therapy by using Clay-Adams animal-tested polyethylene tubing.

When using polyethylene tubing, which is soft, pliable and chemically inert, there is no danger of vein puncture and the patient's arm need not be immobilized. Hence patient discomfort is minimized.

Need for repeated venipunctures is also eliminated. Polyethylene tubing may be left in the vein and seals readily at the touch of a match flame. Should the need for additional infusions arise, the heat seal is cut off and additional fluids introduced without further puncture.

Polyethylene tubing is introduced into a vein via the lumen of a needle. Once inserted, the needle is withdrawn and the tubing fastened in place with a strip of adhesive tape. Because Clay-Adams polyethylene tubing is animal tested to eliminate tissue reaction, it has been

left in place as an in-dwelling catheter for as long as two weeks.

Polyethylene tubing is also finding wide acceptance in all procedures where in-dwelling catheters and cannulas are called for or would be advantageous, such as caudal and spinal analgesia, drainage tubes, and a variety of experimental work.

Clay-Adams animal-tested polyethylene tubing comes in twenty-three tube sizes, different sized Luer-Lok couplers for coupling tubing to syringe are also available.

Medichromes Available for Most Medical Specialties

Regardless of your specialty, chances are that Clay-Adams probably has a Medichrome series to cover your field of interest. To mention only a few of the more than forty series available, there are Medichromes covering various aspects of the following specialties: clinical pathology,

surgery, dermatology, gynecology, ophthalmology, urology, pediatrics. Subjects are covered from nursing as well as medical phases.

Medichromes are prepared from original normal and pathological specimens, microscopic and gross, under the guidance of a recognized authority in each field.

New Rust Inhibiting Germicide Resists Rust, Film Formation on Instruments and Appliances

RIG concentrate, a new rust inhibiting germicide for the cold disinfection of medical instruments and appliances, protects costly instruments from rust or film even after six months' immersion in RIG, tests reveal Photomicrographs below show the pitting and loss of cutting edge of a scalpel left in a germicide without rust inhibiting features (*left*), and absence of such damage from a scalpel left in RIG (*right*)

Ordinary Germicide

RIG

Concentrated in 10 ml ampules, each ampule of RIG diluted with soft or hard water, makes one quart of highly potent germicide. Germicidal and rust inhibiting features of RIG are retained until solution is discarded. RIG is also available in pint cans for hospital use.

RIG is colorless, odorless and stable, and contains no mercury, phenol or formalin. RIG may be safely used on metal, rubber, plastic or glass instruments and appliances.

You may be interested...

- Determination of the VPRC (Volume Packed Red Cells) for the Wintrobe Sedimentation Test with the Adams Safety Head Centrifuge (Model CT-1002) was found to be 50% more efficient than the conventional free-swinging type operating at the same speed.
- Small size 1½" Dieffenbach Serrefines, favored by experimental biologists for animal surgery, are again available.

Versatile Cannula Outfit Adaptable to Many Gynecological Procedures

The new versatile self-retaining Kahn Uterine Trigger Cannula Outfit, complete with interchangeable tips, is well-suited for many gynecological surgical procedures. It has found wide acceptance for tubal insufflation, uterosalpingography, hysteroscopy, endometrial biopsy.

Basically the outfit consists of a universal trigger handle, an improved style traction tenaculum and a series of interchangeable tips.

Cannula and tenaculum of the Kahn Trigger Cannula Outfit are engaged by a trigger device, permitting one-hand control and simultaneous "push" and "pull" on cannula and tenaculum. The uterus is not displaced; the two opposing forces are synchronized and balanced. The tenaculum is designed to minimize danger of a tear through the cervix.

FEDERATION PLACEMENT SERVICE

THE FEDERATION PLACEMENT SERVICE will begin the following service to heads of departments or laboratories in universities, foundations, industry and government agencies training and/or employing biologists in the fields of the Federated Societies, supplying

- 1 Quarterly lists of available personnel
- 2 Semi-annual lists of position openings
- 3 Annual lists of available fellowships and exchange positions

This will supplant the previous monthly circulation of applicants alone

The Placement Service makes no recommendations as to either positions or candidates, serving only as an information agency. At the annual Spring Meeting of the Federation interviews between employers and candidates are arranged.

Forms for the registration of applicants, positions, fellowships and exchanges are available upon request from

GOVERNMENT REGISTRATION OF SCIENTIFIC PERSONNEL

Within the next few months, approximately 150,000 American scientists will be asked to participate in one of the most comprehensive registrations of scientific personnel yet attempted by the Government. Final plans have been completed for this operation by the National Scientific Register, sponsored by the National Security Resources Board. The registration will be accomplished by means of questionnaires with the direct assistance of the principal professional and scientific societies, and will include qualified scientists in the fields of the biological sciences. The National Research Council has assumed the responsibility of conducting the registration of biological scientists, among others.

Provision has been made for such a register in legislation creating the National Science Foundation. However, because of the international situation early in 1950, the NSRB decided that this important function could not be delayed longer, and that some interim action should be taken pending the creating of the NSF.

The project is a voluntary one with the scientists themselves cooperating with the Government. The National Scientific Register at present does not envision a large-scale placement function. Its purpose is to provide urgently needed information on the country's supply of technological personnel, recorded in such a manner that the system will lend itself to whatever type of placement or distribution program might be required in the future. The National Scientific Register project has been given a high priority by the NSRB in view of the critical role played by American science in the last war, and in recognition of the fact that American security and supremacy in a future war will depend to an important degree on the total utilization of scientific and technological skills. *For this reason, it is considered important that every scientist who is circularized in the current registration return his questionnaire as quickly as possible.*

"HAND" PROCESSING

The tissue, lying at rest merely steeping in a reagent, is surrounded by a "skin" of relatively inactive solution. Permeation is slow, uncertain.

"AUTOTECHNICON" PROCESSING

The tissue moves about in the fluid, as it revolves in the carrier basket. Fresh surfaces are constantly being presented for penetration by a reagent which is, itself, in a state of gentle agitation through the constant rotation of the basket.

it's

"active displacement" that does it

A brochure describing the Autotechnicon is available on request.

Not only does the Autotechnicon relieve the laboratory staff of the tedious task of processing tissues "by hand," but it also completes the chosen technique faster, more thoroughly, more uniformly, more dependably. The Autotechnicon is versatile . . . it fixes, dehydrates, washes, stains . . . delivers beautifully finished tissues ready for diagnosis.

And because it needs no human intervention, it knows no "working day." To-day's tissues, processed overnight by your own technique, will be waiting for you in the morning.

the Autotechnicon

automatic tissue processing

NPH Iletin (Insulin, Lilly)

*and thereby marks another
improvement in diabetes management*

Clinical evidence indicates that single daily injections of NPH Insulin provide an efficiently timed Insulin effect which closely parallels average requirements over a twenty-four-hour period. This new preparation of Insulin eliminates, in most instances, occasion for mixed injections of Insulin and Protamine Zinc Insulin. In severe and complicated cases, supplementary doses of Insulin may be utilized, if indicated.

Federation Proceedings

VOLUME 9

December 1950

NUMBER 4

THIRTY-FIFTH ANNUAL MEETING

CLEVELAND, OHIO

April 29-May 3, 1951

THE 1951 Convention of the Federated Societies will be held in Cleveland, Ohio, April 29 to May 3. The scientific sessions of the six constituent Societies will begin at 9 00 A M, Monday, April 30, in the Public Auditorium and will continue through Thursday afternoon, May 3.

Saturday and Sunday, April 28 and 29, will be devoted to meetings of the Society Councils, the Federation Executive Committee and other committees. The Federation Joint Session will be Monday evening, April 30, in the Music Hall of the Auditorium.

Please note that the Federation scientific sessions have been advanced by one day, beginning on Monday rather than Tuesday as in previous years.

REGISTRATION INFORMATION

Registration will open at 9 00 A M, Sunday, April 29, in the Main Lobby of the Public Auditorium and will remain open until 10 00 P M. Registration desks will be open from 8 00 A M to 5 00 P M, Monday, Tuesday, Wednesday, and Thursday. Since the scientific sessions begin at 9 00 A M on Monday, members are urged to complete registration on Sunday if possible. Members of the constituent Societies, guests, and other biologists and physicians who wish to attend the meetings may register. The official badge issued at the registration desk must be worn to secure admission to the scientific sessions and other activities of the Convention. There will be a separate registration desk for ladies and non-professional guests. Programs, abstracts and tickets for various special functions will be on sale near the registration desk.

HEADQUARTERS HOTELS

Hotel Statler American Physiological Society, American Society for Pharmacology and Experimental Therapeutics, American Society for Experimental Pathology.

Hotel Cleveland American Society of Biological Chemists, American Institute of Nutrition, American Association of Immunologists.

Information on hotels and rates and the forms for making reservations will be distributed to members by the Society Secretaries.

EXHIBITS

Industrial Scientific Exhibits as well as Member and Institutional Exhibits will all be located on the Main Arena Floor of the Public Auditorium. Exhibits inspection periods will be as follows: Sunday, April 29, 2 00 P M-8 00 P M; Monday, Tuesday and Wednesday, April 30, May 1 and 2, 8 00 A M-5 00 P M; Thursday, May 3, 8 00 A M-1 00 P M. The exhibits are officially closed Thursday at 1 00 P M.

Due to the great interest which our members and guests have shown and expressed in the exhibits sections since their inauguration at the 1947 meeting, the Exhibits Committee for the 1951 meeting has given much thought to the screening and selection of exhibitors so as to provide exhibits of diversified interest for all our members and guests.

Three manufacturers of soft drinks and cigarettes will provide lounges on the Arena Floor for the convenience of all visitors and will serve complimentary refreshments.

PLACEMENT SERVICE

An office of the Placement Service of the Federation will be located in the South Hall one flight down from the Arena Floor. Applicants for positions should write to the Federation Placement Service, 2101 Constitution Avenue, Washington 25, D C, for application forms to be returned not later than April 15, 1951. Applicants who have previously filed forms with the Service are requested to notify the office and to send additional data not later than April 15, 1951. The application forms, comprising a résumé of education, training, experience, publications and type of position desired, will be on file at the Placement Service office.

Agencies seeking personnel should write to the Federation Placement Service for employers' registration cards on which to describe the positions and to record the Cleveland addresses. The cards should be returned to the Federation office not later than April 15, 1951. Employers who have previously filed cards should notify the office of their Cleveland address not later than April 15.

MOTION PICTURES

Motion pictures will be shown at one session to be scheduled in the program. The title and the

stract of the film must be submitted to the Society Secretaries. Only 16-mm safety film can be shown, equipment for sound projection will be available.

DINNERS AND LUNCHEONS

There will be ample facilities for holding group breakfasts, luncheons and dinners. It is advantageous to schedule all of these through the Feder-

ation Secretary's office. Members and groups desiring to schedule these functions should make their plans early and inform the Federation Secretary of their requirements before March 15, 1951. Specifications should include attendance expected, desirable time and alternatives, conflicts to be avoided, and screen and lantern requirements for the discussion session following the meal.

FEDERATION BY-LAWS

BY-LAWS

Adopted at the Washington Meeting, 1936, and amended at the Boston Meeting, 1942

1 The Presidents and Secretaries of the Constituent Societies, the Chairman of the Executive Committee of the preceding year and the Federation Secretary shall form the Executive Committee of the Federation

2 The Chairmanship of the Executive Committee shall be held in turn by the Presidents of the Constituent Societies, who shall succeed one another annually in the order of seniority of the Societies

3 The Executive Committee shall appoint annually from the membership of the Federation a Secretary-Treasurer, to be known as the Federation Secretary

4 The Federation Secretary shall (a) Keep the minutes of the Executive Committee and distribute copies to the Secretaries of the Constituent Societies (b) Make arrangements for the Annual Meeting with the Local Committee, with the approval of the Executive Committee (c) Print in convenient combined form and distribute to the membership of the Federation the programs of the Constituent Societies as received from their respective Secretaries (d) Undertake such other duties to be decided upon from time to time by the

Executive Committee, as do not conflict with the complete autonomy of the Constituent Societies

5 The Executive Committee shall control all monies in the hands of the Federation Secretary, who shall make an annual report to the Executive Committee for audit and approval The expenses of the Federation Secretary, as authorized by the Executive Committee, shall be the first charge on such monies and if insufficient for the purpose the Executive Committee shall prorate such expenses to the Constituent Societies of the Federation in proportion to their respective memberships

The Executive Committee may appropriate Federation monies annually for the uses of Local Committees and for the uses of other authorized Committees but in the latter cases an audit of expenditures shall be made and approved before such committees are discharged

6 The Executive Committee shall determine the place of the Annual Meeting, and the time shall be determined by the Local Committee, preferably within the period of March fifteenth to May first

7 The Local Committee at the place of meeting of the Federation shall charge such fee for registration as may be approved by the Executive Committee The monies thus collected shall be used to defray the expenses of the Local Com-

mittee and the remainder, after such expenses have been met, shall be turned over to the Federation Secretary

8 The Executive Committee shall consider measures of advantage to the Federation as a whole. Any Constituent Society may refer similar measures to the Executive Committee. No action, however, shall be taken by the Executive Committee unless specifically authorized by all the Constituent Societies.

9 The Chairman of the Executive Committee may appoint committees when the purposes of such committees have been approved by all the Constituent Societies of the Federation. Such committees shall be appointed for a term of one year, but may be continued and their members reappointed. Such committees shall report in writing to the Executive Committee, which shall in turn report thereon to the Constituent Societies either for information or recommendation. The Secretaries of the Constituent Societies shall report the recommendations of their respective Societies to the Executive Committee for final action.

10 All individuals whose names appear on the program by invitation or introduction and those registering from any recognized biological laboratory may be enrolled as Associate Members of the Federation for that Annual Meeting. Such Associate Members may enjoy all the privileges of the Annual Meeting except that of voting.

11 No person may present orally more than one paper during all of the scientific sessions of the

Constituent Societies at the time of the Annual Meeting except upon invitation of the Executive Committee or a Council. Papers must be submitted to the Secretary of the Society of which the proposer is a member. The proposer may request transfer to another program, but this may only be done with the consent of the Secretary of the Society concerned. Any Secretary who regards any paper submitted to him as better suited to the program of another Society may arrange this transfer with the Secretary of the Society concerned, if it be possible. Such transfer shall be indicated on the program.

12 Abstracts not to exceed two hundred and fifty words in length, of papers approved for presentation at all of the scientific sessions of all the Constituent Societies at the Annual Meeting, shall receive publication in the *Federation Proceedings*.

13 A Control Committee, consisting of at least one representative of each Constituent Society as designated by the several Councils, shall have editorial control over the *Federation Proceedings* which shall be financed as required by an annual assessment of all the members of each Constituent Society.

14 The Control Committee shall have power to choose certain additional papers presented at the Annual Meetings and from other sources, including material heretofore published in the *Federation Yearbook*, for publication in the *Federation Proceedings*.

PROPOSED FEDERATION CONSTITUTION AND BY-LAWS

To the Members of the Constituent Societies

The Federation Executive Committee in 1948 appointed a committee (W. H. Chambers, M. O. Lee and the Society Secretaries) to prepare a draft of a Constitution and a revision of the By-Laws of the Federation. The draft was submitted previous to the 1950 Spring meeting to the Executive Committee, which made various changes and submitted it as a proposed Constitution and By-Laws to the constituent Societies for their consideration. The Executive Committee then voted to publish the proposed Constitution and By-Laws, with further changes suggested by the Societies, in *Federation Proceedings*, so that the mem-

bers of each Society could examine it before their Society takes action.

In the draft below, certain provisions are given in an alternative form as the result of suggestions that have not yet had consideration by the whole Executive Committee. At the coming 1951 Federation meeting these and other suggestions will be considered by the Federation Executive Committee and a final form of the proposed Constitution and By-Laws may be referred to the Societies for their action as to adoption.

Suggestions for changes or additions are solicited and may be sent to the Secretary of your Society or to the Federation Secretary.

CONSTITUTION

ARTICLE I *Name*

The name of this organization is the FEDERATION OF AMERICAN SOCIETIES FOR EXPERIMENTAL BIOLOGY.

ARTICLE II *Purpose*

(Alternative 1) The purposes of the Federation are to bring together investigators in the biological and medical sciences in the fields repre-

sented by its constituent Societies and to disseminate information on the results of biological and medical research through publications and scientific meetings

(*Alternative 2*) The objects of the Federation are to bring together investigators in the biological and medical sciences in the fields represented by the member Societies, to disseminate information on the results of biological research through publications and scientific meetings, and to serve such other purposes as may be approved by the member Societies

[*Alternative 2* is proposed in order to permit the continuation of such Federation activities as the Placement Service]

ARTICLE III *Membership*

SECTION 1 The constituent members of the Federation are The American Physiological Society, Inc, American Society of Biological Chemists, Inc, American Society for Pharmacology and Experimental Therapeutics, Inc, The American Society for Experimental Pathology, Inc, American Institute of Nutrition, Inc, The American Association of Immunologists

SECTION 2 Other Societies in the field of experimental biological science, whose purposes are consonant with those of the Federation, may upon application for membership be admitted, but only by the unanimous consent of the Societies that are members of the Federation at the time of such application

Any constituent Society may withdraw from membership in the Federation one year following written notification to each of the other constituent Societies of its intention to discontinue membership

ARTICLE IV *Management*

(*Alternative 1*) The general management of the Federation shall be vested in a Federation Council consisting of the President and Secretary of each constituent Society and the Chairman of the Federation Council for the preceding year

The Chairmanship of the Federation Council shall be held in turn by the Presidents of the constituent Societies, who shall succeed one another annually in the order of seniority of the Societies in the Federation

(*Alternative 2*) The general management of the Federation shall be vested in a Federation Council consisting of a Chairman and the President and Secretary of each member Society

Each Society, in its turn as determined by seniority in the Federation shall furnish for a one-year term the Federation Council Chairman, who shall have been the President of that Society during the preceding year

[The intent of *Alternative 2* is to insure that the Chairman of the Federation Council shall have served at least one year as a member of the Council previous to becoming its Chairman]

ARTICLE V *Amendments*

Amendments to the Constitution may be entertained only when presented by a constituent Society Any constituent Society may propose amendments to the Constitution to the Federation Council at any annual meeting If the proposed amendment is approved by a majority of the members of the Federation Council, it shall be published in the *Federation Proceedings* and referred to the constituent Societies for ratification at the next annual meeting The proposed amendment shall be adopted if it is ratified by all of the constituent Societies within a period of two years after its publication

(*Alternative 1*) By-laws may be adopted, amended or repealed at any annual meeting by the approval of all of the constituent Societies

(*Alternative 2*) By-laws may be adopted, amended or repealed at any annual meeting by the approval of a majority of the constituent Societies

BY-LAWS

ARTICLE I *The Federation Council*

SECTION 1 The Federation Council shall consider matters affecting the Federation as a whole and matters referred to it by any constituent Society

SECTION 2 The Federation Council shall appoint annually from the membership of the constituent Societies a Secretary-Treasurer, to be known as the Federation Secretary, who may present matters to the Federation Council for decision at its executive sessions or by mail, but who shall not be entitled to vote The Federation Secretary shall be compensated as an employee of the Federation

SECTION 3 The Federation Council shall control all monies of the Federation It shall determine the annual Federation assessment per member of the constituent Societies The assessment shall be applied to the total membership of each Society as of July 1 of each year and shall be due the Federation on that date The Federation Council shall set the subscription rates of Federation publications after considering the recommendations of the Managing Editor, and shall set the fees of the Placement Service The Federation Council may appropriate Federation monies for the use of its authorized committees and for other purposes of the Federation

SECTION 4 The Federation Council shall determine the time and place of the Annual Meeting

upon recommendation of the Federation Secretary. The suggested time shall be during the second, third or fourth week of April.

SECTION 5 *Method of Voting Questions and motions, except those pertaining to Article III, and Article V of the Constitution, put to the Federation Council shall be decided by one of the following three methods*

(a) By majority vote of the members of the Federation Council present. The presence of nine members representing four or more Societies shall constitute a quorum.

(b) By vote by Societies, whereby the two representatives of each Society shall cast a single ballot on behalf of their Society, and a unanimous vote shall be necessary for approval.

(c) By vote of Societies, whereby the matter shall be referred to the Societies for decision. In such case the vote of each Society shall be reported to the Federation Council and recorded. Approval by all of the member Societies shall be necessary for action by the Federation Council.

The method prescribed under (a) of this section shall be followed on all questions in executive session or by mail ballot, unless the two representatives of any Society jointly request that method (b) or (c) of this section be followed. If requests by the representatives of two or more Societies differ as to whether method (b) or (c) shall be used, the method prescribed in (c) shall be followed.

(*Alternative* Omit the words "or by mail ballot" in the last paragraph of Section 5 and add the following as a new paragraph at the end of Section 5.)

Matters referred to the Federation Council for vote by mail ballot shall require unanimous approval if there has been no opportunity for discussion, if such opportunity has been provided either in a Council session or by mail, a majority vote shall prevail unless alternate method (b) or (c) of voting is requested. In either case a mail vote shall require at least nine replies.

SECTION 6 In the absence of the Chairman of the Federation Council at any meeting, the Past-Chairman shall preside. In the absence of the President and/or Secretary of a Society, that Society may authorize a designated alternate to represent it. (*Alternative*) Change "Past Chairman" in Section 6 to "prospective Chairman."

ARTICLE II *Federation Secretary*

The Federation Secretary shall act as Secretary to the Federation Council and be responsible for all Federation records, he shall act as Treasurer of the Federation and shall submit to the Federation Council not later than February of each year financial statements for the previous calendar year audited by a reputable firm of

certified public accountants, he shall be responsible for making the arrangements for the Annual Meeting of the Federation, he shall act as managing editor of the publications of the Federation and be responsible for their business management and for carrying out the editorial policies, he shall supervise the Federation Placement Service and make an annual report on its activity to the Federation Council, he shall perform such other duties as may be prescribed by the Federation Council and which do not conflict with the constitution and by-laws of the constituent Societies.

ARTICLE III *Committees and Representatives*

SECTION 1 The Chairman of the Federation Council shall appoint members of Standing Committees (except the Secretaries Committee), representatives of the Federation to other organizations, and members of such other committees as may be designated by the Federation Council. Members of the committees shall be appointed for specific terms and may be reappointed. Committees shall report in writing through their Chairmen to the Federation Council, which shall in turn report thereon to the constituent Societies for their information, recommendation or action. Any committee using authorized funds of the Federation for its purposes shall have an audit of its expenditures made and approved before it is discharged.

SECTION 2 A Secretaries Committee composed of the Secretaries of the constituent Societies and the Federation Secretary shall be a standing Committee of the Federation. This committee shall meet at the call of the Federation Secretary and shall be responsible for arranging the program of the annual meeting, for setting, upon the recommendation of the Federation Secretary, the registration fees for the annual meeting, and for such other duties as the Federation Council may designate.

(*Alternative 1*) The Chairman of the Secretaries Committee shall be the Secretary of the Society whose President is the Chairman of the Federation Council.

(*Alternative 2*) The Chairman of the Secretaries Committee shall be the Secretary of the Society which furnishes the Chairman of the Federation Council.

ARTICLE IV *Meetings*

SECTION 1 The Federation shall hold an Annual Meeting for the presentation of papers at the scientific sessions of the constituent Societies and the general sessions of the Federation and for the transaction of business by the Federation Council.

SECTION 2 No person may present orally more than one paper during all of the scientific sessions.

of the constituent Societies at the Annual Meeting, except upon invitation of the Chairman of the Federation Council or the Council of a Society

The oral presentation of any paper shall be by the first-named author except by permission of the Secretary of the Society concerned (*Alternative*) Omit the preceding sentence Each Society may make such additional restrictions on its program as it desires

SECTION 3 Papers to be read at the annual meeting of the Federation must be submitted to the Secretary of a Society of which the proposer of the paper is a member A member of a constituent Society may invite non-members to appear as co-authors of a paper with him, or he may propose a paper by non-member authors whom he introduces

SECTION 4 Each Society shall have responsibility for selecting and arranging its scientific program provided the general regulations of the Federation are followed

The authors of a paper may request its transfer to the program of another Society, but this may be done only with the consent of the Secretaries of the two Societies concerned Secretaries on their own initiative may transfer papers from the program of one Society to that of another All transfers of papers shall be indicated in the program

SECTION 5 The abstracts of papers read at the scientific sessions of all of the constituent Societies at the annual meeting shall be published in *Federation Proceedings* Abstracts shall not exceed 275 words in total length, inclusive of titles, authors' names, laboratory and place of origin

ARTICLE V *Publications*

SECTION 1 The official publications of the Federation shall be the *Federation Proceedings* and such other publications as the Federation Council may authorize *Federation Proceedings* shall be owned and published quarterly by the Federation under the supervision of the managing editor and

the Secretaries Committee The March issue shall consist of Part I, containing the abstracts of papers presented or read by title at the Annual Meeting and Part II, the Program of the Annual Meeting The June and September issues shall contain the papers from the Joint Session and Symposia, and other special papers as may be selected by the Secretaries Committee The December issue shall contain the annual membership list and matters of interest to the constituent Societies

ARTICLE VI *Placement Service*

The Federation shall maintain a Placement Service, under the supervision of the Federation Secretary, the function of which shall be to assist in the placing of professional biologists in suitable positions with universities, hospitals, research foundations, industrial research and other organizations seeking such personnel

PLACEMENT SERVICE

The Federation maintains a service to act as a medium of communication between persons seeking positions for teaching or research and institutions that wish to fill vacancies in these sciences

The service does not undertake to recommend or to pass judgment upon applicants It aims merely to serve as a clearing-house for such information as above stated and to bring into touch with one another candidates for positions and employers

Individuals, whether members of the Federation or not, universities, other institutions and organizations desiring to avail themselves of the Service may receive such information as is available By action of the Executive Committee in 1947, a registration fee of one dollar is required of each applicant for a position

All communications should be addressed to Federation Placement Service, 2101 Constitution Ave., Washington 25, D C

THE AMERICAN PHYSIOLOGICAL SOCIETY, INC

Founded December 30, 1887, Incorporated June 2, 1923

OFFICERS, 1950-1951

President—H C BAZETT* (April to July, 1950)
D B DILL, Medical Division, Army Chemical Center, Md

President-Elect—D B DILL (April to July, 1950) Office vacant since July 1950

Past-President—CARL J WIGGERS, Western Reserve University, Cleveland, Ohio

Council—H C BAZETT* (April to July, 1950), D B DILL, C J WIGGERS, R W GERARD (1953), *Secretary-Treasurer*, E M LANDIS (1951), F A HITCHCOCK (1952), E F ADOLPH (1953)

Executive Secretary—M O LEE, 2101 Constitution Ave, Washington, D C

Members of Joint Finance Committee (with Federation)—W O FENN, D B DILL

Board of Publication Trustees—W O FENN, *Chairman* (1952), FRANK C MANN (1951), R F PITTS (1953)

Representative on the Division of Biology and Agriculture, National Research Council—MAURICE B VISSCHER (1952)

Representative on the Division of Medical Sciences, National Research Council—HALLOWELL DAVIS (1953)

Representatives on the Council of the American Association for the Advancement of Science—J H BODINE, (1952), LEIGH CHADWICK (1952)

Historian—WALTER J MEEK

Contributing Editor to Scientific Monthly—JOHN FIELD II

CONSTITUTION

I

1 This Society shall be named "THE AMERICAN PHYSIOLOGICAL SOCIETY, INCORPORATED "

2 The Society is instituted to promote the advance of Physiology and to facilitate personal intercourse between American Physiologists

II

1 The Society shall consist of members and honorary members

2 Any person who has conducted and published meritorious original researches in Physiology and who is a resident of North America shall be eligible for membership in the Society

3 Members who have been relieved by the Council of the payment of the annual assessment shall retain all the rights of members

4 Distinguished men of science who have contributed to the advance of Physiology shall be eligible for election as honorary members of the Society. Honorary members shall pay no membership fee. They shall have the right of attending the meetings of the Society, and of taking part in its scientific discussions, but they shall have no vote

III

1 The management of the Society shall be vested in a Council consisting of a President-Elect, President, Past-President for the previous year, and four other members. The President-Elect and one member of the Council shall be chosen by ballot at the Spring meeting. The President-Elect shall automatically assume the duties of President at the adjournment of the annual meeting following his or her election. The four additional members shall be elected for terms of four years and shall not be eligible to succeed themselves except those who have served for two years or less in filling interim vacancies. A person who has once been President shall not be eligible for re-election as President-Elect. The Council shall select from among its own members a Secretary-Treasurer of the Society and Council. It shall also have the power to appoint and to compensate an Executive Secretary of the Society, who shall not be a voting member of the Council but shall assist it in carrying on the functions of the Society, including the receipt and disbursement of funds under the direction of the Council. If the annual meeting is not held all the members of the Council shall continue in office until their successors are chosen in the prescribed manner in succession.

2 The Council shall define the respective duties of the President, Secretary-Treasurer and Executive Secretary

3 If a member of the Council be elected President-Elect, the vacancy on the Council shall be filled by election of the same meeting, the electee to serve the unexpired term. The Council shall have the power to fill all interim vacancies that may occur in its membership or in any Committee or board of the Society except those for which other provisions have been made

IV

1 At least a fortnight before a meeting of the Society the Executive Secretary shall send to each member a notice of the place and time of each meeting, and shall make such other announcements as the Council shall direct

2 The member assessment shall be determined by the Council and shall be due in advance at the time of the annual meeting. No allocation or disbursement of funds of the Society shall be made except upon prior approval of the Council. Appropriations shall be made by the Council for the conduct of the necessary and appropriate business of the Society

3 Any member whose assessment is two years in arrears shall cease to be a member of the Society, unless at the next Spring meeting he shall be reinstated by special vote of the Society, and it shall be the duty of the Secretary-Treasurer to notify the said delinquent of his right to appeal at the said meeting

4 Any member who has retired because of illness or age may, upon application to the Council, be relieved from payment of the annual assessment

V

1 A meeting of the Society for transacting business, the election of officers and members, and presenting communications shall be held in the Spring, except in the case of national emergencies or other exceptional circumstances, when the Council may decide on postponement. The time and place of such meetings shall be determined by the Council in consultation with the Executive Committee of the Federation of American Societies for Experimental Biology

2 A Fall meeting of the Society may be held at a time and place determined by the Council for presenting communications and transacting any business except the election of officers and members. Special meetings may be held at such times and places as the Council may determine

VI

1 Proposed amendments to the Constitution must be brought up at one meeting for preliminary discussion and approval by a majority vote and cannot be adopted except by a two-thirds vote at a business session at the next Spring meeting

Notice of such changes shall be sent to all members at least two weeks prior to the meeting at which they are scheduled for adoption

2 At all business meetings of the Society twenty-five members shall form a quorum

3 By-laws for the conduct of the Society may be adopted, altered, or repealed at any business meeting by two-thirds vote of the ballots cast

VII

1 The Council may, from the names of the candidates proposed in writing by at least two members of the Society, nominate candidates for election to membership. The names of the candidates so nominated and a statement of their qualifications for membership signed by their proposers shall be available for inspection during the business sessions of the Society at which their election is considered. The candidates may be balloted for at any session of the same meeting and a majority vote shall elect. If a Spring meeting is not held, the Society shall elect candidates to membership at the next Spring meeting

2 Honorary members shall be proposed by the Council, and shall be elected by a majority ballot of the members present at the Spring meeting of the Society

VIII §

1 If a majority of the Council shall decide that the interests of the Society require the expulsion of a member, the Secretary-Treasurer shall send a notice of this decision to each member at least two weeks before the next annual meeting. At this meeting the Secretary-Treasurer shall on behalf of the Council, propose the expulsion, and if two-thirds of the members present vote for it, the member shall be expelled, and his assessment for the current year shall be returned to him, and he shall cease to be a member of the Society

IX

1 The official organs of the Society shall be the *American Journal of Physiology*, the *Journal of Applied Physiology*, *Physiological Reviews* and such other publications as the Society shall establish. These the Society shall own and they shall be managed according to the provisions of Article X

X

1 The President of the Society shall appoint, in consultation with the Council and subject to

the approval of the Society, three members of the Society to serve as members of a Board of Publication Trustees

2 The initial appointments shall be for one, two and three years. Thereafter, each member shall be appointed for three years, and shall be eligible for one immediate reappointment. He may be subsequently reappointed, but only after the lapse of at least one year between reappointments

3 The Board of Publication Trustees shall be vested with full power of the Society to control and manage, both editorially and financially, all of the publications owned in whole or in part by the Society, to appoint editorial boards, to appoint and compensate a Managing Editor, and to control all publication funds, none of which, however, may be diverted from support of publications of the Society except by consent of the Council

4 The Board of Publication Trustees shall make a full report to the Council at each annual meeting of the financial condition and publication policy of the Journals or other publications

BY-LAWS

1 All papers read before the Society shall be limited to a length of ten minutes. No person may orally present more than one paper. In case of joint authorship the name of the individual who will orally present the paper shall stand first

2 Abstracts in duplicate, not to exceed two hundred and fifty words in length, of all papers to be presented at the annual meeting of the Society shall be required by the Secretary for publication in the *Federation Proceedings*, in accordance with rules approved by the Council

3 The Council shall upon the request of twenty-five members call a regional meeting of the Society at any time and place, for the reading of papers and the promotion of personal intercourse. Such a request shall be made in writing at least six weeks before the proposed date of meeting. Such meeting shall be held in accordance with the Constitution and By-laws of the Society, and if the regular officers of the Society cannot be present the President shall appoint a committee from among the petitioners to conduct the meeting. The Committee through a Secretary chosen by them shall forward an account of the scientific proceedings of the meeting to the official Secretary of the Society for insertion in the minutes

4 No general business of the Society shall be transacted at such regional meetings

CONSTITUTION

FROM THE ARTICLES OF INCORPORATION

1 The name of the proposed corporation is "AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS, INCORPORATED"

2 The purposes for which this corporation is formed are to further the extension of biochemical knowledge and to facilitate personal intercourse between American investigators in biological chemistry

BY-LAWS

ARTICLE I *Membership*

SECTION 1 *Eligibility for Membership* Qualified investigators who have conducted and published meritorious original investigations in biological chemistry shall be eligible for membership in the Society

SECTION 2 *Nomination* Nominations for membership shall be made and seconded by members of the Society on blanks furnished by the Secretary. Nominations shall be submitted to the Council who shall determine eligibility and make recommendation to the Society at a regular meeting

SECTION 3 *Election to Membership* A A nominee for membership may be voted for by ballot at any meeting of the Society after the Council has reported its findings on his eligibility. The eligible candidate shall be reported by the Council as "eligible" or as "eligible and indorsed" B A majority of the ballots cast shall elect

SECTION 4 *Forfeiture* A Any member who may grant the use of his name for (a) the advertisement of a patent medicine, a proprietary food preparation or any other commercial article of doubtful

value to the public or possibly harmful to the public health, or (b) who may concede its use for the purpose of encouraging the sale of individual samples (of any such product) that he has not examined, shall forfeit his membership

B The Council shall have authority to announce forfeiture of membership, provided that the copy of the charges, together with a written notice of a hearing thereon by the Council at a place and time specified in such notice, shall have been delivered to the member charged with violating the preceding section either personally or mailed to him at his last known address at least thirty days before the date of such hearing

SECTION 5 *Expulsion* Upon the recommendation of the Council any member may be expelled by a majority vote of the total membership at a meeting of the Society, provided that a copy of the charges against him, together with a written notice of a hearing thereon by the Council at a place and time specified in such notice shall have been delivered to him personally or mailed to him at his last known address at least thirty days before the date of such hearing

ARTICLE II *Meetings and Quorum*

SECTION 1 *Annual* The annual meeting of the Society shall be held on the date fixed by the Certificate of Incorporation

SECTION 2 *Special* A special meeting may be called at any time by the President, or in case of his absence or disability, by the Vice-President, and must be called at the request of a majority of the Council or fifteen members of the Society. A notice specifying the purpose of such meeting shall be mailed to each member at least ten days previous thereto. The Council shall select the places at which meetings shall be held

SECTION 3 *Quorum* Fifteen members shall constitute a quorum at all meetings of the Society, but in absence of a quorum any number shall be sufficient to adjourn to a fixed date

ARTICLE III *Officials*

SECTION 1 *Officers* The officers shall be a President, a Vice-President, a Secretary, and a Treasurer, who shall be elected annually by the members of the Society

SECTION 2 *Council* A The Officers so elected and three additional members, one of whom shall be elected at each annual meeting of the Society to serve a three year term, shall constitute the Board of Directors of the corporation and shall be known as "The Council" (When this provision is first put into effect three members will need to be elected for a one, a two and a three year period)

B No two members of the Council may be from the same institution and none of the officers shall

elected shall be eligible for re-election for more than two years except the Secretary and Treasurer, who shall be eligible for re-election for five years. The three additional members of the Council shall be ineligible for re-election (until after the lapse of one year)

SECTION 3 *Duties of Officers* The powers and duties of the officers elected by the Society shall be such as usually devolve upon their respective positions

SECTION 4 *Assistant Treasurer* A The Council may from time to time appoint a trust company, or some member of the Society, to serve during the pleasure of the Council as Assistant Treasurer, and to act as depositary of the investments and income of the "Christian A Herter Memorial Fund" and of such other funds as the Society may from time to time commit to its or his charge

B The Assistant Treasurer shall have and exercise the following powers and duties, viz, the custody and safe-keeping of securities and cash belonging to the "Christian A Herter Fund" and the collection of income and other moneys due to the Fund, with power to receipt for the same and to endorse for deposit all checks payable to the Society or the Treasurer, or to the Journal of Biological Chemistry for income or other moneys due to the Fund, the investment or reinvestment of the capital of the Fund, subject to the approval of the Council, the disbursement of principal under the direction of the Council and the disbursement of income under the direction of the Editorial Board of the Journal of Biological Chemistry, such disbursement to be made under a resolution of the Council or Board, or with the approval of two members of either the Council or Board, as the case may be. The Assistant Treasurer shall keep books of account and render statements, annually or oftener upon the request of the Council or Board setting forth the condition of the Fund and the receipts and disbursements since the date of the preceding statement

ARTICLE IV *The Council*

SECTION 1 *Powers* The general management of the Society during the intervals between meetings shall be vested in the Council, which shall regularly perform the ordinary duties of an executive committee and possess all the powers conferred upon the Board of Directors of a membership corporation by the Membership Corporation Law of the State of New York

SECTION 2 *Reports* The Council shall report to the Society as promptly as possible its findings on the eligibility of candidates for membership, and on all charges of a violation of these By-Laws

SECTION 3 *Journal of Biological Chemistry* The Council shall have power to appoint the persons to act as proxies for the Society at all meetings of

the stockholders of the "Journal of Biological Chemistry" (a corporation) of which all the stock is owned by the Society, and also to designate the persons to be elected as Directors of such corporation

SECTION 4 *Herter Fund* It shall be the duty of the Council to see that the "Christian A Herter Memorial Fund" is administered in accordance with the terms of the Trust Agreement, Dated May 16, 1911, executed by the Journal of Biological Chemistry and the donors of said Fund

ARTICLE V *Nominating Committee*

SECTION 1 *Membership* A The Nominating Committee shall consist of nine members from nine different institutions elected at each annual meeting to serve for the ensuing year. Members who have served on the Nominating Committee for two consecutive years shall be ineligible for re-election until after the lapse of one year

B The member of the Nominating Committee who is elected to the Committee by the largest number of votes shall become Chairman and Secretary of the Committee

SECTION 2 *Nomination of Officials* A The Nominating Committee shall make at least one nomination for each of the four offices and for each of the three additional positions in the Council to be filled by vote of the members

B The nominations by the Nominating Committee must be transmitted to the Secretary at least one month before the annual meeting at which they are to be considered

C The Secretary shall send to every member, at least two weeks before the annual meeting, two copies of the list of nominees presented to him by the Nominating Committee and at the same time shall notify all the members that they may vote by proxy

D At the opening of the first executive session of the ensuing annual meeting the Secretary shall formally present the regular nominations for the Nominating Committee

E Additional nominations for the offices and for membership in the Council may be made by any member at the opening of the first executive session of any annual meeting

F Nominations for membership on the Nominating Committee shall be made by or for individual members, either in person or by proxy, and not otherwise, at the opening of the first executive session of any annual meeting

SECTION 3 *Election of Officials* A The Secretary shall receive and present to the tellers, appointed by the President to take charge of the election, all signed ballots forwarded by absent members. When such ballots are presented to the tellers the Secretary shall announce the names of the mem-

bers voting by proxy, and he shall record the same names in the minutes of the meeting

B All elective officials shall be selected by ballot at the close of the first executive session of each annual meeting

C A majority of the votes cast shall be necessary to elect an official

D Elective officials shall take office on July 1st following the annual meeting

SECTION 4 *Filling of Vacancies* A The Nominating Committee shall fill all vacancies in elective positions except such as may occur at a meeting of the Society

B The President of the Society shall fill all vacancies in appointive positions

ARTICLE VI *Financial*

SECTION 1 *Dues* Annual assessments shall be determined by majority vote at the annual meetings, upon the recommendation of the Council, and shall be due January 15th in each year. Members who have reached the age of 65 years, or who have become incapacitated, may, by vote of the Council, be exempted from the payment of dues

SECTION 2 *Expenditures* No expenditures from the general funds of the Society except those required in the performance of the ordinary official duties shall be made except by vote of the Society or the Council, but this section shall not apply to expenditures from the "Christian A. Herter Memorial Fund"

SECTION 3 *Privileges of Membership Begin with Payment of Dues* Candidates for membership, if elected, shall not be entitled to any of the privileges of membership, before they pay the dues of the fiscal year succeeding their election

SECTION 4 *Penalty for Non-Payment of Dues* A Members in arrears for dues for a period of three consecutive years shall thereupon forfeit their membership

B Delinquent members may be reinstated by the Council provided all indebtedness to the Society is liquidated

SECTION 5 *Herter Fund* The "Christian A. Herter Memorial Fund" shall be held and invested separately from the general funds of the Society and the income thereof shall be expended under the direction of the Editorial Board exclusively for the maintenance and support of the Journal of Biological Chemistry, subject to the supervision and control of the Editorial Committee in accordance with the terms of the Trust Agreement mentioned in ARTICLE IV, SECTION 4, and the provisions of ARTICLE XII of the By-Laws

ARTICLE VII *Journal of Biological Chemistry*

SECTION 1 *Editorial Committee* There shall be an Editorial Committee consisting of nine members of the Society who shall be nominated by the

Nominating Committee and elected by the Society in the same manner as officers. The nine members first elected shall divide themselves by lot into three classes of three in each class, to serve for two, four, and six years respectively, and thereafter three members shall be elected at each alternate annual meeting of the Society to succeed the members of the outgoing class and to serve for a term of six years. Members of the Committee shall be eligible to re-election

SECTION 2 *Powers of Committee* The Committee shall have power to elect an Editorial Board and shall have final authority in matters pertaining to the general policy of the Journal

SECTION 3 *Editorial Board* The members of the Board shall hold office until their successors are elected and shall appoint a Managing Editor from among their own number who shall have direct responsibility and authority for the active editorial conduct of the Journal, and who shall have discretionary power in arranging the details as to the conduct of the Journal. The expenditures of the income of the "Christian A. Herter Memorial Fund" shall be under the direction of the Board, and the approval of any two members of the Board shall be a sufficient warrant to authorize payments from such income

ARTICLE VIII *Papers on Scientific Subjects*

SECTION 1 *Presentation of Papers* The Secretary shall request each member who signifies his intention of reading a paper at any session to specify the length of time which its presentation will require. The time thus specified shall be printed on the official program, and the presiding officer shall have no authority to extend it unless a majority of the members present signify their wish to the contrary. In the absence of any specification of time required not more than ten minutes shall be allotted for the reading of any one paper

SECTION 2 *Number of Papers* No member shall be permitted to present more than one paper, either alone or in collaboration, until every member shall have had the opportunity of presenting one paper

ARTICLE IX *Corporate Seal*

SECTION 1 The corporate seal of the corporation shall be a circle surrounded by the words, "AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS," and including the word, "INCORPORATED"

ARTICLE X *Amendments*

SECTION 1 *Amendments* These By-Laws after having been approved by the Council and adopted by the Society at its first annual meeting shall not be amended except as hereinafter provided

SECTION 2 *Manner of Presentation Proposed*

amendments to the By-Laws must be sent to the Secretary at least one month before the date of the meeting at which they are to be considered and must be indorsed in writing by at least three members

SECTION 3 *Notice of Intended Amendments*
Secretary shall give every member notice of proposed amendments at least two weeks before the meeting at which they are to be considered and shall notify all members that they may vote by proxy

SECTION 4 *Adoption of Amendments* A The Secretary shall receive and present to the tellers

appointed by the President all signed ballots forwarded by absent members When such ballots are presented to the tellers, the Secretary shall announce the names of members voting by proxy, and he shall record the same names in the minutes of the meeting

B Votes upon amendments shall be cast at the opening of the second executive session of the meeting at which they are considered

C Affirmative votes from three-fifths of the members voting shall be required for the adoption of an amendment

AMERICAN SOCIETY FOR PHARMACOLOGY AND EXPERIMENTAL THERAPEUTICS, INC

Founded December 28, 1908 Incorporated June 19, 1933

OFFICERS, 1950-1951

President—CARL F SCHMIDT, University of Pennsylvania School of Medicine, Philadelphia

Vice-President—McKEEN CATTELL, Cornell University Medical College, New York City

Secretary—HARVEY B HAAG, Medical College of Virginia, Richmond

Treasurer—K K CHEN, Lilly Research Laboratories, Indianapolis, Ind

Council—CARL F SCHMIDT, McKEEN CATTELL, HARVEY B HAAG, K K CHEN AND LOUIS S GOODMAN, THOMAS C BUTLER, ARTHUR C DE GRAFF, Councilors

Membership Committee—ROBERT P WALTON (1950), JOHN C KRANTZ, JR (1951) J H COMROE, JR (1952)

Nominating Committee—OTTO KRAYER, *Chairman*, W T SALTER, WALTON VAN WINKLE, JR, ALFRED GILMAN, M H SEEVERS

Historian—WILLIAM DEB MACNIDER

Committee on International Pharmacological Congress—M L TAINTER, *Chairman*, OTTO KRAYER, H B VAN DYKE

Representatives to the Council of the American Association for the Advancement of Science—ARNOLD D WELCH, HARVEY B HAAG

CONSTITUTION

ARTICLE I *Name*

The name of this organization shall be the "AMERICAN SOCIETY FOR PHARMACOLOGY AND EXPERIMENTAL THERAPEUTICS, INCORPORATED"

ARTICLE II *Objects*

The purpose of this Society shall be to promote these branches of science and to facilitate personal intercourse between investigators who are actively engaged in research in these fields

ARTICLE III *Membership*

SECTION 1 Any person who has conducted and published a meritorious investigation in pharmacology or experimental therapeutics, and who is an active investigator in one of these fields, shall be eligible to membership, subject to the conditions of the other sections of Article III

SECTION 2 A Candidates for membership to this Society shall be proposed by two members who are not members of the Council The names so proposed shall be sent to the Secretary at least three months prior to the Annual Meeting

B The Membership Committee shall investigate the qualifications of the candidates and report to the Council

C Candidates reported upon by the Membership Committee to the Council may be recommended for admission by the Council only provided they have been approved by four-fifths of the combined membership of the Membership Committee and the Council

D The names of the candidates recommended for admission by the Council shall be posted by the Secretary not later than the day preceding the election for members

E The election of members shall be by individual ballot, one opposing vote in every eight cast shall be sufficient to exclude a candidate from membership

SECTION 3 *Forfeiture of Membership*

A Any member whose assessment is three years in arrears shall cease to be a member of the Society, unless he shall be reinstated by a special vote of the Council, and it shall be the duty of the Treasurer to inform the Secretary that he may notify the said delinquent of his right to appeal to the Council

B If the Council shall decide that it is for the best interests of the Society that a member be expelled, the member shall be notified and given an opportunity of a hearing before the Council Upon the recommendation of the Council the member then may be expelled by a three fourths vote of those present at a regular meeting of the Society

SECTION 4 *Honorary Members*

A Distinguished men of science who have contributed to the advance of pharmacology or experimental therapeutics shall be eligible for election as honorary members of the Society

B Nominations for honorary members shall take the same course as nominations for ordinary

members (Art III, Sec 2), but their election shall require the unanimous vote of the members present at the election

C Honorary members shall pay no membership fee They shall have the right to attend all meetings of the Society, and to take part in its discussions, but they shall have no vote

D The conditions for continuation of membership shall be the same for honorary as for ordinary members (Art III, Sec 3), except that forfeiture for arrears of fees does not apply to honorary members

ARTICLE IV *Officers and Elections*

SECTION 1 *Officers and Committees*

A The management of the Society shall be vested in a Council of seven officers consisting of a President, President-Elect, Secretary, Treasurer of the Society, and three Councilors-at-Large

B The President-Elect, Secretary, Treasurer and one Councilor-at-Large shall be elected at each annual meeting The Secretary and Treasurer may succeed themselves The President-Elect shall assume the duties of President at the adjournment of the next annual meeting following his election No person who has served as President is eligible for re-election as President-Elect

C The three Councilors-at-Large shall serve for a period of three years, and shall not be eligible for immediate re-election

D There shall be a Membership Committee, consisting of three members No two members shall be from the same institution The election of the Membership Committee shall be held annually at the time when the election of officers occurs At the first meeting of the Society under this constitution, one member shall be elected to serve on the Committee for three years, one for two years, and one for one year, and subsequently one member shall be elected each year to serve for a period of three years

E There shall be a Nominating Committee of five members No two members shall be from the same institution Members of the Nominating Committee shall serve for one year They are eligible for re election, but shall not hold membership in the Committee for more than two consecutive years

F No person may hold dual membership on the Council, Membership or Nominating Committees

G Members of the Nominating Committee are not eligible to nomination for other office

SECTION 2 *Nomination of Officials and Committeemen*

A The Nominating Committee shall make at least one nomination for each office and for the position on the Membership Committee to be filled by vote of the members The nominations so made

shall be transmitted to the Secretary and by him in turn to the members, at least one month before the annual meeting

B Nominations for membership on the Nominating Committee shall be made by individual members at the time of the annual election The five nominees who receive the highest numbers of votes shall be declared elected The Nominating Committee shall select its own Chairman who shall serve as Secretary to the Committee

SECTION 3 *Election of Officials and Committeemen*

A At the opening of the first executive session of the annual meeting the Secretary shall give to each member present a printed ballot showing the nominations of the Nominating Committee After accepting additional nominations from individual members present a complete list of nominees shall be posted A preliminary vote shall then be taken and the tellers, appointed by the President to conduct the election, shall post immediately a final list showing the two nominees for each office receiving the highest number of votes At the close of the first session, a final vote shall be taken A majority of votes cast shall be necessary to a choice

B Such vacancies as may occur in the offices and in the various committees in the interval between annual meetings shall be filled by a majority vote of the Council

ARTICLE V *Meetings*

SECTION 1 The annual meeting of the Society shall be held at a time and place determined by the Council in consultation with the Executive Committee of the Federation of American Societies for Experimental Biology

SECTION 2 Special meetings may be held at such times and places as the Council may determine

SECTION 3 At least four weeks before the annual meeting the Secretary shall send to each member a notice of the time and place of such meeting and shall make such announcements as the Council may direct

ARTICLE VI *Financial*

SECTION 1 The annual assessment shall be determined by majority vote at the annual Spring meeting upon the recommendation of the Council, and shall be due at the close of each such meeting

SECTION 2 Beyond the ordinary expenditures required by the routine business of the Society no money shall be disbursed save by the authority of the Council or Society

SECTION 3 The treasurer shall make an annual report to the Society

SECTION 4 All publication funds shall be kept in a separate account subject to the control of the Board of Publications Trustees except that

none of these funds may be diverted from the support of publications of the Society except by consent of the Council or the Society. A financial report shall be made by the Board at each annual meeting.

ARTICLE VII *Quorum*

Ten members shall constitute a quorum for the transaction of business.

ARTICLE VIII *By-Laws*

By-Laws shall be adopted, altered or repealed at any meeting by two-thirds vote of the ballots cast.

ARTICLE IX *Amendments*

SECTION 1 Intended amendments to the Constitution shall be sent to the Secretary at least one month before the date of the meeting at which they are to be considered, and must be indorsed in writing by at least three members.

SECTION 2 The Secretary shall give all members due notice of proposed amendments.

SECTION 3 A four-fifths vote of the members present shall be required for the adoption of an amendment.

ARTICLE X *Official Publications*

SECTION 1 The President of the Society shall appoint, in consultation with the Council, and subject to the approval of the Society, three members of the Society to serve as members of a Board of Publications Trustees, these members shall elect a Managing Editor for each of the official journals of the Society, and each Managing Editor, during the term of his service, shall act as an additional voting member of the Board of Publications Trustees and shall participate in all the activities of the Board except that of election of managing editors of the journals of the Society.

SECTION 2 The members of the Board of Publications Trustees, hereinafter termed "The Board," shall each serve for a term of three years, shall be subject to reappointment, and may hold office concurrently in the Society. At the first appointment, however, one member shall be appointed for three years, one member for two years, and one member for one year, in order that in the future, appointments may be made annually in rotation. The Board shall meet at least once annually (a quorum shall consist of three members) and shall report directly to the Society.

SECTION 3 The special functions of The Board shall be to consider and to investigate thoroughly all matters pertaining to the fiscal and editorial policies of the journals which may come to the

Society or to its Council, to the Managing Editors, and to the members of The Board. The Board shall (1) administer the finances of the journals, (2) establish the publication policies of the journals, and (3) elect a Managing Editor for each of the journals of the Society (as described in Sec 1).

SECTION 4 The Managing Editor of each journal shall nominate to The Board, members of the Society acceptable to him as Associate Editors. In the event that the Society should develop an International Journal, foreign Associate Editors who are not members of the Society are eligible for nomination and appointment to the Editorial Board of said Journal. From those nominated, The Board shall elect, for each journal, Associate Editors in such number as they shall consider adequate to fulfill the duties of that Editorial Board. The Managing Editor and each Associate Editor shall serve for three years, subject to reappointment, and may hold office concurrently in the Society. In the choice of The Boards of Editors, The Board is charged with the responsibility of obtaining editors with expert knowledge in the several fields of pharmacological research and with evidenced ability for critical and grammatical expression.

SECTION 5 The Boards of Editors of the journals shall meet on call of the respective Managing Editor, if possible just prior to or during the regular meetings of the Society, and may make recommendations to The Board concerning the improvement of the publication policies of the journals.

BY-LAWS

1 Papers to be read shall be submitted by the members of the Society to the Secretary, who, with the President, shall be empowered to arrange the program. No person may orally present more than one paper. In case of joint authorship, the name of the individual who will orally present the paper shall stand first. Papers not read shall appear on the program as read by title.

2 An abstract of a paper to be read before the Society shall be sent to the Secretary with the title. As early as possible after each meeting, the Secretary shall edit and publish the *Proceedings* of the Society together with abstracts in a publication authorized by the Society.

3 All applications for membership shall be accompanied by a copy of as many reprints as possible of the published work of the applicant.

4 Any member who has been an active member for thirty years, or who has retired for disability or age, may upon notification to the Treasurer be relieved from payment of dues.

THE AMERICAN SOCIETY FOR EXPERIMENTAL PATHOLOGY, INC.

Founded December 29, 1913

OFFICERS, 1950-1951

President—JAMES F RINEHART, University of California Medical School, San Francisco

Vice-President—F S ROBSCHT-ROBBINS, University of Rochester School of Medicine and Dentistry, Rochester, N Y

Secretary-Treasurer—SIDNEY C MADDEN, Brookhaven National Laboratory, Upton, Long Island, N Y

Councilors—D MURRAY ANGEVINE (1949-51), RUSSELL L HOLMAN (1950-52), JAMES F RINEHART, F S ROBSCHT-ROBBINS, SIDNEY C MADDEN

Representative on the Division of Medical Sciences of the National Research Council—JOHN G KIDD (1949-52)

Representatives on the Council of the American Association for the Advancement of Science—MALCOLM H SOULE (1949-52), E B KRUMBHAAR (1949-52)

Representatives on the Eli Lilly Award Committee (jointly with the Society of American Bacteriologists)—*For nominations* PAUL R CANNON (1951) *For award* PEYTON ROUS (1951)

Representative on the Committee for the Placement Service—DOUGLAS H SPRUNT

CONSTITUTION

ARTICLE I *Name*

The Society shall be named "THE AMERICAN SOCIETY FOR EXPERIMENTAL PATHOLOGY"

ARTICLE II *Object*

The object of this Society is to bring the productive investigators in pathology, working essentially by experimental methods, in closer affiliation with the workers in the other fields of experimental medicine

ARTICLE III *Time and Place of Meeting*

The Society shall meet at the same time and place as the Federation of American Societies for Experimental Biology, which comprises at present the American Physiological Society, the American Society of Biological Chemists, the American Society for Pharmacology and Experimental Therapeutics, the American Society for Experimental Pathology, the American Institute of Nutrition and the American Association of Immunologists

ARTICLE IV *Membership*

SECTION 1 Any American investigator who, through the use of experimental methods, has, within three years prior to his candidacy, contributed meritorious work in pathology, is eligible to membership

SECTION 2 It shall be the policy of the Society to restrict its membership to as small numbers as is compatible with the maintenance of an active existence

SECTION 3 There shall be two classes of members active and honorary members

Active members Candidates for active membership shall be nominated at or before an annual meeting by two members of the Society. The nominators shall present to the Secretary in writing evidence of the candidate's qualifications for membership. Nominations approved by the Council shall be presented to the Society for election at the next annual meeting following nomination. For election a favorable ballot by a majority of the members present is necessary.

Honorary members These may be elected from the active list or from the group of distinguished investigators at home or abroad who have contributed to the knowledge of pathology by experimental study. They shall be elected only by the unanimous vote of the members present at time of nomination.

SECTION 4 Active members shall pay such annual dues as are determined upon, from year to year, by the Council. Honorary members shall pay no dues, are not eligible to office, and have no vote in the business affairs of the Society, but they shall have all the privileges of the active members in the scientific proceedings.

SECTION 5 Upon failure of an active member to pay dues for two years, notice shall be given to the member by the Secretary. At the end of the third year, if dues are still unpaid, such failure constitutes forfeiture of membership.

SECTION 6 A motion for expulsion of a member must be thoroughly investigated by the Council, at this investigation the accused shall be afforded a hearing or may be represented by a member. Expulsion can be accomplished only after a unanimous vote by the Council in favor of expulsion, sustained by a four-fifths vote of the members present at the meeting.

ARTICLE V *Officers*

The management of the Society shall be vested in a Council of five members, consisting of a President, a Vice-President, a Secretary-Treasurer, and two other members who shall be nominated by the Council and elected by the Society. Officers are elected by a majority vote and remain in office until July 1 following the Federation

Meeting Vacancies shall be filled by the Council for the unexpired term

The President and Vice-President shall hold office for one year and are ineligible for re-election during the following year The Secretary-Treasurer is eligible for re-election Councilors shall hold office for two years and are elected on alternate years At the first election one Councilor shall be elected for a short term of one year

ARTICLE VI *Quorum*

SECTION 1 Three constitute a quorum of the Council The Council decides by a majority vote

SECTION 2 A quorum of the Society for transaction of business shall be one-fourth of the total membership In all questions brought before the Society a majority vote of those present shall decide, except as elsewhere provided for

ARTICLE VII *Annual Meeting*

SECTION 1 Papers shall be limited to ten minutes However, on motion and with unanimous consent, the time may be prolonged by a period not exceeding five minutes The Council may make provision for longer papers on suitable occasions

SECTION 2 The subjects of papers must be confined to experimental work in pathology In doubtful cases a liberal interpretation by the President and Secretary may prevail The Council may invite, however, presentations dealing with any subject which it considers of considerable interest to the Society

ARTICLE VIII *Change of Constitution*

A motion concerning a change of the Constitution must be presented to the Council in writing by three members, and must be communicated to the members by the Secretary at least four weeks before the annual meeting At this meeting such a change may be established when accepted by a four-fifths vote of the members present

BY-LAWS

1 There must be in each year at least one meeting of the Council, which shall take place not later than the evening before the annual meeting

2 At the end of the first session of the annual meeting the Secretary shall read the report of the Council This report shall include (1) names of persons recommended for membership, (2) nominations for offices, (3) matters of general interest The Secretary shall exhibit in a conspicuous place the names of candidates for membership recommended by the Council, together with the evidence of the qualifications of the candidates

3 The election of officers and of new members, changes in the Constitution, etc., shall be voted upon at the end of the first session

4 Changes in the By-Laws may be determined by a majority vote of those present

5 In the year that a new Secretary-Treasurer is elected the incoming Council Member elected that year, or another member of the Council, shall become Assistant Secretary-Treasurer for the duration of the term of the Secretary-Treasurer

AMERICAN INSTITUTE OF NUTRITION, INC
Founded April 11, 1933, Incorporated November 16, 1934

CONSTITUTION

1 The name of the proposed society is the "AMERICAN INSTITUTE OF NUTRITION"

2 The purposes of the society are to further the extension of the knowledge of nutrition and to facilitate personal contact between investigators in nutrition and closely related fields of interest

3 The management of the American Institute of Nutrition shall be vested in a council consisting of the President, Vice-President, Secretary, Treasurer and three additional members

BY-LAWS

ARTICLE I Membership

SECTION 1 *Eligibility for membership* Members Qualified investigators who have independently

conducted and published meritorious original investigations in some phase of the chemistry or physiology of nutrition and who have shown a professional interest in nutrition for at least 5 years shall be eligible for membership in the Society

SECTION 2 *Nomination* Nominations for membership shall be made and seconded by members of the Society on blanks furnished by the Secretary. Nominations shall be submitted to the Council who shall determine eligibility and make recommendation to the Society at a regular meeting

SECTION 3 *Election to membership* A A nominee for membership may be voted for by ballot at any meeting of the Society after the Council has reported its findings on his eligibility B A majority of the ballots cast shall elect

SECTION 4 *Forfeiture* If a majority of the Council after due notice to the member in question and opportunity for a hearing, shall decide that the interests of the Society require the expulsion of a member, the Secretary shall send a notice of this decision to each member at least two weeks before the next annual meeting At this meeting the Secretary shall, on behalf of the Council, propose the expulsion, and if two-thirds of the members present vote for it, the member shall be expelled, his assessment for the current year shall be returned to him, and he shall cease to be a member of the Society

ARTICLE II *Meetings and Quorum*

SECTION 1 *Annual* The annual meeting of the Society shall be held on the date fixed by the Certificate of Incorporation

SECTION 2 *Special* A special meeting may be called at any time by the President, or in case of his absence or disability, by the Vice-President, and must be called at the request in writing of a majority of the Council or fifty members of the Society Notice specifying the purpose of such meeting shall be mailed to each member at least ten days previous thereto The Council shall select the places at which meetings shall be held

SECTION 3 *Quorum* Thirty members shall constitute a quorum at all meetings of the Society, but in the absence of a quorum any number shall be sufficient to adjourn to a fixed date

ARTICLE III *Officials*

SECTION 1 *Officers* The officers shall be a President, and a Vice President who shall be elected annually, and a Secretary and Treasurer, each of whom shall be elected to serve for a term of three years These officers shall be elected by the members of the Society Their terms of office shall commence on July 1 of the year in which they are elected

SECTION 2 *Council* The officers so selected and three additional members, one of whom shall be elected at each annual meeting to serve a term of three years, shall constitute a Board of Trustees and shall be known as "The Council" (When this provision is first put into effect one member shall be elected for 1 year, one for 2 years and the third for 3 years)

SECTION 3 *Duties of Officers* The powers and duties of the officers elected by the Society shall be such as usually devolve upon their respective positions

ARTICLE IV *The Council*

SECTION 1 *Powers* The general management of the Society during the intervals between meetings shall be vested in the Council, which shall regularly perform the ordinary duties of an executive committee and possess all the powers conferred upon the Board of Trustees of an educational institution chartered by the Education Department of the University of the State of New York A permanent charter was issued to the American Institute of Nutrition under date of November 16, 1934

SECTION 2 *Reports* The Council shall report to the Society its findings on the eligibility of candidates for membership, and on all charges of a violation of these By-Laws

ARTICLE V *Nominating Committee*

SECTION 1 *Membership* A The Nominating Committee shall consist of five members appointed for the coming year by the retiring President Members who have served on the Nominating Committee for two consecutive years shall be ineligible for reappointment until after a lapse of one year B The President shall designate one member to be Chairman of the Nominating Committee

SECTION 2 *Nomination of Officials* A The Nominating Committee shall make at least one nomination for each of the four offices, for each of the additional positions on the Council to be filled by vote of the members and for each of the positions on the Editorial Board to be vacated at the time of the annual meeting Any member of the Institute may submit nominations to the Nominating Committee for its consideration along with those nominations made by the members of the Nominating Committee B The nominations by the Nominating Committee shall be transmitted to the Secretary at least six weeks before the annual meeting at which they are to be considered C The Secretary shall send to every member, at least two weeks before the annual meeting a printed ballot containing the list of nominees and space for such additional names as the mem-

ber wishes to propose, and at the same time shall notify the members that they may vote by mail, returning to the Secretary the marked ballot in the envelope provided, at such a time and place as the Secretary may designate, or the ballot may be delivered to the Secretary at the beginning of the business session at which the elections are to take place

SECTION 3 *Election of officials* A At the beginning of the business session the Secretary shall present to the tellers, appointed by the President, the ballots submitted by the members and the ballots shall be counted forthwith B A majority of votes cast shall be necessary to elect an official

SECTION 4 *Filling of Vacancies* A The Nominating Committee shall fill all vacancies in elective positions except such as may occur at a meeting of the Society B The President of the Society shall fill all vacancies in appointive positions

ARTICLE VI *Financial*

SECTION 1 *Dues* The dues shall be the annual cost of subscription to *The Journal of Nutrition* for members plus an annual assessment which shall be determined by majority vote at the annual meetings, upon recommendation of the Council, and shall be due within a month after the annual meeting A member on attaining the age of 65 may elect to be relieved from all financial obligations to the Institute including subscription to *The Journal of Nutrition*

SECTION 2 *Expenditures* No expenditures from the general funds of the Society except those required in the performance of the ordinary official duties shall be made except by vote of the Society or the Council

SECTION 3 *Penalty for non-payment of dues* A Members in arrears for dues for two consecutive years shall forfeit their membership B Delinquent members may be reinstated by the Council provided all indebtedness to the Society is liquidated

ARTICLE VII *The Journal of Nutrition*

SECTION 1 The American Institute of Nutrition designates *The Journal of Nutrition* as its official organ of publication

SECTION 2 In accordance with the expressed wish of the Wistar Institute of Anatomy and

Biology, owner and publisher of *The Journal of Nutrition*, the American Institute of Nutrition shall nominate members of the Editorial Board for its official organ A The editorial management of *The Journal of Nutrition* shall be vested in an Editorial Board consisting of an Editor and twelve Board Members B The Editor shall be chosen by the Editorial Board to serve a term of five years beginning July 1 of the year in which he is chosen, and shall be eligible for reelection The Editor shall have the power to designate one of the Board Members to serve as his assistant, and such an appointee shall be called Associate Editor C Three members of the Institute shall be nominated by the Nominating Committee for membership on the Editorial Board each year to serve a term of four years, replacing three retiring members and taking office May 1 of the year in which they are elected In the event of a vacancy in the membership of the Editorial Board occurring through death or other reason, the Nominating Committee, for each such vacancy to be filled shall make an additional nomination In this event the nominees elected who receive the greatest number of votes shall serve the longest term of vacancies to be filled D Retiring members of the Editorial Board shall not be eligible for renomination until one year after their retirement

ARTICLE VIII *Papers on Scientific Subjects*

SECTION 1 The Secretary shall be authorized to arrange programs for the scientific sessions at the annual meetings

ARTICLE IX *Changes in Constitution and By-Laws*

SECTION 1 Proposed changes in the Constitution and By-Laws must be sent in writing to the Secretary at least one month before the date of the meeting at which they are to be considered, and must be signed by at least three members The Secretary shall send a printed copy of any proposed change to each member at least two weeks before the next meeting and shall notify all members that they may vote by proxy

SECTION 2 If at this meeting two-thirds of the votes cast shall favor the proposed change, it shall be made

THE AMERICAN ASSOCIATION OF IMMUNOLOGISTS

Founded June 19, 1913, Member of Federation 1942

OFFICERS, 1950-1951

President—GEOFFREY EDSALL, Boston University School of Medicine, Boston, Mass

Honorary President—ARTHUR F COCA, Oradell, N J

Vice-President—COLIN M MACLEOD, New York University College of Medicine, New York City

Secretary-Treasurer—JULES FREUND, Public Health Research Institute, New York City

Council—THOMAS FRANCIS, JR, JOHN F ENDERS, THOMAS P MAGILL, MICHAEL HEIDELBERGER, GEOFFREY EDSALL, COLIN M MACLEOD, JULES FREUND

PAST OFFICERS

CONSTITUTION

(As revised, 1949)

ARTICLE I Name

This association shall be called THE AMERICAN ASSOCIATION OF IMMUNOLOGISTS

ARTICLE II Object

The purpose of the Association shall be to advance knowledge of immunology and related disci-

plines, and to facilitate interchange of ideas and information among investigators in the various fields

ARTICLE III Members

SECTION 1 The Association shall consist of active members, members emeriti and honorary members

SECTION 2 Any qualified person engaged in the study of problems related to the purpose of the Association may apply for active membership. Candidates for active membership shall be nominated by two members of the Association on blanks furnished by the Secretary. Applications must be accompanied by letters of recommendation of the sponsors, a curriculum vitae, and a list of reprints of publications. The Council shall determine eligibility and post a list of candidates at the annual meeting. The membership shall elect new members by majority vote.

SECTION 3 Failure to pay dues for three successive years shall annul membership. The Council may reinstate a member if an acceptable explanation is submitted and all indebtedness to the Association is liquidated. Payment of such indebtedness may be waived by unanimous vote of the Council if circumstances justify such action.

SECTION 4 If a two-thirds majority of the Council decides that the best interests of the Association require the expulsion of a member, the Secretary shall notify the affected member in writing of the charges. The Council shall allow a reasonable time for the presentation of his defense before acting. Upon recommendation of a two-thirds majority of the Council, the Secretary shall send a notice of the decision to each active member at least six weeks before the next annual meeting. At this meeting the Secretary shall, on behalf of the Council, propose the expulsion, and on a two-thirds vote of the members present, the member shall be expelled, his assessment for the current year shall be returned, and he shall cease to be a member of the Association.

SECTION 5 An active member of the Association for twenty years upon retirement because of age or disability may elect to accept the status of member emeritus. As such he shall retain voting privileges but shall be relieved of all financial obligations to the Association and shall not receive the Journal without payment.

SECTION 6 The Council may nominate for honorary membership persons of extraordinary achievement in the field of endeavor of this Association. Election to honorary membership shall

follow the same procedure as that for election for office in the Association, and the Secretary, on order of the Council, shall place nominations for honorary membership on the annual ballot

ARTICLE IV *Officers*

SECTION 1 The Association shall be governed by a Council, which shall consist of the Officers of the Association and five Councilors, one of whom shall be the Editor-in-Chief of the Journal of Immunology

SECTION 2 The Officers of the Association shall be a President, a Vice President, a Secretary, and a Treasurer. The duties of the two latter may be performed by one or two individuals as determined by vote of the Association (See By-Law # 7)

SECTION 3 The President, the Vice President, the Secretary, and the Treasurer shall be elected at the regular annual meeting of the Association to serve for one year. Only the Secretary and the Treasurer are eligible to serve for successive terms in their respective offices. The term of office shall begin the day after the end of the annual meeting

SECTION 4 One Councilor shall be elected each year to serve for a term of four years. He may however serve in any other elective office immediately after expiration of his term as Councilor

SECTION 5 The President shall appoint a Nominating Committee of three (or more) members not currently serving on the Council of the Association and shall designate the Chairman. The Committee shall submit nominations for the offices of President, Vice President, Secretary, Treasurer, and Councilor. They may nominate the member currently serving as Vice President for the office of President, and the Councilor who is serving his fourth year for the office of Vice President. They shall submit the names of three members of the Association as candidates for the office of Councilor for a four-year term. The Nominating Committee shall confer at least three months before the annual meeting and shall transmit its nominations, over the signatures of the majority of the Committee, to the Secretary at least two months before the annual meeting. Other names may be added to the ballot upon petition of at least twenty-five members of the Association to the Secretary at least two months before the annual meeting. The Secretary shall send to each member of the Association, at least six weeks before the annual meeting, a ballot containing the list of all such nominees

SECTION 6 The members of the Association shall vote on the nominations by secret ballot by mail. All ballots must be in the hands of the Secretary one week before the annual meeting. At the time of the annual meeting the Secretary shall present all the valid sealed ballots received by him to the

tellers appointed by the President. A plurality of votes shall be sufficient for election

SECTION 7 The Vice President shall substitute for the President when necessary. If both the President and Vice President are unable to serve, the senior Councilor shall temporarily assume the duties of President. Should a vacancy occur in the office of Secretary or Treasurer, or Councilor, the Council by a majority vote shall appoint a member to fill the unexpired term until the following election. In the event of a vacancy in the Council, the members shall in the following election choose two Councilors from among six nominees whose names shall be selected by the Nominating Committee and included on the ballot as above. More over, in this event the terms of the four Councilors shall be adjusted so as to provide an orderly progression within the general sense of the Constitution

ARTICLE V *Meetings*

SECTION 1 A regular meeting of the Association shall be held annually at such time and place as the Council shall determine. Regular meetings shall be open to all members of the Association. The members present at the annual meeting of the Association shall constitute a quorum

SECTION 2 A meeting of the Council shall be held prior to the annual business meeting of the Association. A quorum of the Council for this meeting shall be five

SECTION 3 In case of equal division of votes, the President shall cast the decisive ballot

SECTION 4 Minutes of the annual meeting of the Council and of the annual business meeting of the Association shall be published in the form of a news-letter and be distributed only to members of the Association. The annual report of the Treasurer shall be included in this news-letter

ARTICLE VI *Business*

SECTION 1 The fiscal year of the Association shall begin March first

SECTION 2 Annual dues, upon recommendation of the Council, shall be determined by a majority vote at the annual meeting of the Association

ARTICLE VII *Publication*

SECTION 1 The Journal of Immunology, which is the property and official organ of this Association, shall be administered for the Association by an Editorial Board

SECTION 2 An Editor-in-Chief shall be elected from the membership by a majority vote of the Council to serve for four years. His term of office shall be subject to renewal. He shall appoint with the consent of the Council an Editorial Board of four to six members to serve for four years. The Editor-in-Chief and the members of the Edi-

torial Board shall be responsible for the editorial conduct of the Journal

SECTION 3 The Editor-in-Chief shall, with the consent of the Council, appoint from the active members Associate Editors as needed. These Associate Editors are to be chosen because of their ability in specialized fields.

SECTION 4 The Editor-in-Chief shall make a report of his stewardship of the Journal at the annual meeting and in this report shall summarize the editorial situation and all matters dealing with finances. He shall submit to the Council statements relating to the number of manuscripts received, rejected, accepted, and published during the year, changes in editorial personnel of editors, a complete summary of circulation and of finances and of any other information which the Editorial Board may feel to be pertinent or which may be required by the Council.

ARTICLE VIII *Amendments*

SECTION 1 Proposed changes in the Constitution shall be submitted by at least five members in writing through the Secretary to the President. The President shall then appoint a committee of at least three members which shall communicate its recommendations to the President for consideration by the Council. The Council shall then advise the Secretary to submit the recommendations of the committee to the membership of the Association for approval with the annual ballot. A change in the Constitution shall require a two-thirds majority of the votes cast by the members at the annual meeting and shall require confirmation by a majority in a mail vote in which at least 50% shall have participated.

SECTION 2 As an alternative procedure a proposed change in the Constitution may be submitted directly to the Council by petition of one-tenth of the total active membership. Under this circumstance the Council is required to arrange for a vote by the members as heretofore described.

SECTION 3 Proposed changes in By-Laws may be adopted by two-thirds vote of members present at the annual meeting.

BY-LAWS

1 The Past Presidents shall have the right of attending, without vote, the meetings of the Council.

2 The President may appoint a Past President or a Past Councilor as pro tempore Councilor at any stated meeting of the Council at which a quorum is not present.

3 The Council may transact and vote by mail on such business as cannot be conveniently transacted at meetings.

4 The Secretary shall arrange the program for the scientific meetings, with the advice of the other officers of the Association. Any member in good standing shall have the right to submit a paper. The privilege of presentation may be extended to non-members upon recommendation of active members. Papers intended for presentation at the meetings shall conform to the standards of the Journal of Immunology. In case of doubt, the Secretary shall have the right to submit papers to the scrutiny of three or more members of the Editorial Board of the Journal of Immunology whose decision shall be final.

5 Each member who signifies his intention of reading a paper at any session may specify the length of time which its presentation shall require. In the absence of any specification of time required not more than ten minutes shall be allotted for the reading of any one paper. The time allotted shall be printed on the official program, and the presiding officer shall have no authority to extend it unless a majority of the members present signify their wish to the contrary.

6 If by force of circumstances it should be impossible to hold the annual meeting, the election of Officers and Council may be carried out entirely by mail.

7 The offices of Secretary and Treasurer are combined and shall be held by one person.

8 Official or invited addresses presented at the annual meeting shall be given immediate priority in publication, unless the Editor-in-Chief shall be otherwise instructed by majority vote of the Council.

9 Dues are payable on or before January 1st and subscriptions to the Journal will be lapsed if not paid by this date.

10 If the Editor-in-Chief is unable to attend the stated meeting of the Council, he may designate an alternate from the membership of the Editorial Board.

ALPHABETICAL LIST OF MEMBERS OF THE SIX SOCIETIES

- (1) The American Physiological Society
- (2) American Society of Biological Chemists
- (3) The American Society for Pharmacology and Experimental Therapeutics
- (4) The American Society for Experimental Pathology
- (5) The American Institute of Nutrition
- (6) The American Association of Immunologists

*Number and year in parentheses following each name indicate Society affiliation and year of election
R signifies retired status*

HONORARY MEMBERS

- Adrian, E D Cambridge University, Dept of Physiology, Cambridge, England (1, 1946)
- Bremer, Frederick, M D 115 Boulevard de Waterloo, Brussels, Belgium *Prof of Pathology, Univ of Brussels, Dir of Lab of General Pathology, Pres of College des Medecins de l'Agglomeration de Bruxelloise* (1, 1950)
- Chopra, R N, M D, Sc D School of Tropical Medicine, Calcutta, India *Director, Professor of Pharmacology* (3, 1938)
- Coca, Arthur F, A M, M D Pearl River, N Y (6, 1916)
- Dale, H H, O M, G B E, M D, F R C P, F R S The Wellcome Trust, 28 Portman Sq, Malet St, London, W 1, England (3, 1926)
- Hektoen, Ludvig, M D 629 S Wood St, Chicago, Ill *President, Chicago Tumor Institute* (6, 1919)
- Hess, Walter Rudolf, M D Univ of Zurich, Physiological Inst, Zurich, Switzerland *Dir, Swiss Physiological Inst* (1, 1950)
- Hill, Archibald Vivian, C H, O B E, Sc D, L L D, F R S 16 Bishopswood Rd, London N 6, England *Foulerton Research Prof of Royal Society, Univ College, London* (1, 1950)
- Houssay, Bernardo A M D Viamonte 2790, Buenos Aires, Argentina *Director and Professor of Physiology* (1, 1942)
- Lapicque, L The Sorbonne, Laboratory of Physiology, Paris, France (1, 1946)
- Liljestrand, Gornan, M D Caroline Inst, Stockholm, Sweden *Prof of Pharmacology* (1, 1950)
- Loewi, Otto, M D 155 E 93rd St, New York City 28 *Research Professor in Pharmacology N Y U College of Med* (3, 1941)
- McCoy, George Walter, M D Louisiana State University Medical School, New Orleans *Director, Department of Public Health* (6, 1916)
- Novy, Frederick G, M D, Sc D 721 Forest Ave, Ann Arbor, Mich *Dean Emeritus and Professor Emeritus of Bacteriology, University of Michigan Medical School* (6, 1920)

Orbeli, L A Academy of Sciences of the USSR, Moscow, USSR (1, 1946)

Sherrington, Sir Charles S, Sc D, M D "Broomside," Valley Road, Ipswich, England, *Former Waynesfete Professor of Physiology, Oxford University Former President of the Royal Society* (1, 1904)

MEMBERS

- Abbot, Lynn D F, Jr Ph D Med College of Virginia, Richmond 19 *Assoc Prof of Biochemistry* (2, 1948)
- Abramson, David I, M D Univ of Illinois, Dept of Medicine, Chicago 12 *Asst Clin Prof Attending Physician, Hines Veterans Hospital* (1, 1937)
- Abramson, Harold A, M D Mt Sinai Hospital, New York City *Chief, Allergy Clinic, Asst Prof of Physiology, Columbia Univ College of Physicians and Surgeons* (1, 1930, 2, 1934)
- Abreu, Benedict E, Ph D, M D Pitman-Moore Co, Indianapolis, Ind *Pharmacologist, Research Dept* (3, 1941)
- Acheson, George H, M D Univ of Cincinnati College of Medicine, Cincinnati, Ohio *Prof of Pharmacology* (1, 1942, 3, 1945)
- Adams, Georgian, M A, D Sc U S Dept of Agriculture, Washington 25, D C *Sr Exper Station Admin* (5, 1946)
- Adams, John M, M D Univ of California, 405 Hilgard Ave, Los Angeles 24 *Prof of Pediatrics* (4, 1947)
- Adams, Mildred, Ph D Agricultural Research Center, Bureau of Human Nutrition and Home Economics, Beltsville, Md *Biochemist, Food and Nutrition* (2, 1934)
- Adams, R Charles, C M, M D Mayo Clinic, Rochester Minn *Assoc Prof of Anesthesiology Mayo Foundation, Consultant Mayo Clinic Section on Anesthesia* (3, 1942)
- Adams, W Lloyd, M D, Ph D 1300 First Natl Bank Bldg, Lexington 6 Ky *Practicing Ophthalmologist* (3, 1942)
- Adams, Wright R, M D Univ of Chicago Dept

- of Medicine, Chicago 37, Ill *Assoc Prof of Medicine* (1, 1946)
- Addison, William H**, M D Univ of Pennsylvania, Philadelphia *Prof Emeritus of Histology and Embryology* (1R, 1928)
- Ades, Harlow Whiting**, Ph D Box 734, Emory Univ, Ga (1, 1945)
- Adler, Harry F**, Ph D, M D School of Aviation Medicine, Randolph AFB, Tex *Dir Med Sciences Div* (1, 1943)
- Adolph, Edward Frederick**, Ph D, Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Prof of Physiology* (1, 1921)
- Adolph, William H**, Ph D 25 Maple St, New Haven, Conn *Prof of Biochemistry, Peiping Union Med College, Peiping, China* (2, 1946, 5, 1934)
- Ahlquist, Raymond P**, Ph D Med College of Georgia, Augusta *Prof and Chairman of Dept of Pharmacology* (3, 1945)
- Albanese, Anthony A**, Ph D St Luke's Convalescent Hospital, Nutrition Research Lab, King St, Greenwich, Conn *Chief of Nutritional Research* (2, 1944)
- Albaum, Harry G**, Ph D Brooklyn College, Bedford Ave and Ave H, Brooklyn, N Y *Asst Prof of Biology* (2, 1947)
- Albert, A**, Ph D, M D Mayo Foundation, Rochester, Minn *Research Assoc* (1, 1947)
- Albritton, Errett C**, M D George Washington Univ Med School, 1339 H St, N W, Washington, D C *Prof and Head of Dept of Physiology* (1, 1933)
- Alden, Roland H**, Ph D Univ of Tennessee, College of Medicine, Memphis 3 *Prof and Head, Dept of Microscopic Anatomy* (1, 1949)
- Alexander, Robert S**, Ph D Western Reserve Univ School of Medicine, 2109 Adelbert Rd, Cleveland, Ohio *Instr in Physiology* (1, 1946)
- Algire, Glenn H**, M D Natl Cancer Inst, Bethesda, Md *Sr Surgeon, USPHS* (4, 1945)
- Allan, Frank N**, M D Lahey Clinic, 605 Commonwealth Ave, Boston, Mass *Exec Dir of the Med Dept* (4, 1930)
- Allen, Charles Robert**, Ph D, M D Univ of Texas School of Medicine, Galveston *Assoc Prof of Anesthesiology* (1, 1943)
- Allen, Frank W**, Ph D Univ of California, 1557 Life Science Building, Berkeley *Assoc Prof* (2, 1947)
- Allen, Frederick M**, M D 1031 Fifth Ave, New York City *Prof of Medicine, Polyclinic Med School and Hospital* (1R, 1924, 4, prior to 1920)
- Allen, J Garrott**, M D Univ of Chicago, Univ Clinics, Chicago, Ill *Instr in Surgery* (1, 1943)
- Allen, Lane**, Ph D, M D Med College of Georgia, Univ Place, Augusta *Assoc Prof of Anatomy* (1, 1939)
- Allen, Shannon C**, Ph D U S A F School of Aviation Medicine, Randolph AFB, Tex *Chief, Applied Human Biology Branch* (1, 1945)
- Allen, Thomas H**, Ph D Columbia Univ College of Physicians and Surgeons, Dept of Physiology, 630 W 168th St, New York City 32 *Asst Prof of Physiology* (1, 1947)
- Allen, Willard E**, M D Washington Univ School of Medicine, 630 S Kingshighway, St Louis, Mo *Prof of Obstetrics and Gynecology* (1, 1934)
- Allen, William F**, Ph D Univ of Oregon Med School, Portland *Prof Emeritus of Anatomy* (1R, 1929)
- Alles, Gordon A**, Ph D 770 S Arroyo Parkway, Pasadena, Calif *Lecturer in Pharmacology, Univ of California Med School, and Research Assoc in Biology, California Inst of Technology* (1, 1932, 3, 1941)
- Ailing, Eric L**, M D Univ of Rochester School of Medicine and Dentistry, Rochester 7, N Y *Assoc in Radiology* (4, 1947)
- Allison, James B**, Ph D Rutgers Univ, New Brunswick, N J *Prof of Physiology and Biochemistry, Dir of Bureau of Biological Research* (2, 1946, 5, 1949)
- Almquist, Herman J**, Ph D The Grange Co, Modesto, Calif *Dir of Research and Vice Pres* (2, 1937, 5, 1937)

- Baez, Silvio**, M D 525 E 68th St, New York City 32 *Research Assoc* (1, 1950)
- Bahrs, Alice M**, Ph D 2735 Orchard St, Corvallis, Ore (1, 1933)
- Bailey, Cameron Vernon**, C M, M D New York Univ and Hospital 303 E 20th St, New York City *Chn Prof of Medicine* (2, 1920, 5R, 1933)
- Bailey, Orville T**, M D Harvard Univ Med School, 25 Shattuck St, Boston 15, Mass *Asst Prof of Pathology* (4, 1939)
- Bailey, Percival**, M D, Ph D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago 12, Ill *Prof of Neurology and Neurosurgery* (1, 1941)
- Baitsell, George Alfred**, Ph D Yale Univ, Osborn Zoological Lab, 165 Prospect St, New Haven, Conn *Prof of Biology* (1, 1915)
- Baker, A B**, M D Univ of Minnesota Hospital, 19 Millard Hall, Minneapolis *Dir and Prof of Neurology and Neuropathology* (4, 1940)
- Baker, Edgar E**, Ph D Boston Univ School of Medicine, 80 E Concord St, Boston 18, Mass *Assoc Prof of Microbiology* (6, 1950)
- Baker, James A**, D V M, Ph D Cornell Univ New York State Veterinary College, Ithaca *Prof of Bacteriology* (4, 1947)
- Baker, Roger D**, M D Med College of Alabama, Birmingham 5 *Prof of Pathology* (4, 1939)
- Baldes, Edward J**, Ph D 427 Fifth Ave, S W, Rochester, Minn *Asst Prof of Physics, Mayo Foundation, Univ of Minnesota Grad School* (1, 1930)
- Baldwin, Francis Marsh**, Ph D Univ of Southern California, Los Angeles *Prof of Zoology and Dir of Exper Marine Biology* (1, 1919)
- Bale, William F**, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Prof of Radiation Biology* (1, 1943)
- Ball, Eric G**, Ph D Harvard Med School, 25 Shattuck St, Boston 15, Mass *Prof of Biological Chemistry* (2, 1934)
- Ball, Howard A**, M D 233 A St, San Diego, Calif *Pathologist, Paradise Valley and Palomar Memorial Hospitals* (4, 1947)
- Balls, Arnold Kent**, Ph D Enzyme Research Lab, U S Bureau of Agricultural and Industrial Chemistry, Western Regional Research Lab, 800 Buchanan St, Albany 6, Calif *Head Chemist* (2, 1932)
- Bang, Frederik B**, M D Johns Hopkins Hospital, Baltimore, Md *Assoc Prof in Medicine* (4, 1947)
- Banus, Mario Garcia**, D Sc Bright Meadows, Chestertown, Md (1, 1927)
- Bard, Philip**, Ph D, Johns Hopkins Univ School of Medicine, 710 N Washington St, Baltimore, Md *Prof and Dir of Dept of Physiology* (1, 1929)
- Barger, A Clifford**, M D Harvard Med School, Dept of Physiology, 25 Shattuck St, Boston 15, Mass *Associate* (1, 1950)
- Barker, H A**, Ph D Univ of California, 3048 Life Sciences Bldg, Berkeley 4 *Prof of Plant Biochemistry* (2, 1946)
- Barker, S B**, Ph D State Univ of Iowa College of Medicine, Iowa City *Assoc Prof of Physiology* (1, 1938)
- Barlow, O W**, M D, Ph D 3 Warwick Rd, Winchester, N H (3, 1944)
- Barnes, B O**, Ph D Box 967, Station Hospital,

- KAAF, Kingman, Ariz *Prof of Health Education, Univ of Denver* (1, 1932)
- Barnes, LaVerne A, Ph D Naval Med Research Inst, Natl Naval Med Center, Bethesda 14, Md *Head, Bacteriology Facility* (6, 1931)
- Barnes, Richard Henry, Ph D Sharp & Dohme, Glenolden, Pa *Asst Dir of Research* (2, 1941, 5, 1944)
- Barnes, Thomas C, D Sc Hahnemann Med College and Hosp of Philadelphia, Philadelphia, Pa *Assoc Prof of Pharmacology, Electroencephalographer of Hahnemann Hospital* (1, 1942, 3, 1948)
- Barnum, Cyrus P, Jr, Ph D Univ of Minnesota, 210 Millard Hall, Minneapolis 14 *Assoc Prof of Physiological Chemistry* (2, 1946)
- Barott, Herbert G, E E U S Dept of Agriculture, Natl Agricultural Research Center, Beltsville, Md *Biophysicist, Animal Nutrition Div, Bur of Animal Industry* (5R, 1938)
- Barron, Donald H, Ph D Yale Univ School of Medicine, New Haven, Conn *Assoc Prof of Physiology* (1, 1943)
- Barron, E S Guzman, M D Univ of Chicago, Dept of Medicine, Chicago 37, Ill *Assoc Prof of Biochemistry* (2, 1931)
- Bartlett, Paul D, Ph D Edsel B Ford Inst for Med Research, Henry Ford Hospital, Detroit 2, Mich *Sr Assoc in Biochemistry* (2, 1950)
- Bartley, S Howard, Ph D P O Box 763, East Lansing, Mich (1, 1935)
- Bass, Allan D, M D Univ of Syracuse School of Medicine, Syracuse, N Y *Prof of Pharmacology* (3, 1944)
- Batchelder, Esther L, Ph D 8 Devon Rd, Silver Spring, Md *Head of Food and Nutrition Div, Bureau of Human Nutrition and Home Economics* (5, 1933)
- Bateman, John B, Ph D Physical and Chemical Div, Camp Detrick, Frederick, Md (1, 1945)
- Bates, Robert W, Ph D E R Squibb and Sons, Biological Labs, New Brunswick, N J *Head of Endocrine Development Dept* (2, 1936)
- Batson, Herbert C, Ph D Army Med Center, AMDR & GS, Washington, D C *Scientific Dir, Dept of Biological Products* (6, 1949)
- Batterman, Robert C, M D New York Univ - Bellevue Med Center, 477 First Ave, New York City *Asst Prof of Medicine* (3, 1941)
- Bauer, J H, M D Rockefeller Foundation, 20 Rue de la Biome, Paris, (8^e) France (4, 1935)
- Bauer, Walter, M D Massachusetts General Hospital, Boston *Assoc Prof and Tutor in Medicine, Harvard Med School* (1, 1929)
- Bauernfeind, J C, Ph D Hoffmann-LaRoche, Inc, Nutley 10, N J *Chief of Applied Nutrition* (5, 1947)
- Bauman, Louis, M D Columbia Presbyterian Med Center, 180 Fort Washington Ave New York City 32 *Asst Prof of Clin Medicine (retired), Columbia Univ* (2, 1912)
- Baumann, Carl A, Ph D Univ of Wisconsin, Biochemistry Dept, Madison *Prof of Biochemistry* (2, 1938, 5, 1938)
- Baumann, Emil J, Ph D 7 Church Lane, Scarsdale, N Y *Chemist, Montefiore Hospital* (2, 1922)
- Baumberger, J Percy, Sc D Stanford Univ, Physiology Dept, Stanford Univ, Calif *Prof of Physiology* (1, 1921)
- Baxter, James H, M D Natl Insts of Health, Natl Heart Inst, Bethesda, Md (3, 1948)
- Bayne-Jones, Stanhope, M A, M D New York Hospital, Cornell Med Center, 525 E 68th St, New York City 21 *Pres, Joint Admin Board* (4, 1927, 6, 1917)
- Beach, Eliot F, Ph D Metropolitan Life Insurance Co, 1 Madison Ave, New York City 10 *Research Biochemist* (2, 1941, 5, 1942)
- Beadle, Buell W, Ph D 606-A, Essex Circle, U S N O T S, China Lake, Calif (2, 1947)
- Bean, John W, Ph D, M D Univ of Michigan, Ann Arbor *Prof of Physiology* (1, 1932)
- Beard, Howard H, Ph D Terrell's Labs of Clin Medicine, Med Arts Bldg Rm 24, Fort Worth, Tex *Biochemist* (2, 1928)
- Beard, Joseph W, M D Duke Hospital, Durham, N C *Prof of Surgery, Assoc Prof of Virology* (4, 1938, 6, 1940)
- Beatty, Clarissa H, Ph D Univ of Oregon Med School, Portland *Research Fellow* (1, 1949)
- Beazell, James Myler, Ph D, M D 104 S Michigan Ave, Chicago, Ill *Instr in Physiology and Pharmacology, Northwestern Univ School of Medicine* (1, 1939)
- Beck, Claude S, M D Lakeside Hospital, Cleveland, Ohio *Prof of Neurosurgery, Western Reserve Univ, Assoc Surgeon, Lakeside Hospital* (4, 1930)
- Beck, Lyle V, Ph D 5609 Roosevelt St, Bethesda, Md (1, 1941)
- Becker, R Frederick, M S, Ph D Daniel Baugh Inst of Anatomy, 307 S 11th St, Philadelphia, Pa (1, 1949)
- Beckman, Harry, M D Marquette Univ School of Medicine, Milwaukee, Wis *Dir of Dept of Pharmacology* (3, 1937)
- Beecher, Henry K, M D Massachusetts General Hospital, Boston *Anesthetist-in-Chief, Dorr Prof of Research in Anesthesia, Harvard Med School* (3, 1940)
- Beerstecher, Ernest, Jr, Ph D Univ of Texas, Biochemical Inst, Austin *Research Assoc* (2, 1950)
- Behnke, Albert R, M S, M D Com Nav For Ger, Force Med Officer APO 403, c/o Postmaster N Y Capt, MC USA (1 1946)
- Behre, Jeanette Allen, Ph D Columbia Univ

- College of Physicians and Surgeons, Dept of Biochemistry, 630 W 168th St, New York City 32 Associate (2, 1925)
- Behrens, Otto K**, Ph D Lilly Research Labs, Eli Lilly and Co, Indianapolis 6, Ind *Head, Immuno-Chemical Research* (2, 1949)
- Behrmann, Vivian G**, Ph D Wayne Univ, Detroit, Mich *Instr, Grad School, Res Physiologist Henry Ford Hospital* (1, 1948)
- Belding, David L**, M D Boston Univ School of Medicine, Boston, Mass *Prof Emeritus of Bacteriology and Exper Pathology* (4, 1927)
- Belding, Harwood S**, Ph D QMC Climatic Research Lab, Lawrence, Mass *Director* (1, 1945)
- Belkin, Morris**, Ph D Natl Cancer Inst, Bethesda 14, Md *Sr Pharmacologist* (3, 1949)
- Bell, E T**, M D 110 Anatomy Bldg, Univ of Minnesota, Minneapolis *Prof Emeritus of Pathology* (4, 1931)
- Bender, M B**, M D New York Univ College of Medicine, New York City *Assoc Prof of Neurology and Head of Lab of Exper Medicine* (1, 1947)
- Bendich, Aaron**, Ph D Sloan-Kettering Inst for Cancer Research, 444 E 68th St, New York City 21 *Assoc, Protein-Chemistry* (2, 1950)
- Benditt, Earl P**, M D Univ of Chicago Clinics, Dept of Pathology, Chicago 37, Ill *Asst Prof* (4, 1947)
- Benedict, Francis G**, Ph D, M D Machiasport, Maine (1R, 1904, 2R, 1906)
- Benham, Olive Ray**, B S Connecticut State Dept of Health, Bureau of Labs, Hartford *Chief Serologist* (6, 1944)
- Bennett, A Lawrence**, Ph D, M D Univ of Nebraska College of Medicine, Omaha *Prof of Physiology and Pharmacology* (1, 1941)
- Bennett, Granville A**, M D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago *Prof of Pathology* (4, 1931)
- Bennett, Henry S**, M D Univ of Washington School of Medicine, Seattle *Dept of Anatomy* (1, 1946)
- Bennett, Leslie L**, M D Univ of California, Berkeley 4 *Asst Prof of Physiology* (1, 1945)
- Bennett, Mary Adelia**, Ph D Lankenau Hospital Research Inst, 7701 Burholme St Fox Chase, Philadelphia 11, Pa *Assoc Membership, Research Biochemis* (2, 1941)
- Benson, Clara C**, Ph D 160 Dorset St, West, Port Hope, Ontario, Canada *Prof Emeritus of Food Chemistry, Univ of Toronto* (2, 1906)
- Benton, Joseph G**, Ph D, M D New York Univ College of Medicine, 477 First Ave, New York City 16 *Fellow in Medicine, Research Assoc in Physical Medicine* (3, 1949)
- Benzinger, Theodore**, M D, D Sc Naval Med Research Inst, Bethesda 14, Md (1, 1950)
- Berg, Benjamin N**, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc in Pathology* (4, 1928)
- Berg, Clarence P**, Ph D State Univ of Iowa, Dept of Biochemistry, Chemistry Bldg, Iowa City *Prof of Biochemistry* (2, 1933, 5, 1936)
- Berg, William N**, Ph D 225 W 108th St, New York City *Biochemist* (2, 1906)
- Bergeim, Olaf**, Ph D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago 12 *Prof of Biochemistry* (1, 1916, 2, 1914)
- Berger, F M**, M D 7B-2 Redfield Village, Metuchen, N J *Dir, Research and Development* (3, 1949)
- Bergmann, Werner**, Ph D Yale Univ, Sterling Chemistry Lab, New Haven, Conn *Prof of Chemistry* (2, 1934)
- Berkson, Joseph**, M D, D Sc Mayo Clinic, Rochester, Minn (1, 1933)
- Berliner, Robert W**, M D 229 E 79th St, New York City 21 *Asst Prof of Medicine, Columbia Univ* (1, 1950)
- Bernard, Richard**, Ph D Laval Univ, Dept of Biology, Blvd de l'Entente, Quebec, Canada *Asst Prof of Physiology* (1, 1947)
- Bernheim, Frederick**, Ph D Box 3109, Duke Univ Med School, Durham, N C *Prof of Pharmacology* (2, 1933, 3, 1935)
- Bernthal, Theodore G**, M S, M D Med College of the State of South Carolina, Dept of Physiology, Charleston 16 *Prof of Physiology* (1, 1932)
- Berry, George Packer**, M D Harvard Med School, Boston 15, Mass *Dean and Prof of Bacteriology* (6, 1934)
- Berryman, George H**, Ph D, M D 521 Castleton Ave, Staten Island, N Y *USPHS Marine Hospital* (1, 1949)
- Bessey, Otto A**, Ph D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago 12 *Prof and Head of Dept of Biological Chemistry* (2, 1938, 5, 1943)
- Best, Charles H**, M D, D Sc Univ of Toronto, Toronto, Ontario, Canada *Dir of Banting and Best Dept of Med Research and Dept of Physiology* (1, 1923, 2, 1923)
- Bethell, Frank H**, M D 409 Lenawee Drive, Ann Arbor, Mich *Prof of Internal Medicine and Asst Dir of the Thomas Henry Simpson Memorial Inst* (4, 1936)
- Bethke, Roland M**, Ph D Ohio Agricultural Experiment Station, Wooster *In Charge of Nutritional Investigations* (2, 1928, 5, 1933)
- Beutner, R**, M D, Ph D 5380 Magnolia St, Philadelphia 44, Pa *Prof of Pharmacology Hahnemann Med College* (1R, 1924, 3, 1924)
- Beyer, Karl H**, Ph D, M D Sharp & Dohme, Inc Med Research Div, Glenolden, Pa *Dir of Pharmacological Research* (1, 1942, 3, 1944)
- Bickford, Reginald G**, M D Mayo Clinic, Sec-

- tion on Physiology, Rochester, Minn *Head of Lab of Neurophysiology and Electroencephalography* (1, 1949)
- Bier, Otto, M D Instituto Biologico, Caixa Postal 119A, São Paulo, Brazil *Head, Immunological Dept* (6, 1947)
- Bierman, Howard R, M D, Univ of California School of Medicine, San Francisco 22 *Assoc Clin Prof of Exper Oncology* (3, 1950)
- Bieter, Raymond N, M D, Ph D Univ of Minnesota, Minneapolis *Prof and Head of Dept of Pharmacology* (3, 1930)
- Bills, Charles E, Ph D 3421 Stringtown Rd Evansville 11, Ind *Independent Investigator* (2, 1928, 5, 1935)
- Bing, Franklin C, Ph D 30 W Washington St, Chicago, Ill *Consultant* (2, 1931, 5, 1934)
- Bing, Richard J, M D Johns Hopkins Hospital, Dept of Surgery, Baltimore 5, Md *Assoc Prof of Medicine and Surgery* (1, 1942)
- Binkley, Francis, Ph D Univ of Utah School of Medicine, Salt Lake City *Assoc Prof of Pathology* (2, 1947)
- Binkley, Stephen Bennett, Ph D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago *Assoc Prof of Biochemistry* (2, 1941)
- Bird, Herbert R, Ph D Bureau of Animal Industry, Agricultural Research Center, Beltsville, Md *Sr Biochemist* (5, 1947)
- Bird, Orson D, Ph D Parke, Davis and Co, Research Labs, Detroit 32, Mich *Research Biochemist* (2, 1947)
- Bird, Robert M, M D 214 E 70th St, New York City 21 *Instr in Medicine, Cornell Univ Med College, Physician to Out Patients, New York Hospital* (1, 1950)
- Birren, James E, Ph D 4006 Fordleigh Rd, Baltimore 15, Md *Psychologist, Nail Heart Inst, USPHS* (1, 1950)
- Bisbey, Bertha, Ph D Univ of Missouri, Gwynn Hall, Columbia *Prof of Nutrition* (5, 1933)
- Bischoff, Fritz E, Ph D Cottage Hospital, Santa Barbara, Calif *Dir of Research* (2, 1928, 5, 1933)
- Bishop, George H, Ph D Washington Univ Med School, Euclid and Kingshighway, St Louis, Mo *Prof of Biophysics* (1, 1923)
- Biskind, Gerson R, M D 450 Sutter St, San Francisco, Calif *Pathologist, Mt Zion Hospital, Clin Instr in Pathology, Univ of California Med School* (4, 1944)
- Black, Alex, Ph D Pennsylvania State College, Dept of Animal Nutrition, State College *Prof of Animal Nutrition* (5, 1947)
- Black, Edgar C, Ph D Univ of British Columbia, Dept of Physiology, Vancouver, B C, Canada (1, 1943)
- Black, Simon, Ph D Univ of Chicago, Chicago 37, Ill *Asst Prof of Biochemistry, Dept of Medicine* (2, 1948)
- Blair, Edgar A, Ph D Med Field Service School, Fort Sam Houston, Tex *Lt Col* (1, 1936)
- Blair, Henry A, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y. *Prof of Physiology and Dir of Dept of Radiation Biology* (1, 1934)
- Blake, Francis G, M D, Sc D Yale Univ School of Medicine, New Haven, Conn *Sterling Prof of Medicine* (4, prior to 1920, 6, 1921)
- Blake, William D, M.D Yale Univ School of Medicine, Lab of Physiology, New Haven, Conn *Instructor* (1, 1950)
- Blanchard, Ernest W, Ph D Schieffelin and Co, 30 Cooper Sq New York City 3 *Dir of Research* (1, 1946)
- Blankenhorn, M A, M.D Univ of Cincinnati, Cincinnati, Ohio *Prof of Medicine* (4, 1932)
- Blatherwick, Norman R, Ph D Metropolitan Life Insurance Co, 1 Madison Ave, New York City *Dir of Biochemical Lab* (1, 1915, 2, 1915, 5, 1934)
- Blau, Nathan F, Ph D Veterans Admin Hospital, 401 S Holyoke Ave, Wichita 8, Kan *Research Biochemist* (2, 1928)
- Blish, Morris J, Ph D Internatl Minerals and Chemical Corp, Box G, Rossford, Ohio *Research Dir* (2, 1944)
- Bliss, Alfred, Ph D Tufts College Med School, Boston, Mass *Assoc Prof of Physiology* (1, 1947)
- Bliss, Chester Ittner, Ph D Conn Agricultural Exper Station, P O Box 1106, New Haven *Biometrician, Lecturer in Biometry, Yale Univ* (3, 1944)
- Bliss, Eleanor A, Sc D Johns Hopkins Hospital, Dept of Preventive Medicine, 615 N Wolfe St, Baltimore, Md *Assoc in Preventive Medicine, Johns Hopkins Univ School of Medicine* (6, 1931)
- Bloch, Konrad, Ph.D Univ of Chicago, Dept of Biochemistry, Chicago 37, Ill *Professor* (2, 1944)
- Block, Richard J, Ph D 15 Cooper Rd, Scarsdale, N Y *Dir Of Research, C M Armstrong Co, Assoc Dept of Physiology and Biochemistry, New York Med College, Flower and Fifth Ave Hospital* (2, 1934, 5, 1933)
- Block, Walter D, Ph D 813 E McCreight Ave, Springfield, Ohio, (2, 1942)
- Blood, Frank R, Ph D Vanderbilt Univ, Dept of Biochemistry, Nashville 4, Tenn *Professor* (1, 1950)
- Bloom, William, M D 1419 E 56th St, Chicago, Ill *Prof of Anatomy, Univ of Chicago* (4, 1930)
- Bloomfield, A L, M D Stanford Univ Hospital, San Francisco, Calif *Prof of Medicine* (3, 1927, 4, 1927)

- Bloor, W R, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester 20, N Y *Prof of Biochemistry* (1R, 1915, 2, 1910)
- Blum, Harold F, Ph D Princeton Univ, Dept of Biology, Princeton, N J *Physiologist, Natl Cancer Inst, and Visiting Lecturer* (1, 1928)
- Blumberg, Harold, Sc D Endo Products, Inc, 84-40 101st St, Richmond Hill 18, N Y *Head of Biological Labs* (5, 1942)
- Blumenstock, Julius, M D Veterans Admin Hospital, Sheridan, Wyo (1, 1925)
- Blumgart, Herrmann L, M D Beth Israel Hospital, 330 Brookline Ave, Boston, Mass *Physician in Chief, Prof of Medicine, Harvard Med School* (1, 1927)
- Blunt, Katharine, Ph D 38 Glenwood Ave, New London, Conn *Pres Emeritus, Connecticut College for Women* (2, 1921)
- Bobb, J Richard R, M D Temple Univ Med School, Dept of Pharmacology, Philadelphia, Pa *Asst Prof* (1, 1949)
- Bock, Joseph C, Ph D 2324 N 46th St, Milwaukee 10, Wis *Prof Emeritus of Biochemistry, Marquette Univ Med School, Biochemist, Milwaukee County Hospital* (2, 1916)
- Bodansky, Aaron, Ph D Hospital for Joint Diseases, 1919 Madison Ave, New York City *Biological Chemist* (2, 1926)
- Bodansky, Oscar, Ph D, M D Memorial Hospital Cancer Center, 444 E 68th St, New York City 21 *Chief, Clin Biochemistry, Assoc Prof of Clin Pharmacology, Cornell Med College* (2, 1937, 3, 1942)
- Bodian, David, Ph D, M D Johns Hopkins Univ, 1901 E Madison St, Baltimore, Md *Assoc Prof of Epidemiology* (6, 1949)
- Bodine, Joseph Hall, Ph D State Univ of Iowa, Iowa City *Prof and Head of Dept of Zoology* (1, 1925)
- Boell, Edgar J, Ph D Yale Univ, Osborn Zoological Lab, New Haven, Conn *Ross G Harrison Prof of Exper Zoology* (1, 1942)
- Boettiger, Edward G, Ph D Univ of Connecticut, Box U-42, Storrs *Asst Prof of Zoology* (1, 1950)
- Boger, William P, M D Univ of Pennsylvania Hospital, Rm 715, Pepper Lab, Philadelphia *Instr in Medicine* (3, 1948)
- Bogert, L Jean, Ph D Hotel Claremont, Berkeley, Calif (2, 1917)
- Bogert, Marston Taylor, Sc D 1158 Fifth Ave, New York City 29 *Prof Emeritus of Organic Chemistry, Columbia Univ, Scientific Consultant to Eians Research and Development Corp* (2, 1925)
- Bohr, David F, M D Univ of Michigan, Physiology Lab, Ann Arbor *Assoc Prof* (1, 1949)
- Bolliger, Adolph, Ph D Univ of Sydney, Gordon Craig Research Lab., Sydney, Australia *Dir of Research* (2, 1928)
- Bollman, J L, M D Mayo Clinic, Rochester, Minn *Chairman of Div of Exper Medicine, Prof of Physiology, Mayo Foundation* (4, 1927)
- Bond, Glenn C, Ph D, M D The Upjohn Co, Research Lab, Kalamazoo, Mich *Asst Dept Head of Bacteriology Research* (6, 1939)
- Bondi, Amedeo Hahnemann Med College, Philadelphia, Pa *Prof and Head of Dept of Bacteriology* (6, 1948)
- Bonner, David M, Ph D Yale Univ, Osborn Botanical Lab, New Haven, Conn *Assoc Prof and Research Assoc* (2, 1948)
- Bonnycastle, Desmond D, M D, Ph D Yale Univ School of Medicine, New Haven, Conn *Asst Prof of Pharmacology* (3, 1947)
- Bonsnes, Roy W, Ph D Cornell Univ Med College, 1300 York Ave, New York City 21 *Assoc Prof of Biochemistry in Obstetrics* (2, 1947)
- Booher, Lela E, Ph D General Mills, Inc, 1081 21st Ave, S E, Minneapolis, Minn *Chief Nutritionist and Dir of Nutrition Lab* (2, 1933, 5, 1933)
- Booker, Walter M, Ph D Howard Univ School of Medicine, Washington, D C *Assoc Prof of Pharmacology* (1, 1948, 3, 1948)
- Boor, Alden K, Ph D Camp Detrick, Basic Science Div, Frederick, Md (2, 1931)
- Boothby, Walter M, M A, M D Univ of Malaya, Dept of Physiology, Singapore *Visiting Prof, Chief Emeritus, Clin Metabolism Sect, Mayo Clinic* (1R, 1915, 2, 1920, 3R, 1923, 4R, 1924)
- Bordley, James, III, M D Mary Imogene Bassett Hospital, Cooperstown, N Y (1, 1938)
- Borek, Ernest, Ph D College of the City of New York, Convent Ave and 140th St, New York City *Asst Prof, Research Assoc in Biochemistry, Columbia Univ* (2, 1947)
- Borison, Herbert Leon, M S, Ph D Univ of Utah, College of Medicine, Dept of Pharmacology, Salt Lake City *Instructor* (1, 1950)
- Boroff, Daniel A, M A, M S % L J Kuhne, 502 Rugby Rd, Brooklyn, N Y (6, 1947)
- Borsook, Henry, M D, Ph D California Inst of Technology, Pasadena 4 *Prof of Biochemistry* (2, 1931)
- Bosshardt, David K, Ph D Sharp & Dohme, Med Research Div, Glenolden, Pa *Research Biochemist* (5, 1947)
- Bostick, Warren L, M D Univ of California Med School, Dept of Pathology, San Francisco 22 *Asst Prof* (4, 1949)
- Bosworth, Alfred Willson, A M, M D R F D 4, Circleville, Ohio *Consulting Chemist* (2, 1936, 5R, 1935)
- Bott, Phyllis A, Ph D Woman's Med College of Pennsylvania, Henry Ave and Abbotsford Rd,

- Philadelphia *Prof and Chairman of Dept of Physiological Chemistry* (2, 1938)
- Boucher, Robert V**, Ph D 303 Frear Labs, State College, Pa *Prof of Agricultural and Biological Chemistry* (5, 1945)
- Bouman, H D**, M D Univ of Wisconsin Med School, Madison *Prof of Physical Medicine* (1, 1943)
- Bourne, Wesley, M D**, M Sc McGill Univ, Montreal, Quebec, Canada *Prof and Chairman, Dept of Anesthesiology* (3, 1936)
- Bourque, Joseph E**, M D, Ph D Univ of Illinois College of Medicine, Dept of Physiology, 1853 W Polk St, Chicago 12 *Asst Prof* (1, 1949)
- Bourquin, Helen**, Ph D 1331 N Tejon St, Colorado Springs, Colo (1, 1925)
- Bowen, William J**, Ph D USPHS, Inst of Exper Biology & Medicine, Bethesda 14, Md *Sr Asst Scientist* (1, 1948)
- Bowman, Donald E**, Ph D 6956 Warwick Rd, Indianapolis, Ind *Assoc Prof of Biochemistry, Indiana Univ School of Medicine* (2, 1944)
- Bowman, Katherine L**, B A 20 Plaza St, Brooklyn 17, N Y *Research Fellow in Allergy, Jewish Hospital, Brooklyn* (6, 1946)
- Boxer, George E**, Ph D 318 Temple Pl, Westfield, N J *Sr Chemist, Research and Development Div, Merck & Co, Inc* (2, 1946)
- Boyd, Eldon M**, M A, M D Queen's Univ, Kingston, Ontario, Canada *Prof and Head of Dept of Pharmacology* (3, 1941)
- Boyd, Linn J**, M D New York Med College and Flower & Fifth Ave Hospitals, 1 E 105th St, New York City 29 *Prof of Pharmacology, Div of Medicine* (3, 1950)
- Boyd, M John**, Ph D Hahnemann Med College, 235 N 15th St, Philadelphia 2, Pa *Prof of Biol Chemistry* (2, 1947)
- Boyd, T E**, Ph D 9 Walworth Ave, Scarsdale, N Y *Assoc Dir of Research, Natl Found for Infantile Paralysis, 120 Broadway, New York City 5* (1, 1924)
- Boyd, William C**, Ph D U S Naval Med Research Unit #3, % American Embassy, Cairo, Egypt (6, 1933)
- Boyden, Allan A** Rutgers Univ, New Brunswick, N J *Prof of Zoology* (6, 1948)
- Boyden, Edward A**, Ph D Univ of Minnesota, Minneapolis 14 *Prof and Chairman of Dept of Anatomy* (1, 1929)
- Boyer, Paul D**, Ph D Univ of Minnesota College of Agriculture, Div of Biochemistry, St Paul 1 *Assoc Prof* (2, 1944)
- Boyle, Paul E**, D M D Univ of Pennsylvania School of Dentistry, 40th and Spruce Sts, Philadelphia 4 *Prof of Oral Pathology* (4, 1939)
- Bozicevich, John**, M A USPHS, Natl Insts of Health, Bethesda, Md *Head, Subsection of Immunology, Trop Diseases Div* (6, 1948)
- Bozler, Emil**, Ph D Ohio State Univ, Columbus *Prof of Physiology* (1, 1932)
- Bradbury, James T**, Sc D Univ of Louisville School of Medicine, 101 W Chestnut St, Louisville 2, Ky (1, 1941)
- Bradley, Harold C**, Ph D 2639 Durant Ave, Berkeley, Calif (1, 1911, 2, 1908)
- Bradley, Stanley E**, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc Prof of Medicine* (1, 1947)
- Bradley, William B**, Ph D American Inst of Baking, 1046 Elmwood Ave, Wilmette, Ill *Dir of Labs* (1, 1939)
- Bragdon, Joseph Henry**, M D Natl Insts of Health, Exper Biology and Medicine Inst, Pathology Lab, Bethesda 14, Md *Surgeon (R) USPHS* (4, 1950)
- Branch, E Arnold G**, M D Lancaster Hospital, St John, New Brunswick, Canada *Dir of Labs* (4, 1929)
- Brand, Erwin**, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc Prof of Biological Chemistry* (2, 1929)
- Brandes, W W**, M D Roosevelt Hospital, W 59th St, New York City (4, 1931)
- Branham, Sara E**, Ph D, M D, Natl Insts of Health, Bethesda, Md *Sr Bacteriologist* (6, 1926)
- Bramon, Hugh Douglas**, Ph D Ontario Agricultural College, Guelph, Canada *Prof and Head of Dept of Animal Nutrition* (5, 1933)
- Brassfield, Charles R**, Ph D Univ of Michigan, Ann Arbor *Assoc Prof of Physiology* (1, 1937)
- Bratton, Andrew Calvin, Jr**, M D, Ph D Parke Davis and Co, Research Labs, Detroit 32, Mich *Dir of Pharmacological Research* (3, 1941)
- Brauer, Ralph W**, Ph D Louisiana State Univ School of Medicine, New Orleans *Asst Prof of Pharmacology* (3, 1948)
- Braun, Herbert A**, Ph D Fed Security Agency, Food and Drug Admin, Washington, D C *Pharmacologist* (3, 1941)
- Brazier, Mary A B**, Ph D Massachusetts General Hospital, Electroencephalographic Lab, Boston 14 *Research Assoc in Neuropathology, Harvard Med School* (1, 1947)
- Brecher, George**, M D Natl Insts of Health, Pathology and Pharmacology Lab, Bethesda 14, Md (4, 1949)
- Brecher, Gerhard A**, M D, Ph D Western Reserve Univ Med School, Dept of Physiology, Cleveland 6, Ohio *Sr Instructor* (1, 1949)
- Breedis, Charles**, M D Univ of Pennsylvania School of Medicine, Philadelphia *Instr in Pathology* (4, 1948)

- Brewer, Carl R , Ph D Camp Detrick, Frederick, Md *Chief, Bacterial Nutrition Branch, Biological Div , Chemical Corps* (2, 1948)
- Brewer, John H , Ph D Hynson Westcott and Dunning, Baltimore, Md *Dir of Biological Research* (6, 1948)
- Brewer, Nathan R , Ph D Univ of Chicago, Chicago, Ill *Lecturer in Physiology* (1, 1948)
- Bridge, Edward M , M D Univ of Buffalo School of Medicine, 24 High St , Buffalo 9, N Y *Prof of Pharmacology* (2, 1940)
- Briggs, A P , M D Univ of Georgia Med College, Augusta *Prof of Biochemistry* (2, 1923)
- Briggs, David R , Ph D Univ of Minnesota, Div of Agricultural Biochemistry, Univ Farm, St Paul 8 *Prof of Agricultural Biochemistry, Chemist, Minn Agricultural Exper Station* (2, 1946)
- Briggs, George M , Ph D Univ of Minnesota, Univ Farm, St Paul *Asst Prof of Poultry Nutrition* (5, 1947)
- Brink, Frank Jr , Ph D Johns Hopkins Univ , Biological Labs , Baltimore 18, Md (1, 1942)
- Brinkhous, K M , M D Univ of North Carolina School of Medicine, Dept of Pathology, Chapel Hill *Prof of Pathology* (4, 1939)
- Britton, Sydney W , M D Univ of Virginia School of Medicine, Charlottesville *Prof of Physiology* (1, 1925)
- Brobeck, John R , M D , Ph D Yale Univ School of Medicine, New Haven, Conn *Asst Prof of Physiology* (1, 1943)
- Brodie, Bernard B , Ph D Natl Insts of Health, Natl Heart Inst , Bethesda 14, Md *Chief, Section on Chemical Pharmacology* (2, 1940, 3, 1945)
- Brody, Samuel, Ph D Univ of Missouri College of Agriculture and Agricultural Experiment Station, Dairy Building, Columbia *Prof of Dairy Husbandry* (2, 1929, 5, 1933)
- Broh-Kahn, Robert H , M D Bristol Labs , Inc , P O Box 657, Syracuse, N Y (1, 1948)
- Bromuley, Reginald B , Ph D Johns Hopkins School of Medicine, Dept of Physiology, 710 N Washington St , Baltimore 5, Md *Prof of Physiology* (1, 1949)
- Bronfenbrenner, J J , Ph D , D P H Washington Univ School of Medicine, St Louis, Mo *Prof of Bacteriology and Immunology* (4, 1940, 6, 1918)
- Bronk, Detlev W , Ph D , Sc D Johns Hopkins Univ , Baltimore, Md *Pres , Chairman of Natl Research Council* (1, 1927)
- Brookes, Margaret C Hessler, Ph D Univ of Chicago, Chicago, Ill *Asst Prof , Dept of Home Economics* (5, 1935)
- Brookhart, John M , Ph D Univ of Oregon School of Medicine, Dept of Physiology, Portland *Assoc Prof* (1, 1946)
- Brooks, Chandler McCuskey, Ph D State Univ of New York Med Center at New York, College of Medicine, 350 Henry St , Brooklyn 2 *Prof of Physiology and Pharmacology, Exec Officer of Dept* (1, 1934, 3, 1950)
- Brooks, Clyde, Ph D , M D Univ Clinic, 2508 Ponce de Leon Blvd , Coral Gables, Fla *Internal Medicine* (1, 1910, 3, 1912)
- Brooks, Matilda Moldenhauer, Ph D Univ of California, Dept of Physiology, Berkeley *Research Assoc in Biology* (1, 1923)
- Broun, Goronwy Owen, M D 1325 S Grand Blvd , St Louis, Mo *Prof of Internal Medicine, St Louis Univ* (4, 1927)
- Brown, Claude P , M D 1930 Chestnut St , Philadelphia, Pa *Practicing Clin Pathologist* (6, 1913)
- Brown, Dugald E S , Ph D Bermuda Biological Station, St George's W , Bermuda (1, 1932)
- Brown, Edgar D , Pharm D , M D Paynesville, Minn *Retired* (1R, 1907, 3R, 1909)
- Brown, Ernest B , Jr , M S , Ph D Univ of Minnesota, Dept of Physiology, Minneapolis *Asst Prof* (1, 1950)
- Brown, Ethan Allen, L R C P (Eng) , A R C S (London), 75 Bay State Rd , Boston, Mass *Lecturer in Medicine, Tufts College Med School, Physician-in-Chief, Allergy Clinic, Boston Dispensary* (6, 1946)
- Brown, Frank A , Jr , Ph D Northwestern Univ , Zoological Labs , Evanston, Ill *Assoc Prof of Zoology* (1, 1940)
- Brown, George B , Ph D Sloan-Kettering Inst for Cancer Research, 444 E 68th St , New York City 21 *Member, Assoc Prof of Biochemistry, Cornell Univ Med College* (2, 1947)
- Brown, Gordon Campbell, Sc D School of Public Health, Ann Arbor, Mich *Assoc Prof of Epidemiology* (6, 1949)
- Brown, John B , Ph D Ohio State Univ , Columbus *Prof of Physiological Chemistry* (2, 1927, 5, 1934)
- Brown, R A , Ph D Parke Davis and Co , Research Labs , Detroit 32, Mich *Head of Div of Nutritional Research* (5, 1946)
- Brown, Rachel, Ph D 26 Buckingham Drive, Albany, N Y *Sr Biochemist, Div of Labs and Research, N Y State Dept of Health* (6, 1933)
- Brown, Robert V , Ph D Univ of Tennessee, Dept of Pharmacology, Memphis 3 *Assoc Prof* (1, 1945, 3, 1950)
- Browne, J S L , M D , Ph D Royal Victoria Hospital, Univ Clinic, Montreal, Que , Canada *Asst Prof of Medicine, McGill Univ* (1, 1934)
- Brownell, Katharine A , Ph D Ohio State Univ , Dept of Physiology, Columbus *Research Assoc* (1, 1943)
- Brozek, Josef, Ph D Univ of Minnesota, Stadium South Tower, Minneapolis 14 *Assoc Prof , Lab of Physiological Hygiene, School of Public Health* (1, 1947)

- Brues, Austin M**, M D Argonne National Labs, P O Box 5207, Chicago, Ill *Dir of Biology Div, Assoc Prof of Medicine and Instr of Radiobiology and Biophysics, Univ of Chicago* (1, 1940)
- Bruesch, S R**, M D, Ph D Univ of Tennessee, Div of Anatomy, Memphis 3 *Prof of Anatomy* (1, 1949)
- Bruger, Maurice**, M D, M Sc 301 E 20th St, New York City 3 *Assoc Prof of Medicine, New York Univ Post-Grad Med School, Chief, Div of Pathological Chemistry, New York University Hospital* (2, 1935, 5, 1935)
- Bruhn, John M**, Ph D Med College of Alabama, Dept of Physiology, 620 S 20th St, Birmingham 5 *Prof of Physiology and Pharmacology* (1, 1939)
- Bruner, Harry Davis**, M D, Ph D Med Div ORINS, Box 117, Oak Ridge, Tenn *Principal Scientist* (3, 1945)
- Brunschwig, Alexander**, M D Cornell Univ Med College, New York City *Prof of Clin Surgery, Attending Surgeon, Memorial Hosp* (4, 1937)
- Bryan, W Ray**, Ph D 4405 Bywood Lane, Bethesda, Md *Principal Biologist, Natl Cancer Inst* (1, 1934, 4, 1940)
- Buchanan, J William**, Ph D Univ of Southern California, Alan Hancock Foundation, Los Angeles *Prof of Zoology* (1, 1927)
- Buchanan, John M**, Ph D Univ of Pennsylvania School of Medicine, Dept of Physiological Chemistry, Philadelphia *Assoc Prof* (2, 1949)
- Buchbinder, Lean**, Ph D Dept of Health, 125 Worth St, New York City *Sr Bacteriologist in charge of Lab* (6, 1934)
- Buchbinder, William C**, M D 104 S Michigan Ave, Chicago, Ill *Asst Prof of Medicine, Northwestern Univ Med School, Assoc in Medicine, Michael Reese Hospital* (1, 1940)
- Bucher, Gladys R**, Ph D Univ of Illinois, Dept of Biology, Chicago Div, Navy Pier, Chicago 12 (1, 1946)
- Buckner, G Davis**, Ph D Kentucky Agricultural Exper Station, Lexington *In charge of Animal Nutrition* (2, 1920)
- Bucy, Paul C**, M D 4833 S Woodlawn Ave, Chicago, Ill *Prof of Neurology and Neurological Surgery, Univ of Illinois* (1, 1933)
- Buddingh, G John**, M D Louisiana State Univ School of Medicine, New Orleans *Prof of Microbiology* (4, 1940)
- Bueding, Ernest**, M D Western Reserve Univ School of Medicine, Dept of Pharmacology, Cleveland 6, Ohio *Assoc Prof* (2, 1946, 3, 1949)
- Buell, Mary V**, Ph D Washington Univ School of Medicine, Euclid Ave and Kingshighway, St Louis 10, Mo *Research Asst, Dept of Biological Chemistry* (2, 1921)
- Bugher, John C**, M D The Rockefeller Foundation, 49 W 49th St, New York City 21 *Member, Internatl Health Div* (4, 1935)
- Bukantz, Samuel C**, M D Washington Univ School of Medicine, St Louis 10, Mo *Research Asst in Medicine* (6, 1943)
- Bulatao, Emilio**, M D Univ of the Philippines, Manila, P I *Prof of Physiology and Biochemistry* (1, 1924)
- Bull, Henry B**, Ph D Northwestern Univ Med School, 303 E Chicago Ave, Chicago 11, Ill *Prof of Chemistry* (2, 1937)
- Bullock, Theodore H**, Ph D Univ of California, Los Angeles *Assoc Prof of Zoology* (1, 1948)
- Bunde, Carl A**, M D, Ph D Pitman-Moore Co, Indianapolis 6, Ind *Research Dir* (1, 1943)
- Bunney, William Edward**, Ph D E R Squibb and Sons, New Brunswick, N J *Vice Pres, Dir of Manufacturing Labs* (6, 1931)
- Bunting, Charles H**, M D 139 Armory St, Hamden, Conn *Prof Emeritus of Pathology, Univ of Wisconsin, Lecturer in Pathology, Yale Med School* (4, 1913)
- Bunzell, H H**, Ph D Box 44, General Post Office, New York City 1 *Dir of Bunzell Labs* (2, 1908)
- Burchell, Howard B**, M D, Ph D 1506 Durand Court, Rochester, Minn *Instr in Medicine, Mayo Foundation, Consultant in Medicine, Mayo Clinic* (1, 1942)
- Burdick, H O**, Sc D Alfred Univ, Alfred, N Y *Prof of Biology* (1, 1940)
- Burdon, Kenneth L**, Ph D Baylor Univ College of Medicine, Houston, Tex *Prof of Bacteriology, Consultant, USPHS* (6, 1936)
- Burgen, A S V**, M B, MRCP McGill Univ, Dept of Physiology, Montreal, Quebec, Canada *Professor* (1, 1950, 3, 1950)
- Burk, Dean**, Ph D Natl Cancer Inst, Bethesda, Md *Principal Biochemist, USPHS* (2, 1939)
- Burns, Edward L**, M D Mercy Hospital, Toledo, Ohio *Pathologist* (4, 1939)
- Burr, George O**, Ph.D Exper Station H S P A, Honolulu, Hawaii *Head of Dept of Biochemistry and Physiology* (2, 1928, 5, 1933)
- Burris, Robert H**, Ph D Univ of Wisconsin, Dept of Biochemistry, Madison 6 *Prof of Biochemistry* (2, 1946)
- Burrows, William**, Ph D Univ of Chicago, Dept of Bacteriology and Parasitology, Chicago 37, Ill *Prof of Bacteriology* (6, 1947)
- Burton, Alan C**, Ph D Univ of Western Ontario, Dept of Med Research, London, Ontario, Canada *Asst Prof* (1, 1937)
- Burton-Opitz, Russell**, M D, Ph D 218 Bridle Way, Palisade, N J *Attending Cardiologist, Lenox Hill Hospital, Attending Physician, Cumberland Hospital* (1R, 1902, 2, 1906, 3R, 1919)
- Buschke, William H**, M D Manhattan Eye, Ear and Throat Hospital, 210 E 64th St, New York

- City 21 *Research Ophthalmologist, Head of Ayer Foundation Ophthalmic Research Lab* (1, 1947)
- Bush, Milton T, Ph D Vanderbilt Univ School of Medicine, Nashville, Tenn *Assoc Prof of Pharmacology* (3, 1938)
- Butler, G C, Ph D Univ of Toronto, Dept of Biochemistry, Toronto, Ont, Canada *Assoc Prof* (2, 1949)
- Butler, Thomas C, M D Univ of North Carolina School of Med, Chapel Hill *Prof of Pharmacology* (3, 1938)
- Butt, Hugh R, M D Mayo Clinic, 102 Second Ave, S W, Rochester, Minn *Consultant in Medicine, Asst Prof of Medicine, Mayo Foundation* (5, 1942)
- Butts, Joseph S, Ph D Oregon State College, Corvallis *Prof of Biochemistry and Head of Agricultural Chemistry* (2, 1936, 5, 1936)
- Byers, Sanford O, Ph D 2200 Post St, San Francisco 15, Calif *Research Biochemist, Harold Brunn Inst for Cardiovascular Research, Mount Zion Hospital* (1, 1949)
- Cahen, Raymond L, Ph D, M D Maltbie Chemical Co, Research Labs, P O Box 270, Morristown, N J *Dir of Pharmacological Research* (3, 1949)
- Cahill, William M, Ph D, M D 3320 Baldwin St, Los Angeles 31, Calif (2, 1940)
- Cajori, Florian A, Ph D Univ of Colorado Med School, Denver 7 *Asst Prof of Biochemistry* (2, 1922, 5, 1933)
- Caldwell, Mary L, Ph D Columbia Univ, New York City *Prof of Chemistry* (2, 1924, 5, 1933)
- Callison, Elizabeth C, M S U S Dept of Agriculture, Agricultural Research Station, Food and Nutrition Div, Bureau of Human Nutrition, Beltsville Md *Nutrition Physiologist* (5, 1949)
- Calloway, Nathaniel Oglesby, Ph D, M D Univ of Illinois College of Medicine, 1819 W Polk St, Chicago 12 *Asst in Medicine* (3, 1945)
- Calvin, D Bailey, Ph D Univ of Texas Med Branch, Galveston *Prof of Biological Chemistry and Dean of Student and Curricular Affairs* (1, 1934, 2, 1939)
- Calvin, Melvin, Ph D Univ of California, Berkeley 4 *Prof of Chemistry* (2, 1949)
- Campanopetros, John, M D Hellenic Pasteur Inst, 103 Queen Sophie Ave, Athens, Greece *Chief of the Service of Exper Medicine* (6, 1946)
- Camp, Walter J R, M D, Ph D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago, Ill *Prof of Pharmacology and Toxicology, State Toxicologist* (3, 1926)
- Campbell, Berry, Ph D Univ of Minnesota, Minneapolis 14 *Assoc Prof of Anatomy* (1, 1945)
- Campbell, Dan H, Ph D California Inst of Technology, Pasadena *Assoc Prof of Chemistry* (6, 1938)
- Campbell, H Louise, Ph D 900 Windsor Ave, Windsor, Conn (5R, 1933)
- Campbell, J Alexander, Ph D Dept of Natl Health and Welfare, Food and Drug Div, Ottawa, Ont, Canada *Chief, Vitamin and Nutrition Lab* (5, 1950)
- Campbell, James, Ph D Univ of Toronto, Toronto, Ont, Canada *Assoc Prof of Physiology, Lt Comdr, (S B) R C N V R* (1, 1943)
- Campbell, Walter Ruggles, M D Univ of Toronto, 69 Madison Ave, Toronto, Ont, Canada *Assoc Prof of Medicine* (2, 1922)
- Cannan, R Keith, D Sc New York Univ College of Medicine, 477 First Ave, New York City *Prof of Chemistry* (2, 1931)
- Cannon, Paul R, M D, Ph D Univ of Chicago, Chicago, Ill *Prof of Pathology* (4, 1930, 6, 1929)
- Cantarow, Abraham, M D Jefferson Med College, Philadelphia 7, Pa *Prof of Biochemistry* (1, 1932, 3, 1935)
- Cantoni, G L, M D New York Univ College of Medicine, Dept of Pharmacology, New York City *Fellow of the American Cancer Society* (3, 1945)
- Canzanelli, Attilio, M D Tufts College Med School, 136 Harrison Ave, Boston, Mass *Prof of Exper Physiology* (1, 1934)
- Carlson, A J, Ph D, M D Univ of Chicago, Hull Physiological Lab, Chicago, Ill *Prof Emeritus of Physiology* (1, 1904, 5, 1933)
- Carlson, Loren D, Ph D Univ of Washington School of Medicine, Dept of Physiology and Biophysics, Seattle 5 (1, 1945)
- Carmichael, Emmett B, Ph D Med College of Alabama, Dept of Biochemistry, Birmingham 5 *Prof and Head of Dept* (1, 1931, 2, 1946)
- Carmichael, Leonard, Ph D Sc D Tufts College, Medford, Mass *Pres, Dir of Research Lab of Sensory Psychology and Physiology* (1, 1937)
- Carpenter, Frederick H, Ph D Univ of California, Dept of Biochemistry, Berkeley 4 *Asst Prof* (2, 1949)
- Carpenter, Thorne M, Ph D 27 Market St, Foxboro, Mass (1R, 1915, 2, 1909, 5R, 1935)
- Carr, C Jelleff, Ph D Univ of Maryland School of Medicine, Baltimore *Assoc Prof of Pharmacology* (3, 1940)
- Carr, Jesse L, M D Univ of California Med School, Third and Parnassus Aves, San Francisco *Chn Prof of Pathology* (4, 1940)
- Carruthers, Christopher, Ph D Washington Univ School of Medicine, Dept of Anatomy, 4580 Scott Ave, St Louis 10, Mo *Research Assoc* (2, 1948)
- Carter, Charles E, M D Western Reserve Univ School of Medicine, Cleveland 6, Ohio *Dept of Medicine* (2, 1950)
- Carter, Herbert E, Ph D Univ of Illinois, 452

- Noyes Lab , Urbana *Prof of Biochemistry* (2, 1937, 5, 1941)
- Cartland, George F** , Ph D The Upjohn Co , Research Dept , Kalamazoo, Mich *Head of Antibiotics Research* (2, 1936)
- Cary, Charles A** , S B U S Dept of Agriculture, Bureau of Dairy Industry, Dairy Research Lab , Beltsville, Md *Chief of Div of Nutrition and Physiology* (2, 1920)
- Casey, Albert Eugene**, M D 1907 Wellington Rd , Birmingham 9, Ala *Pathologist, Baptist Hospital, Assoc Prof of Pathology, Med College of Alabama* (4, 1933)
- Cash, James Robert**, M D Univ Hospital, Charlottesville, Va *Prof of Pathology, Univ of Virginia* (4, 1924)
- Cassidy, Harold G** , Ph D Yale Univ , Sterling Chemical Lab , New Haven, Conn *Assoc Prof of Chemistry* (2, 1949)
- Castillo, Julio C** , B S Wellcome Research Labs , Tuckahoe, N Y *Pharmacologist* (3, 1950)
- Castle, Edward S** , Ph D Harvard Univ Biological Labs , Divinity Ave , Cambridge, Mass *Assoc Prof of General Physiology* (1, 1934)
- Castle, William B** , M D Boston City Hospital, Boston, Mass *Prof of Medicine, Harvard Med School, Dir of Thorndike Memorial Lab* (4, 1942)
- Catchpole, Hubert Ralph**, Ph D Univ of Illinois College of Medicine, 1853 W Polk St , Chicago 12, Ill *Research Assoc in Pathology* (1, 1941)
- Cathcart, E P** , M D , D Sc Univ of Glasgow, Glasgow, Scotland *Dean of Univ* (5R, 1935)
- Catron, Lloyd**, M D City Hospital, Akron, Ohio *Pathologist* (4, 1939)
- Cattell, McKeen**, Ph D , M D Cornell Univ Med College, 1300 York Ave , New York City *Prof of Pharmacology* (1, 1923, 3, 1924)
- Cavelti, Philip A** , M D 11406 Kingsland St , Los Angeles, Calif (6, 1947)
- Cederquist, Dena C** , Ph D Michigan State College, School of Home Economics, East Lansing *Assoc Prof (Research) of Foods and Nutrition* (5, 1949)
- Ceithaml, Joseph H** , Ph D Univ of Chicago, 947 E 58th St , Chicago 37, Ill *Asst Prof of Biochemistry* (2, 1950)
- Cerecedo, Leopold R** , Ph D Fordham Univ , New York City *Prof of Biochemistry* (2, 1931, 5, 1945)
- Chadwick, Leigh Edward**, Ph D Med Div , Army Chemical Center, Md (1, 1944)
- Chaikoff, I L** , Ph D , M D Univ of California, Berkeley *Assoc Prof of Physiology* (1, 1932)
- Chalkley, Harold W** , Ph D USPHS, Natl Insts of Health, Bethesda, Md *Sr Physiologist* (1, 1932)
- Chamberlain, W Edward**, M D Temple Univ Med School, Philadelphia, Pa *Prof of Radiology* (1, 1948)
- Chambers, Alfred H** , Ph D Univ of Vermont School of Medicine, Dept of Physiology, Burlington (1, 1946)
- Chambers, Leslie Addison**, Ph D Camp Detrick, Frederick, Md *Chief of Physical and Chemical Div* (1, 1940, 6, 1948)
- Chambers, Robert**, Ph D New York Univ , Washington Sq , New York City *Research Prof Emeritus of Biology, N Y U* (1R, 1932)
- Chambers, William H** , Ph D Med Div , Army Chemical Center, Md *Chief of Toxicology Branch* (1, 1924, 5, 1933)
- Chambers, W W** , Ph D Univ of Pennsylvania, School of Medicine, Dept of Anatomy, Philadelphia 4 *Asst Prof* (1, 1950)
- Chance, Britton**, M S , Ph D Univ of Pennsylvania, Johnson Research Found , 612 Maloney Bldg , Philadelphia 4 *Prof and Dir of Johnson Research Foundation* (1, 1950, 2, 1950)
- Chandler, Caroline A** , M D Johns Hopkins School of Hygiene and Public Health, 615 N Wolfe St , Baltimore 5, Md *Asst Prof of Preventive Medicine* (6, 1938)
- Chandler, Joseph P** , Ph D Univ of Michigan Med School, Room G455, Univ Hosp , Ann Arbor *Asst Prof of Biological Chemistry, Biochemist, Univ Hosp* (2, 1944, 5, 1944)
- Chang, Min Cheuh**, Ph D Worcester Foundation, Shrewsbury, Mass *Assoc Fellow* (1, 1946)
- Chanutin, Alfred**, Ph D Box 1862, University Station, Charlottesville, Va *Prof of Biochemistry, Univ of Virginia* (2, 1925)
- Chapanis, Alphonse**, Ph D Johns Hopkins Univ , Baltimore, Md *Asst Prof of Psychology* (1, 1948)
- Chapman, C W** , Ph D Univ of Maryland, Baltimore *Prof of Pharmacology* (3, 1932)
- Chargaff, Erwin**, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St , New York City 32 *Assoc Prof of Biological Chemistry* (2, 1935)
- Charipper, Harry Adolph**, Ph D Washington Square College of Arts and Sciences, 100 Washington Square E , New York City *Prof and Chairman of Dept of Biology* (1, 1941)
- Chase, Aurin M** , Ph D Princeton Univ , Dept of Biology, Princeton, N J *Research Assoc, Asst Prof* (1, 1939)
- Chase, Harold F** , M D Univ of Virginia Hospital, Charlottesville *Dir and Assoc Prof of Anesthesiology* (3, 1944)
- Chase, Merrill W** , Ph D Rockefeller Inst , 66th St and York Ave , New York City *Member of Staff* (6, 1938)
- Chasis, Herbert**, M D , Med Sc D 44 E 67th St , New York City *Asst Prof of Medicine, New York Univ College of Medicine* (1, 1941)
- Chatfield, Charlotte**, B S Food and Agriculture

- Organization of the United Nations, Washington, D C *Nutrition Officer* (5, 1941)
- Chatfield, Paul Oakes, M D Harvard Med School, Dept of Physiology, 25 Shattuck St, Boston 15, Mass *Associate* (1, 1950)
- Chatterjee, Hernendra Nath, M D 9 Romes Mitter Rd, Bhowanipour, Calcutta, India *Professor* (6, 1948)
- Cheever, Francis Sargent, M D Univ of Pittsburgh Grad School of Public Health, Pittsburgh 13, Pa (6, 1950)
- Cheldelin, Vernon H, Ph D Oregon State College, Corvallis *Prof of Chemistry* (2, 1947, 5, 1946)
- Chen, Graham, Sc D, M D Parke Davis and Co, Detroit, Mich (3, 1944)
- Chen, K K, Ph D, M D Lilly Research Labs, Indianapolis, Ind *Dir of Pharmacological Research, Prof of Pharmacology, Indiana Univ School of Medicine* (1, 1929, 3, 1942)
- Cheney, Ralph H, Sc D Brooklyn College, Biology Dept, Bedford Ave and Ave H, Brooklyn 10, N Y *Professor* (3, 1934)
- Chenoweth, Maynard Burton, M D Univ of Michigan Med School, Dept of Pharmacology, Ann Arbor *Assoc Prof of Pharmacology* (3, 1945)
- Chesley, Leon C, Ph D Margaret Hague Maternity Hospital, 88 Clifton Place, Jersey City 4, N J *Chief Chemist* (1, 1949)
- Chesney, Alan M, M D Johns Hopkins Hospital, Baltimore, Md *Dean of Johns Hopkins Med School, Assoc Prof of Medicine* (4, 1925)
- Child, Charles M, Ph D Stanford Univ, Stanford, Calif *Prof Emeritus, of Zoology, Stanford Univ* (1R, 1923)
- Child, George P, Ph D, M D Albany Med College, Albany 3, N Y *Asst Prof of Pharmacology* (3, 1949)
- Chin, Yin-Ch'ang, Ph D 1268 Sixth Ave, San Francisco, Calif *Research Fellow, Univ of California, Asst Prof, Peking Union Med College* (3, 1950)
- Chinn, Herman I, Ph D School of Aviation Medicine, Randolph Field, Tex *Chief, Dept of Pharmacology and Biochemistry* (1, 1950)
- Choucroun, Nine Dept of Public Health and Preventive Medicine, 1300 York Ave, New York City 22 *Research Assoc, Cornell Med College* (6, 1949)
- Chow, Bacon F, Ph D Johns Hopkins Univ School of Hygiene, 615 N Wolfe St, Baltimore 14, Md *Assoc Prof of Biochemistry* (2, 1940, 5, 1948, 6, 1944)
- Christensen, Halvor N, Ph D Tufts College Med School, Boston, Mass *Prof and Head of Dept of Biochemistry* (2, 1947)
- Christensen, L Royal, Ph D New York Univ College of Medicine, Dept of Microbiology, 477 First Ave, New York City *Asst Prof* (6, 1942)
- Christian, Henry A, M D 20 Chapel St, Brookline, Mass *Hersey Prof Emeritus of the Theory and Practice of Physics, Harvard Univ, Physician-in-Chief, Emeritus, Peter Bent Brigham Hospital* (4, 1924)
- Christman, Adam A, Ph D Univ of Michigan Med School, Ann Arbor *Prof of Biological Chemistry* (2, 1929)
- Chu, Wei-chang, M D 546 W 124th St, Apt 53, New York City (3, 1945)
- Clark, Ada R, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc in Bacteriology, Teaching and Research* (6, 1936)
- Clark, Byron B, Ph D Tufts College Med School, 136 Harrison Ave, Boston 15, Mass *Prof of Pharmacology* (3, 1940)
- Clark, Eliot R, M D Univ of Pennsylvania, Philadelphia *Prof of Anatomy* (1R, 1919)
- Clark, Ernest D, Ph D 826 Skinner Bldg, Seattle 1, Wash *Dir of the Labs, Northwest Branch, Nail Cannery's Assoc* (2, 1912)
- Clark, George, Ph D Chicago Med School, Dept of Anatomy, 710 S Wolcott Ave, Chicago 12, Ill *Assoc Prof of Neuroanatomy* (1, 1943)
- Clark, Guy W, Ph D R F D 5330 Wild Horse Valley Rd, Napa, Calif *Technical Dir, Lederle Labs, Div of American Cyanamid Co* (2, 1922)
- Clark, Janet Howell, Ph D Univ of Rochester, Anderson Hall, Rochester, N Y *Dean of the College for Women and Prof in the Div of Biological Sciences* (1, 1922)
- Clark, Paul F, Ph D Univ of Wisconsin Med School, Madison *Prof of Med Microbiology* (4, 1923, 6, 1928)
- Clark, William G, Ph.D 2524 Prosser Ave, Los Angeles, Calif *Clin Assoc Prof of Physiological Chemistry, Univ of Southern California at Los Angeles School of Medicine, Chief, Pharmacology-Physiology Section, General Med Research Service, V A Center* (1, 1942, 3, 1949)
- Clark, William Mansfield, Ph D Johns Hopkins Univ, Baltimore, Md *Prof of Physiological Chemistry* (2, 1920)
- Clarke, Hans Thacher, D Sc Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Prof of Biological Chemistry* (2, 1929)
- Clarke, Robert W Route 3, Helmswoods, Elizabethtown, Ky *Physiologist, Med Dept Field Research Lab, Fort Knox* (1, 1936)
- Clausen, Samuel Wolcott, M D Univ of Rochester School of Medicine, Rochester, N Y *Prof of Pediatrics* (2, 1922)
- Cleghorn, Robert Allen, M D, D Sc McGill Univ, Dept of Psychiatry, Montreal, Quebec, Canada (1, 1937)

- Clowes, George Henry Alexander, Ph D Eli Lilly & Co, Indianapolis 6, Ind *Dir of Research Emeritus* (2, 1914, 6, 1919)
- Coburn, Alvin F, M D Rheumatic Fever Research Inst, Chicago, Ill *Director* (6, 1948)
- Code, Charles F, Ph D, M D Mayo Foundation, Rochester, Minn *Prof of Physiology* (1, 1939, 3, 1950)
- Coffey, Julia M, A B Div of Labs and Research, New York State Dept of Health, Albany *Assoc Bacteriologist* (6, 1937)
- Coghill, Robert D, Ph D Abbott Labs, N Chicago, Ill *Dir of Research* (2, 1932)
- Cohen, Barnett, Ph D Johns Hopkins Univ School of Medicine, 710 N Washington St, Baltimore 5, Md *Assoc Prof of Physiological Chemistry* (2, 1935)
- Cohen, Philip P, Ph D, M D Univ of Wisconsin, Service Memorial Inst, Madison *Prof of Physiological Chemistry* (2, 1941)
- Cohen, Saul L, Ph D Univ of Minnesota, 207 Millard Hall, Minneapolis *Asst Prof of Physiological Chemistry* (2, 1948)
- Cohen, Seymour S, Ph D Children's Hospital, 1740 Bainbridge St, Philadelphia, Pa *Assoc Prof of Physiological Chemistry and Pediatrics, Univ of Pennsylvania School of Medicine* (2, 1946)
- Cohen, Sophia M, B S New York State Dept of Health, Div of Labs and Research, Albany *Sr Bacteriologist* (6, 1938)
- Cohn, Alfred E, M D Rockefeller Inst for Med Research, 66th St and York Ave, New York City 21 *Member* (1R, 1911, 3, 1913)
- Cohn, Clarence, M D Michael Reese Hospital, Med Research Inst, Chicago, Ill *Dir of Dept of Biochemistry* (1, 1948)
- Cohn, Edwin J, Ph D 183 Brattle St, Cambridge, Mass *Prof of Biological Chemistry, Harvard Med School, Univ Prof, Harvard Univ* (1, 1919, 2, 1919)
- Cohn, Mildred, Ph D Harvard Univ Med School, Boston 15, Mass *Research Assoc, Biochemistry* (2, 1949)
- Cohn, Waldo E, Ph D Oak Ridge Natl Lab, Biology Div, Oak Ridge, Tenn *Biochemist* (2, 1944)
- Cole, Harold H, Ph D Univ of California, College of Agriculture, Div of Animal Husbandry, Davis *Professor* (1, 1947)
- Cole, Harold N, Ph B, M D 1352 Hanna Bldg, Cleveland, Ohio *Clin Prof of Dermatology and Syphilology, Western Reserve Univ* (3, 1925)
- Cole, Kenneth S, Ph D Univ of Chicago, Inst of Radiobiology and Biophysics, Chicago 37, Ill *Prof of Biophysics* (1, 1934)
- Cole, Rufus, M D, D Sc Mount Kisco, N Y *Member Emeritus, Rockefeller Inst for Med Research* (4R, 1924, 6R, 1917)
- Cole, Versa V, Ph D, M D Indiana Univ School of Medicine, 1040-1232 W Michigan St, Indianapolis *Assoc Prof of Pharmacology* (3, 1941)
- Colfer, Harry F, M D, Ph D 9 Kempshall Ter, Fanwood, N J *Research Physician, Merck & Co, Rahway, Asst Physician, Presbyterian Hospital, N Y C* (1, 1950)
- Collett, Mary Elizabeth, Ph D Western Reserve Univ, Mather College, Cleveland, Ohio *Assoc Prof of Biology* (1, 1921)
- Collier, H Bruce, Ph D Univ of Alberta, Dept of Biochemistry, Edmonton, Alta, Canada *Prof of Biochemistry* (2, 1944)
- Collings, William Doynne, Ph D Michigan State College, Dept of Physiology, East Lansing (1, 1944)
- Collins, Dean A, Ph D, M D Temple Univ School of Medicine, 3400 N Broad St, Philadelphia 40, Pa *Prof of Pharmacology* (1, 1938)
- Collins, Russell J, A M, M D St John, New Brunswick, Canada *Med Superintendent of St John Tuberculosis Hospital* (3, 1915)
- Collip, J B, Ph.D M D Univ of Western Ontario, R R 3, London, Ontario, Canada *Dean of Medicine and Prof of Med Research* (1, 1920, 2, 1920)
- Colowick, Sidney P, Ph D Johns Hopkins Univ, McCollum Pratt Inst, Baltimore 18, Md *Assoc Prof* (2, 1944)
- Coman, Dale R, M D Univ of Pennsylvania School of Medicine, McManes Lab of Pathology, Philadelphia *Prof of Exper Pathology* (4, 1939)
- Comroe, Julius H, Jr, M D Univ of Pennsylvania Grad School of Medicine, Philadelphia *Prof of Physiology and Pharmacology* (1, 1943, 3, 1939)
- Conant, James B, Ph D Harvard Univ, 5 Univ Hall, Cambridge, Mass *President* (2, 1932)
- Concepcion, Isabelo, M D 589 Zamora, Pasay, Rizal, Philippines Faculty of Medicine, Univ Santo Tomas, Manila, Philippines *Prof of Biochemistry and Nutrition* (1, 1919)
- Conklin, Ruth E, Ph D Vassar College, Poughkeepsie, N Y *Prof of Physiology* (1, 1940)
- Conn, Jerome W, M D Univ of Michigan Med School, Ann Arbor *Assoc Prof of Internal Med* (5, 1942)
- Consolazio, William V, B S Office of Naval Research, Navy Dept, Washington 25, D C *Head of Biochemistry Branch* (2, 1949)
- Cook, Donald Hunter, Ph D Univ of Miami, Coral Gables 34, Fla *Prof of Chemistry* (2, 1929)
- Cooke, Robert A, A M, M D 60 E 58th St, New York City *Dir of Dept of Allergy, Roosevelt Hospital* (6, 1920)
- Coolidge, Thomas B, M D, Ph D Univ of Chicago, Abbot Hall, Chicago 37, Ill *Assoc Prof*,

- Dept of Biochemistry and Walter G Zoller Memorial Dental Clinic* (2, 1942)
- Coon, Julius M**, Ph D, M D Univ of Chicago, Chicago 37, Ill *Assoc Prof of Pharmacology, Dir of Toxicity Lab* (3, 1941)
- Coons, Albert H**, M D Harvard Univ, 25 Shattuck St, Boston 15, Mass *Assoc in Bacteriology and Immunology* (6, 1950)
- Coons, Callie Mae**, Ph D U S Dept of Agriculture, Bureau of Human Nutrition and Home Economics, Washington, D C *Asst Chief* (5, 1933)
- Cooper, Merlin L**, M D Children's Hospital Research Foundation, Elland Ave and Bethesda, Cincinnati 29, Ohio *Assoc Prof of Bacteriology, Asst Prof of Pediatrics, Univ of Cincinnati College of Medicine* (6, 1949)
- Cooper, Ruth S** Princeton Univ, Dept of Biology, Princeton, N J (6, 1949)
- Copley, Alfred Lewin**, M D New York Univ, Dept of Biology, Lab of Cellular Physiology, Washington Square, New York City 3 *Research Assoc in Medicine, Asst Clin Prof, New York Med College* (1, 1944)
- Corbin, Kendall B**, M D 919 80th St, S W, Rochester, Minn *Consultant in Neurology, Mayo Clinic, Prof of Neuroanatomy, Mayo Foundation* (1, 1941)
- Corcoran, Arthur Curtis**, C M, M D Cleveland Clinic Foundation, Cleveland 6, Ohio (1, 1940)
- Corey, Edward Lyman**, Ph D Univ of Virginia School of Medicine, Charlottesville *Prof of Physiology* (1, 1931)
- Cori, Carl F**, M D Washington Univ School of Medicine, Kingshighway and Euclid Ave, St Louis 10, Mo *Prof of Biochemistry* (2, 1925, 3, 1934)
- Cori, Gerty T**, M D Washington Univ School of Medicine, St Louis 10, Mo *Prof of Biochemistry* (2, 1927, 3, 1934)
- Corley, Ralph Conner**, Ph D Purdue Univ, Dept of Chemistry, Lafayette, Ind *Prof of Biochemistry* (2, 1927)
- Cornatzer, W E**, Ph D Bowman Gray School of Medicine, Winston-Salem, N C *Asst Prof of Biochemistry* (2, 1950)
- Corper, Harry J**, M D, Ph D 1295 Clermont St, Denver 7, Colo *Dir of Research, Natl Jewish Hospital and Univ of Colorado School of Medicine* (2, 1912)
- Corson, Samuel A**, Ph D Toledo Hospital Inst of Med Research, 2805 Oatis Ave, Toledo 6, Ohio *Chief, Dept of Physiology* (1, 1943)
- Cotts, Gerhard K**, M D 1100 Church St, Lynchburg, Va (3, 1937)
- Co Tui, C** M D 15 E 62nd St, New York City 21 *Dir, Biologic Research, Creadmore Inst for Psychobiologic Studies* (3, 1931)
- Couch, James Russell**, Ph D Texas A & M College, College Station *Prof of Poultry Husbandry, Biochemistry and Nutrition* (5, 1950)
- Cournand, Andre Frederic**, M D Chest Service, Bellevue Hospital, C D Building, 1st Ave at 28th St, New York City *Assoc Prof of Medicine, College of Physicians and Surgeons, Columbia Univ* (1, 1944)
- Cowgill, George Raymond**, Ph D Yale Univ, Nutrition Lab, 333 Cedar St, New Haven 11, Conn *Prof of Nutrition, Dept of Physiological Chemistry* (1, 1923, 2, 1922, 5, 1933)
- Cox, Alvin J, Jr**, M D Stanford Univ School of Medicine, 2398 Sacramento St, San Francisco 15, Calif *Prof of Pathology* (4, 1949)
- Cox, Gerald J**, Ph D Univ of Pittsburgh School of Dentistry, Pittsburgh 13, Pa *Prof of Dental Research* (2, 1930, 5, 1935)
- Cox, Herald R**, Sc D Lederle Labs Div, American Cyanamid Co, Pearl River, N Y *Dir, Viral and Rickettsial Research* (6, 1946)
- Cox, Warren M, Jr**, Ph D Mead Johnson & Co, Evansville, Ind *Dir of Research* (2, 1935, 5, 1945)
- Craig, Francis Northrop**, Ph D Med Div, Army Chemical Center, Md *Chief, Applied Physiology Section* (1, 1946)
- Craig, L C**, Ph D Rockefeller Inst for Med Research, 66th St and York Ave, New York City 21 *Assoc Member* (2, 1938)
- Crampton, E W**, Ph D McGill Univ, Macdonald College, Montreal, Quebec, Canada *Prof of Nutrition* (5, 1940)
- Crandall, Lathan A, Jr**, M D, Ph D Miles Labs, Inc, Elkhart, Ind (1, 1930)
- Cranston, Elizabeth M**, Ph D Univ of Minnesota Med School, Dept of Pharmacology, Minneapolis 14 *Asst Prof* (3, 1946)
- Cravens, W W**, Ph D Univ of Wisconsin, Poultry Dept, Madison *Assoc Prof of Poultry Husbandry* (5, 1947)
- Craver, Bradford N**, Ph D, M D Ciba Pharmaceutical Products, Inc, Lafayette Park, Summit, N J *Sr Pharmacologist* (3, 1946)
- Crawford, Madeleine Field**, Ph D 9 High Rock St, Needham, Mass *Assoc in Physiology, Harvard School of Public Health* (1, 1933)
- Crescitelli, Frederick**, Ph D Univ of California, Dept of Zoology, Los Angeles *Physiologist* (1, 1946)
- Cretcher, Leonard H**, Ph D Univ of Pittsburgh, Mellon Inst of Industrial Research, Pittsburgh Pa *Asst Dir and Head of Dept of Research in Pure Chemistry* (2, 1930)
- Crider, Joseph O**, M D Jefferson Med College, Philadelphia, Pa *Prof of Physiology* (1, 1935)
- Crisler, George R**, Ph D, M D 157 E New England Ave, Winter Park, Fla (1, 1930)
- Crismon, Jefferson Martineau**, M D Stanford Univ, Calif *Assoc Prof of Physiology* (1, 1944)

- Crittenden, Phoebe J**, Ph D Goucher College, Dept of Physiology and Bacteriology, Towson 4, Md *Prof and Chairman of Dept of Physiology* (1, 1937, 3, 1937)
- Crozier, William J**, Ph D Harvard Univ, Biological Labs, Cambridge, Mass *Prof of General Physiology* (1, 1928)
- Csonka, F A**, Ph D U S Dept of Agriculture, Bureau of Human Nutrition and Home Economics, Beltsville, Md *Sr Chemist* (2, 1924)
- Cullen, Stuart C**, M D Univ Hospital, Iowa City, Iowa *Asst Prof of Surgery-Anesthesia* (3, 1944)
- Culler, Elmer A**, Ph D Univ of Rochester, Rochester, N Y *Prof of Psychology and Dir of Lab* (1R, 1936)
- Cunha, Tony Joseph**, Ph D Univ of Florida, Dept of Animal Husbandry, Gainesville *Assoc Prof, Assoc Animal Husbandman* (5, 1950)
- Cunningham, Raymond W**, Ph D Lederle Labs, Inc, Pearl River, N Y *Director, Pharmacology Research* (3, 1941)
- Cunningham, Robert Sydney**, M D, Sc D Albany Med College, Albany, N Y *Prof of Anatomy and Dean* (1, 1923)
- Cureton, Thomas Kirk, Jr**, Ph D Univ of Illinois, School of Physical Education, Urbana *Prof of Physical Education* (1, 1946)
- Curnen, Edward C**, M D Yale Univ School of Medicine, New Haven 11, Conn *Assoc Pediatrician, New Haven Hospital* (6, 1941)
- Cartis, George Morris**, Ph D, M D Ohio State Univ, Kinsman Hall, Columbus *Prof of Surgery, Chairman, Dept of Research Surgery* (1, 1933, 4, 1933)
- Curtis, Howard J**, Ph D Brookhaven Natl Lab, Upton, L I, N Y (1, 1940)
- Cutting, Windsor C**, M D Stanford Univ School of Medicine, San Francisco, Calif *Prof of Pharmacology and Therapeutics* (3, 1939)
- Daft, Floyd Shelton**, Ph D Natl Insts of Health, Bethesda, Md *Acting Director, Exper Biology and Medicine Inst* (2, 1949, 5, 1941)
- Daggs, Ray Gilbert**, Ph D Med Dept, Field Research Lab, Fort Knox, Ky *Dir of Research* (1, 1935, 5, 1933)
- Dakin, Henry D**, D Sc, Ph D Scarborough-on-Hudson, N Y (2, 1906)
- Dalldorf, Gilbert**, M D New York State Dept of Health, Albany *Dir, Div of Labs and Research* (4, 1947)
- Dalton, Albert J**, Ph D Natl Cancer Inst, Bethesda, Md *Principal Cytologist* (4, 1942)
- Dam, Henrik**, Ph D Polytechnic Inst Dept of Biology, Østervoldgade 10 L Copenhagen K Denmark *Professor* (2, 1944, 5, 1943)
- D'Amour, Fred E**, Ph D 2311 S Josephine St, Denver, Colo *Assoc Prof, Dept of Zoology, Univ of Denver* (1, 1934)
- D'Amour, Marie C**, Ph D, M D Olive View Sanatorium, Olive View, Calif (1, 1934)
- D'Angelo, Savino A**, Ph D Jefferson Med College, Dept of Anatomy, 307 S 11th St, Philadelphia, Pa (1, 1947)
- Daniel, Louise J**, Ph D Cornell Univ, Savage Hall, Ithaca, N Y *Asst Prof of Biochemistry* (2, 1949)
- Daniels, Amy L**, Ph D 720 N Van Buren St, Iowa City, Iowa (2, 1919, 5R, 1933)
- Danielson, Irvin S**, Ph D Lederle Labs, Amer Cyanamid Co, 18 Bogert Ave, Pearl River, N Y *Asst Dir, Animal Industry Section* (2, 1937)
- Danowski, T S**, M D Univ of Pittsburgh School of Medicine, Pittsburgh, Pa *Renzieshausen Prof of Research Medicine* (1, 1947)
- Darby, William J**, M D, Ph D Vanderbilt Univ School of Medicine, Div of Nutrition, Nashville, Tenn *Prof of Biochemistry, Asst Prof of Medicine* (2, 1949, 5, 1945)
- Darling, Robert Croly**, M D 157 Glenwood Ave, Leonia, N J Columbia Univ College of Physicians and Surgeons, Dept of Medicine, New York City 32 (1, 1944)
- Darrow, Chester W**, Ph D Inst for Juvenile Research, 907 S Wolcott Ave, Chicago, Ill *Psychophysiologist, Assoc Prof of Criminology, Univ of Illinois College of Medicine* (1, 1937)
- Darrow, Daniel Cady**, M D Yale Univ School of Medicine, New Haven, Conn *Prof of Pediatrics* (2, 1936)
- Daubert, B F**, Ph D Univ of Pittsburgh, 220 Alumni Hall, Dept of Chemistry, Pittsburgh 13, Pa *Research Prof and Research Admin* (2, 1947)
- Davenport, Fred M**, M D, D M Sc 1303 Gardner Ave, Ann Arbor, Mich *Research Assoc* (6, 1950)
- Davenport, Horace Willard**, Ph D Univ of Utah, Dept of Physiology, Salt Lake City 1 (1, 1942)
- Davenport, Virginia D**, Ph D Univ of Utah College of Medicine, Salt Lake City *Research Assoc in Physiology* (1, 1950)
- David, Norman Austin**, M D Univ of Oregon Med School, Portland *Prof of Pharmacology* (3, 1934)
- Davidsohn, Israel**, M D Mount Sinai Hospital, Chicago, Ill *Pathologist and Dir of Labs, Chicago Med School, Prof of Pathology and Chairman of Dept* (4, 1939, 6, 1929)
- Davidson, Charles S**, M D Boston City Hospital, Thorndike Memorial Lib, Boston 18, Mass *Assoc in Medicine, Harvard Med School, Assoc Dir, 2nd and 4th Med Services, Boston City Hospital* (5, 1949)
- Davies, Philip W**, Ph D Johns Hopkins Univ, Biophysics Dept Baltimore 18, Md (1, 1948)

- Davis, Bernard D , M D Cornell Univ Med College, New York City *Research Assoc, Surgeon, USPHS* (6, 1948)
- Davis, George Kelso, Ph D Nutrition Lab , Animal Industry Dept , Agricultural Exper Station, Gainesville, Fla *Nutritional Technologist and Biochemist, Prof of Nutrition, Univ of Florida, Florida Agricultural Exper Station* (5, 1944)
- Davis, Hallowell, M D Central Inst for the Deaf, 818 S Kingshighway, St Louis 10, Mo (1, 1925)
- Davis, Harry A , M D College of Med Evangelists, Dept of Surgery, 2007 Wilshire Blvd , Los Angeles 5, Calif *Clin Prof of Surgery* (4, 1944)
- Davis, John Emerson, Ph D Univ of Arkansas School of Medicine, Little Rock *Prof of Pharmacology and Physiology* (1, 1941, 3, 1941)
- Davis, M Edward, M D Chicago Lying-In Hospital, 5541 Maryland Ave , Chicago 37, Ill *Joseph Bolvar de Lec Prof of Obstetrics, Univ of Chicago* (3, 1950)
- Dawson, Charles R , Ph D Columbia Univ , 411 Havemeyer Hall, New York City 27 *Assoc Prof of Chemistry* (2, 1946)
- Dawson, James Robertson, Jr , M D Univ of Minnesota School of Medicine, Minneapolis 14 *Prof of Pathology* (4, 1940)
- Dawson, Percy M , M D 97 E Portola Ave , Los Altos, Calif *Lecturer in Physiology, Retired, Stanford Univ* (1R, 1900)
- Day, Harry G , D Sc Indiana Univ , Dept of Chemistry, Bloomington *Professor* (2, 1948, 5, 1940)
- Day, Paul L , Ph D Univ of Arkansas School of Medicine, Little Rock *Prof of Biochemistry* (2, 1934, 5, 1933)
- De, N N , M B Indian Inst of Science, P O Malleswaram, Bangalore, India *Asst Prof of Pharmacology* (3, 1948)
- Dearborn, Earl H , Ph D , M D Johns Hopkins Univ School of Medicine, 710 N Washington St Baltimore 5, Md *Asst Prof of Pharmacology and Exper Therapeutics* (3, 1946)
- de Beer, Edwin J , Ph D The Wellcome Research Labs , Tuckahoe, N Y *Acting Dir of Research, Head, Dept of Pharmacology* (3, 1944)
- De Bodo, Richard C , M D 477 First Ave , New York City *Assoc Prof of Pharmacology, New York Univ College of Medicine* (1, 1932, 3, 1931)
- De Boer, Benjamin, Ph D St Louis Univ School of Medicine, 1402 S Grand Blvd , St Louis 4, Mo *Assoc Prof of Pharmacology* (1, 1947, 3, 1948)
- DeEds, Floyd, Ph D 344 Santa Ana Ave , San Francisco, Calif *Principal Pharmacologist, Western Regional Research Lab , Albany, Calif* (2, 1937, 3, 1927)
- Defandorf, James Holmes, Ph D 130 Hesketh St , Chevy Chase, Md *Colonel, Chem Corps , A U S* (3, 1940)
- de Gara, Paul F , M D 200 Pinehurst Ave , New York City *Instr in Pathology, Cornell Univ Med College, Physician, New York Hospital* (6, 1941)
- DeGraff, Arthur C , M D New York Univ College of Medicine, New York City *Prof of Therapeutics* (1, 1950, 3, 1937)
- de Gutierrez-Mahoney, C G , M D St Vincent's Hospital, New York City *Dir , Neurological Div and Neurosurgeon-in-Chief* (1, 1940, 4, 1941)
- Deichmann, William B , Ph D Albany Med College, Albany, N Y *Assoc Prof and Head, Div of Pharmacology* (3, 1941)
- del Pozo, E C , M D Medellin 196, Mexico, D F , Mexico (1, 1943)
- Dempsey, Edward W , Ph D Washington Univ School of Medicine, St Louis 10, Mo *Assoc Prof of Anatomy* (1, 1940)
- Denslow, J S , D O Kirksville College of Osteopathy, Still Memorial Research Trust, Kirksville, Mo *Researcher* (1, 1949)
- Denstedt, Orville F , Ph D McGill Univ , Dept of Biochemistry, Montreal, Que , Canada *Assoc Prof* (2, 1948)
- Derbyshire, Arthur J , Ph D Harper Hospital, EEG Dept , Detroit, Mich (1, 1939)
- de Savitsch, Eugene, M D Suite 24, 1150 Connecticut Ave , Washington, D C *Surgeon (R) USPHS, Consulting Surgeon, Home for Incurables* (4, 1934)
- Dethier, Vincent G , Ph D Johns Hopkins Univ , Dept of Biology, Baltimore 18, Md *Assoc Prof* (1, 1950)
- Dettwiler, Herman A , Ph D Eli Lilly and Co , Indianapolis, Ind *Asst Dir , Biological Div* (6, 1946)
- Deuel, Harry J , Jr , Ph D Univ of Southern California, Los Angeles *Prof of Biochemistry and Dean of Grad School* (1, 1928, 2, 1924, 6, 1933)
- Deulofeu, Venancio D Chem Casilla Correo 2539, Buenos Aires, Argentina *Prof of Organic Chemistry, Univ of Buenos Aires* (2, 1942)
- Deutsch, Harold F , Ph D Univ of Wisconsin, Dept of Physiological Chemistry, Madison 6 *Assoc Prof* (2, 1948)
- Dewey, Virginia C , Ph D Amherst College, Biological Lab , Amherst, Mass *Research Assoc , Dept of Biology* (2, 1949)
- Dey, Frederick L , Ph D , M D Niantic, Conn *Lt (j g) , U S A R* (1, 1945)
- Deyrup, Ingrith J , Ph D Barnard College,

- Columbia Univ, Dept of Zoology, New York City 27 Asst Prof (1, 1949)
- Dickison, H L**, Ph D Bristol Labs, Inc, Bldg 6, Syracuse 1, N Y Dir, *Pharmacological Research* (3, 1946)
- Dieckmann, William J**, M D The Chicago Lying-In Hospital, 5841 Maryland Ave, Chicago 37, Ill Chief of Service, Prof and Chairman of Dept of Obstetrics and Gynecology, Univ of Chicago (3, 1947)
- Dienes, Louis**, M D Massachusetts General Hospital, Boston *Bacteriologist* (6, 1924)
- Dill, David Bruce**, Ph D Med Div, Army Chemical Center, Md *Scientific Div* (1, 1941, 2, 1927, 5, 1936)
- Dille, James M**, Ph D, M D Univ of Washington School of Medicine, Seattle 5 Prof and Exec Officer, Dept of Pharmacology (3, 1939)
- Dillon, Robert T**, Ph D G D Searle and Co, Box 5110, Chicago 80, Ill Head, *Analytical Div* (2, 1934)
- Dingle, John H**, Sc D, M D Western Reserve Univ School of Medicine, Cleveland 6, Ohio Prof of Preventive Medicine (6, 1941)
- Di Palma, Joseph R**, M D Long Island College of Medicine, 350 Henry St, Brooklyn, N Y Assoc in Physiology (1, 1943)
- Dische, Zacharias**, M D Columbia Univ College of Physicians and Surgeons, Dept of Ophthalmology, 630 W 168th St, New York City 32 Asst Prof of Biochemistry (2, 1944)
- Dittmer, Karl**, Ph D Florida State Univ, Dept of Chemistry, Tallahassee Prof and Dept Exec (2, 1950)
- Dixon, Frank James, Jr**, M D Washington Univ, Dept of Pathology, Euclid Ave and Kingshighway, St Louis 10, Mo Instructor (6, 1950)
- Dixon, Harold M**, M D Veterans Admin Regional Office, San Diego, Calif (4, 1936)
- Doan, Charles A**, M D Ohio State Univ College of Medicine, Columbus Dean, Prof of Medicine (4, 1928)
- Dobriner, Konrad**, M D Sloan-Kettering Inst, 444 E 68th St, New York City 21 Member (2, 1946)
- Dochez, A Raymond**, M D Presbyterian Hospital, 620 W 168th St, New York City John E Borne Prof of Medicine and Surgical Research, Columbia Univ (4R, 1917, 6R, 1922)
- Dodd, Matthew C**, Ph D Ohio State Univ, Dept of Bacteriology, Columbus 10 Assoc Prof of Bacteriology and Immunology (6, 1950)
- Dodds, Mary L**, Ph D Pennsylvania State College, State College Prof, *Foods and Nutrition Research* (5, 1948)
- Dohan, F Curtis**, M D 80 Princeton Rd, Chadds Ford, Pa Fellow, George S Cox Med Research Inst, Assoc in Medicine, Univ of Pennsylvania (1, 1941)
- Daisy, Edward A**, Ph D St Louis Univ School of Medicine, St Louis 4, Mo Prof of Biological Chemistry (2, 1920)
- Dolman, C E**, DPH, Ph D Univ of British Columbia, Vancouver, B C, Canada Head of Dept of Bacteriology and Preventive Medicine (6, 1947)
- Dominguez, Rafael**, M D Western Reserve Univ, Cleveland, Ohio Asst Prof of Pathology, Dir, Div of Labs and Research, St Luke's Hospital (1, 1935)
- Donahue, D D**, D Sc 4228 Military Rd, N W, Washington 15, D C (3, 1941)
- Dooley, M S**, M D Syracuse Univ College of Medicine, Syracuse, N Y Prof of Pharmacology (3R, 1923)
- Dorfman, Albert**, PhD, M D Univ of Chicago, Dept of Pediatrics, Chicago, Ill Asst Prof (2, 1948)
- Dorfman, Ralph I**, Ph D Western Reserve Univ School of Medicine, Dept of Biochemistry, Cleveland, Ohio Asst Prof of Biochemistry (2, 1940)
- Doti, Louis Basil**, Ph D St Luke's Hospital, Amsterdam Ave and 113th St, New York City Chemist, Lecturer in Physiology and Biochemistry, New York Med College (1, 1937)
- Doty, J Roy**, Ph D American Dental Assoc, 222 E Superior St, Chicago, Ill Sr Chemist (2, 1941)
- Doudoroff, Michael**, Ph D Univ of California, Dept of Bacteriology, 3519 Life Sciences Bldg, Berkeley 4 Assoc Prof (2, 1946)
- Dougherty, Thomas F**, Ph D Univ of Utah School of Medicine, Dept of Anatomy, Salt Lake City Prof and Chairman of Dept (1, 1950)
- Dounce, Alexander L**, Ph D Strong Memorial Hospital, 260 Crittenden Blvd, Rochester N Y Instr in Biochemistry, Univ of Rochester School of Medicine and Dentistry (2, 1944)
- Doupe, Joseph**, M D Medical College, Dept of Physiology and Med Research, Bannatyne and Emily, Winnipeg, Manitoba, Canada Professor (1, 1949)
- Dow, Philip**, Ph D Medical College of Georgia, Augusta Assoc Prof of Physiology (1, 1939)
- Dow, Robert S**, M D, Ph D Univ of Oregon Med School, Portland, Assoc Prof of Anatomy (1, 1940)
- Downs, Ardrey W**, M D, D Sc Univ of Alberta, Edmonton, Alberta, Canada Prof of Physiology and Pharmacology (1R, 1917)
- Downs, Cora M**, Ph D 1625 Alabama St, Lawrence, Kan Prof of Bacteriology (6, 1929)
- Doyle, William Lewis**, Ph D 930 E 58th St, Chicago 37, Ill Prof of Anatomy, Univ of Chicago (1, 1946)
- Drabkin, David L**, M D Univ of Pennsylvania Grad School of Medicine, Philadelphia 4 Prof

- and Chairman of Dept of Physiological Chemistry (2, 1928, 5, 1934)
- Dragstedt, Carl A**, Ph D, M D Northwestern Univ Med School, 303 E Chicago Ave, Chicago, Ill Prof and Chairman of Dept of Pharmacology (1, 1928, 3, 1932)
- Dragstedt, Lester R**, M D, Ph D Univ of Chicago, Chicago, Ill Prof of Surgery (1, 1920)
- Draize, J H**, Ph D Food and Drug Admin, Div of Pharmacology, Federal Security Agency, Washington, D C Pharmacologist (3, 1940)
- Drake, T G H**, M B Univ of Toronto, Toronto, Canada Jr Demonstrator in Pediatrics, Dept of Medicine, Assoc Dir, Research Lab, Hospital for Sick Children (5, 1936)
- Draper, William B**, M Sc, M D Univ of Colorado School of Medicine, 4200 E 9th Ave, Denver Prof of Physiology and Pharmacology (1, 1947, 3, 1938)
- Dreisbach, Robert H**, Ph D, M D Stanford Univ School of Medicine, San Francisco 15, Calif Assoc Prof of Pharmacology (3, 1945)
- Dreyer, Nicholas Bernard**, M A Univ of Vermont School of Medicine, Burlington Prof of Physiology and Pharmacology (3, 1942)
- Drill, Victor Alexander**, Ph D, M D Wayne Univ College of Medicine, Detroit 26, Mich Prof of Pharmacology (1, 1943, 3, 1946)
- Drinker, Cecil K**, M D P O Box 502, Falmouth, Mass (1, 1915)
- Dripps, Robert D**, M D Univ of Pennsylvania School of Medicine, Philadelphia 4 Prof of Anesthesiology (1, 1947, 3, 1945)
- Driver, Robert L**, B S, M S, Ph D Med College of Alabama, Birmingham 5 (1, 1945, 3, 1947)
- Drury, Douglas R**, M D Univ of Southern California, Los Angeles Prof of Physiology (1, 1932)
- Dubin, Harry E**, Ph D 11 W 42nd St, New York City 18 President, H E Dubin Labs, Inc (2, 1925)
- Dubin, Isadore N**, M D Natl Cancer Inst, Bethesda, Md Special Research Fellow (4, 1947)
- Dubnoff, Jacob W**, Ph D 1201 E California St, Pasadena 4, Calif Sr Research Fellow, California Inst of Technology (2, 1946)
- DuBois, Eugene F**, M D Cornell Univ Med School, 1300 York Ave, New York City Prof and Head of Dept of Physiology and Biophysics, Attending Physician, New York Hospital (1, 1913, 3R, 1921, 5R, 1935)
- Du Bois, Kenneth P**, Ph D Univ of Chicago, Dept of Pharmacology, Chicago 37, Ill Asst Prof (3, 1946)
- Dubos, Rene J**, Ph D, D Sc Rockefeller Inst for Med Research, 60th St and York Ave, New York City Head of Dept of Bacteriology (6, 1938)
- Dugal, L Paul**, Ph D Laval Univ Med School, Research Dept on Acclimatization, Quebec City, Canada Research Prof and Head of Dept, Assoc Dir of Inst of Hygiene (1, 1947)
- Dukes, H H**, D V M, M S Cornell Univ, New York State Veterinary College, Ithaca Prof of Veterinary Physiology (1, 1934)
- Dulaney, Anna D**, Ph D Univ of Tennessee, Pathological Inst, Memphis Assoc Prof of Bacteriology, Med School (6, 1924)
- Dumke, Paul Rudolph**, M D Hospital of the Univ of Pennsylvania, Dept of Anesthesiology, Philadelphia Assoc Prof, Assoc in Clin Pharmacology, Univ of Pennsylvania (3, 1942)
- Dumm, Mary E**, Ph D New York Univ-Belle vue Med Center, 477 First Ave, New York City 16 Adjunct Asst Prof of Chemistry (1, 1950)
- Dunlap, Charles E**, M D Tulane Univ of Louisiana, 1430 Tulane Ave, New Orleans Prof of Pathology (4, 1942)
- Dunn, Max Shaw**, Ph D Univ of California, Los Angeles Prof of Chemistry (2, 1933)
- Dunn, Thelma Brumfield**, M D Natl Cancer Inst, Bethesda, Md Pathologist (4, 1945)
- Durlacher, Stanley H** Med Div, Army Chemical Center, Md Chief, Section on Pathology (1, 1949)
- Durrant, Edwin P**, Ph D Ohio State Univ, Columbus Assoc Prof Emeritus of Physiology (1R, 1928)
- Dury, Abraham**, Ph D Dorn Lab for Med Research, Bradford Clinic, Bennett at Pleasant St, Bradford, Pa Asst Dir of Research (1, 1948)
- Dutcher, James D**, Ph D Squibb Inst for Med Research, New Brunswick, N J Research Assoc, Div of Organic Chemistry (2, 1946)
- Dutcher, R Adams**, D Sc Pennsylvania State College, State College Prof and Head of Dept of Agriculture and Biochemistry (2, 1920, 5, 1933)
- Duval, Charles Warren**, M D Sacred Heart Hospital, Pensacola, Fla Prof Emeritus of Pathology and Bacteriology, Tulane Univ (4, 1913)
- du Vigneaud, Vincent**, Ph D Cornell Univ Med College, 1300 York Ave, New York City 21 Prof of Biochemistry (2, 1929, 5, 1934)
- Dworkin, Simon**, D D S, M D McGill Univ, Biology Building, Montreal, Quebec, Canada Lecturer in Physiology, Faculty of Medicine (1, 1931)
- Dye, J A**, Ph D Cornell Univ, James Law Hall Ithaca, N Y Prof of Physiology (1, 1929)
- Dye, Marie**, Ph D Michigan State College, East Lansing Dean, School of Home Economics (2, 1929, 5, 1933)

- Dyer, Helen M., Ph D Natl Cancer Inst Bethesda, Md *Biochemist* (2, 1936, 5, 1937)
- Dziemian, Arthur J., Ph D Med Div, Army Chemical Center, Md *Physiologist, Biophysics Section* (1, 1948)
- Dziewiatkowski, Dominic D., Ph D Rockefeller Inst for Med Research, Hospital, 66th St and York Ave, New York City 21 *Assoc, Dept of Biochemistry* (2, 1950)
- Eadie, George S., Ph D Duke Univ School of Medicine, Box 3709, Durham, N C *Prof of Physiology and Pharmacology* (1, 1929, 3, 1940)
- Eagle, Edward, Ph D Swift and Co., Research Labs, Chicago 9, Ill *Research Physiologist* (1, 1950)
- Eagle, Harry, M D Natl Insts of Health, Bethesda, Md *Med Dir, USPHS, Chief of Section on Exper Therapeutics, Microbiological Inst* (3, 1946, 4, 1936)
- Eakin, Robert E., Ph D Univ of Texas, Dept of Chemistry, Austin *Assoc Prof of Chemistry* (2, 1948)
- Earle, D P., Jr., M D, Med Sc D New York Univ College of Medicine, 477 First Ave, New York City 16 *Assoc Prof of Medicine* (1, 1947)
- Earle, Wilton R., Ph D Natl Cancer Inst, Bethesda, Md *Cytologist, Head of Tissue Culture Unit* (4, 1940)
- Eaton, Monroe D., M D Harvard Med School, Boston, Mass *Assoc Prof of Bacteriology and Immunology* (6, 1937)
- Eckenhoff, James E., M D Hospital of the Univ of Pennsylvania, Philadelphia *Asst Prof of Anesthesiology, Assoc in Clin Pharmacology, Univ of Pennsylvania* (1, 1948)
- Ecker, E E., Ph D Western Reserve Univ School of Medicine, 2085 Adelbert Rd, Cleveland, Ohio *Prof of Immunology* (4, 1925, 6, 1947)
- Eckstein, Gustav, M D Univ of Cincinnati College of Medicine, Cincinnati, Ohio *Assoc Prof of Physiology* (1, 1948)
- Eckstein, Henry C., Ph D Univ of Michigan, 320 W Med Building, Ann Arbor *Assoc Prof of Biological Chemistry* (2, 1925)
- Eckstein, R W., M A, M D Western Reserve Univ, Dept of Medicine, Cleveland, Ohio *Sr Instr, in charge of Cardiovascular Exper Med Research Lab* (1, 1947)
- Eddy, Bernice E., Ph D Natl Insts of Health, Inst of Microbiology, Bethesda 14, Md *Sr Bacteriologist* (6, 1949)
- Eddy, Nathan B., M D Natl Insts of Health, Bethesda Md *Med Officer* (3, 1929)
- Eddy, Walter H. Ph D Southern Bio Research Lab Florida Southern College Lakeland *Assoc Dir* (2 1913, 5R, 1933)
- Edelmann, Abraham, Ph D Brookhaven Natl Labs, Upton, L I, N Y *Physiologist* (1, 1948)
- Ederstrom, Helge E., Ph D St Louis Univ School of Medicine, Dept of Physiology, 1402 S Grand Blvd, St Louis 4, Mo *Asst Prof* (1, 1949)
- Edholm, O G., M B Natl Inst for Med Research, Hampstead, London, N W 3, England *Head, Dept of Human Physiology* (1, 1948)
- Edsall, Geoffrey, M D Boston Univ School of Medicine, 80 E Concord St, Boston 18, Mass *Prof of Bacteriology* (6, 1943)
- Edsall, John Tileston, M D Harvard Med School, Univ Lab, Boston, Mass *Assoc Prof of Biological Chemistry, Tutor in Biochemical Sciences* (2, 1931)
- Edwards, Dayton J., Ph D Cornell Univ Med College, 1300 York Ave, New York City *Assoc Prof of Physiology, Asst Dean* (1, 1921)
- Edwards, Jesse E., M D Mayo Clinic, Rochester 4, Minn *Asst Prof of Pathologic Anatomy, Mayo Foundation* (4, 1941)
- Edwards, J Graham, Ph D 24 High St, Buffalo, N Y *Assoc Prof of Anatomy, Univ of Buffalo* (1, 1932)
- Edwards, Leslie E., Ph D Med College of Virginia, Dept of Physiology and Pharmacology, Richmond *Asst Prof* (1, 1950)
- Eggerth, Arnold H., Ph D Hoagland Lab, 335 Henry St, Brooklyn, N Y *Assoc Prof of Microbiology and Immunology, State Univ Med Center at New York* (4, 1925)
- Ehrenstein, Maximilian R., Ph D Univ of Pennsylvania Hospital, 806 Maloney Clinic, 36th and Spruce Sts, Philadelphia 4 *Prof of Physiological Chemistry assigned to Medicine, Univ of Pennsylvania School of Medicine* (2, 1942)
- Ehrich, William E., M D Univ of Pennsylvania, Philadelphia *Prof of Pathology, Grad School of Medicine, Chief, Div of Pathology, Philadelphia General Hospital* (4, 1945)
- Eichelberger, Lillian, Ph D Univ of Chicago, Dept of Surgery, Chicago, Ill *Assoc Prof of Biochemistry* (2, 1937)
- Eichna, Ludwig W., M D New York Univ College of Medicine, Dept of Medicine, 477 First Ave, New York City 16 *Assoc Prof of Medicine, Visiting Physician, Bellevue Hospital* (1, 1949)
- Eiler, John J., Ph D Univ of California Med Center, San Francisco 22 *Assoc Prof of Biochemistry and Pharmacology, Univ of California College of Pharmacy* (2, 1948)
- Eisenman, Anna J., Ph D U S Public Health Service Hospital, Lexington Ky *Biological Chemist* (2, 1930)
- Elberg, Sanford S. Ph D Camp Detrick Frederick Md (6 1948)

- Elderfield, Robert C, Ph D Columbia Univ, New York City *Prof of Chemistry* (2, 1934)
- Elftman, Herbert, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City *Assoc Prof in Anatomy* (1, 1940)
- Ehot, Martha M, M D World Health Organization, Palais des Nations, Geneva, Switzerland *Asst Dir General* (5, 1933)
- Elkinton, J Russell, M D Univ of Pennsylvania Hospital, Dept of Medicine Philadelphia (1, 1947)
- Elliott, Henry W, Ph D Univ of California Med School, San Francisco *Lecturer and Research Assoc in Pharmacology* (3, 1948)
- Elliott, K Allan C, Ph D Montreal Neurological Inst, 3801 Univ St, Montreal, Que, Canada *Asst Prof of Exper Neurology and Biochemistry* (2, 1937)
- Ellis, C H, Ph D Labs of Gordon A Alles, 770 S Arroyo Parkway, Pasadena 5, Calif *Research Assoc in Physiology* (1, 1947)
- Ellis, Fred W, Ph D Univ of North Carolina, Chapel Hill *Assoc Prof of Pharmacology* (3, 1945)
- Ellis, Lillian N, Ph D Adelphi College, Garden City, Long Island, N Y *Instn in Chemistry* (5, 1940)
- Ellis, Max Mapes, Ph D Univ of Missouri Med School, Columbia *Prof of Physiology and Pharmacology* (1, 1923)
- Ellis, N R, M S U S Dept of Agriculture, Bureau of Animal Industry, Beltsville, Md *Asst Chief, Animal Husbandry Div* (2, 1928, 5, 1933)
- Ellis, Sidney, Ph D Temple Univ Med School, Dept of Pharmacology Philadelphia, Pa *Assoc Prof* (3, 1947)
- Elmadjian, Fred, Ph D Worcester State Hospital, Worcester, Mass *Staff Member, Worcester Foundation for Exper Biology, Research Assoc, Physiology Dept, Tufts Med School* (1, 1950)
- Elrod, Ralph P, Ph D 406 Med General Lab, APO 500, % Postmaster, San Francisco, Calif (6, 1947)
- Elser, William J, M D Kent, Conn (6R, 1920)
- Elvehjem, Conrad Arnold, Ph D Univ of Wisconsin, Biochemistry Bldg, Madison *Chairman, Dept of Biochemistry, Dean of Grad School* (2, 1931, 5, 1933)
- Embree, Norris Dean, Ph D Distillation Products, Inc, 755 Ridge Rd W, Rochester 13, N Y *Dir of Research* (2, 1946)
- Emerson, George A, Ph D Univ of Texas, Med Branch, Galveston *Prof of Pharmacology* (3, 1935)
- Emerson, Gladys A, Ph D Merck Inst of Therapeutic Research, Rahway, N J *Nutritionist* (5, 1942)
- Emerson, Oliver H, Ph D U S Dept of Agriculture, Western Regional Research Lab, Albany 6, Calif *Assoc Chemist* (2, 1938)
- Emery, Frederick E, D V M, Ph D Univ of Arkansas School of Medicine, Little Rock *Prof of Physiology and Pharmacology* (1, 1930)
- Emmatt, Emily W, Ph D Natl Insts of Health, Bethesda 14, Md *Cytologist* (3, 1947)
- Enders, John F, Ph D Harvard Univ Med School, Dept of Bacteriology, Boston, Mass *Assoc Prof of Bacteriology and Immunology, Chief, Research Div of Infectious Diseases, Children's Hospital* (6, 1936)
- Endicott, Kenneth M, M D USPHS, Natl Insts of Health, Bethesda 14, Md *Chief of Section on Metabolic and Degenerative Disease* (4, 1947)
- Engel, Frank L, M D Duke Univ School of Medicine, Durham, N C *Asst Prof of Medicine* (1, 1947)
- Engel, Lewis L, Ph D, Massachusetts General Hospital, Huntington Labs, Boston *Research Assoc in Biological Chemistry, Harvard Med School, Tutor in Biological Sciences, Harvard Univ* (2, 1949)
- Engel, Ruben W, Ph D Alabama Polytechnic Inst, Lab of Animal Nutrition, Auburn *Animal Nutritionist* (5, 1948)
- Engle, Earl Theron, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City *Prof of Anatomy* (1, 1930)
- English, James, Jr, Ph D Yale Univ, Sterling Chemistry Lab, New Haven, Conn *Asst Prof of Chemistry* (2, 1946)
- Enright, John B, Ph D Univ of California, School of Veterinary Medicine, Davis *Super vising Bacteriologist* (6, 1948)
- Epstein, Albert A, M D 1111 Madison Ave, New York City *Physician, Beth Israel Hospital and Hospital for Joint Diseases* (2, 1912)
- Ercoli, N, M D, Ph D Warner Inst for Therapeutic Research, New York City 11 *Dir of Pharmacological Research* (3, 1947)
- Erickson, Cyrus C, M D Univ of Tennessee, Inst of Pathology, Memphis 3 *Prof of Pathology* (4, 1941)
- Erickson, John Otto, Ph D Veterans Admin Center, Radioisotope Lab, Wilshire and Sawtelle Blvds, Los Angeles 25, Calif *Radioisotope Scientist* (6, 1946)
- Erlanger, Joseph, M D, Sc D Washington Univ School of Medicine, St Louis, Mo *Prof Emeritus of Physiology* (1R, 1901)
- Ershoff, Benjamin H, Ph D 1207 S Vermont Ave, Los Angeles 6, Calif *Research Assoc, Dept of Biochemistry and Nutrition, Univ of Southern California, Dir of Research, Emory W Thurston Labs, Los Angeles* (5, 1950)
- Eschenbrenner, Allen B, M D Natl Insts of

- Health, Natl Cancer Inst, Bethesda 14, Md (4, 1946)
- Espe, Dwight L, Ph D U S D A, Office of Exper Stations, Washington 25, D C (1, 1940)
- Essex, Hiram E, Ph D Mayo Foundation, Inst of Exper Medicine, Rochester, Minn *Prof of Physiology* (1, 1932, 3, 1940)
- Ettinger, C H, M D, C M Queen's Univ, Kingston, Ontario, Canada *Prof of Physiology, Asst Dir, Div of Med Research, Natl Research Council, Ottawa* (1, 1943)
- Evans, Earl Alison, Jr, Ph D Univ of Chicago, Dept of Biochemistry, Chicago, Ill *Prof and Chairman of Dept* (2, 1939)
- Evans, Everett Idris, M D, Ph D Med College of Virginia, Richmond *Prof of Surgery, Dir, Lab of Surgical Research* (1, 1935)
- Evans, Gerald Taylor, M D, Ph D Univ of Minnesota Hospitals, Minneapolis *Dir of Lab Service, Assoc Prof of Medicine, Univ of Minnesota* (1, 1942)
- Evans, Herbert M, M D Univ of California, Berkeley *Prof of Anatomy and Dir of Inst of Exper Biology* (1, 1919)
- Evans, Titus C, Ph D State Univ of Iowa, College of Medicine, Iowa City *Research Prof, Head of Radiation Research Lab* (1, 1949)
- Eveleth, D F, Ph D, D V M North Dakota Agricultural College, Fargo *Prof of Veterinary Science, North Dakota Agricultural Exper Station* (2, 1939)
- Everett, Guy M, Ph D Abbott Labs, Research Div, N Chicago, Ill *Sr Pharmacologist* (3, 1950)
- Everett, Mark R, Ph D Univ of Oklahoma School of Medicine, 800 N E 13th St, Oklahoma City 4 *Dean, School of Medicine, Supt of Univ Hospitals* (2, 1929)
- Eversole, Wilburn J, M Sc, Ph D Syracuse Univ, Rm 27, Lyman Hall, Syracuse 10, N Y *Assoc Prof of Zoology* (1, 1950)
- Everson, Gladys, Ph D Iowa State College, Ames *Assoc Prof of Nutrition* (5, 1948)
- Ewing, P L, Ph D Univ of Texas School of Medicine, Galveston *Assoc Prof of Pharmacology* (3, 1938)
- Eyster, John A English, M D Univ of Wisconsin, Madison *Prof of Physiology* (1, 1906, 3R, 1908)
- Fahr, George, M D Univ of Minnesota, 102 Millard Hall, Minneapolis *Prof of Clin Medicine* (1, 1913, 3, 1940)
- Failey, Crawford F, Ph D 416 S 6th St, Terre Haute, Ind *Prof of Biochemistry, Univ of Chicago* (2, 1933)
- Fairhall, Lawrence T, Ph D USPHS, Washington, D C *Scientist Dir* (2, 1924)
- Falk, Carolyn R, B A 40 E 66th St, New York City *Bacteriologist, Bureau of Labs, Dept of Health* (6, 1943)
- Falk, K George, Ph D Lab of Industrial Hygiene, Inc, 254 W 31st St, New York City 1 *Director* (2, 1913)
- Famulener, Lemuel W, Ph D, M D 275 Engle St, Englewood, N J (6R, 1920)
- Farah, Alfred E, M D Univ of Washington School of Medicine, Seattle *Assoc Prof of Pharmacology* (3, 1948)
- Farber, Sidney, M D Harvard Med School, 25 Shattuck St, Boston, Mass *Asst Prof of Pathology* (4, 1934)
- Farmer, Chester J, A.M Northwestern Univ Med School, 303 E Chicago Ave, Chicago, Ill *Prof of Chemistry* (2, 1935)
- Farr, Lee E, M D Brookhaven Natl Lab, Upton, L I, N Y *Chairman, Med Dept, Dir, Dept of Med Sciences, Physician-in-Chief, Brookhaven Natl Lab Hospital* (4, 1941)
- Farrar, George E, Jr, M D Wyeth Inc, 1600 Arch St, Philadelphia 3, Pa *Med Dir* (3, 1947)
- Farrell, James L, Ph D, M D 636 Church St, Evanston, Ill (1, 1938)
- Fassett, David W, M D Eastman Kodak Co, Lab of Industrial Medicine, Kodak Park Works, Rochester, N Y *Dir of Lab* (3, 1942)
- Faulconer, Albert, Jr, M D Mayo Clinic, Rochester, Minn *Consultant in Anesthesiology* (3, 1950)
- Fay, Marion, Ph D Woman's Med College of Pennsylvania, Philadelphia 29 *Dean, Prof of Physiological Chemistry* (2, 1937)
- Featherstone, Robert M, Ph D State Univ of Iowa, College of Medicine, Iowa City *Assoc Prof of Pharmacology* (3, 1947)
- Feigen, George A, Ph D Stanford Univ, Dept of Physiology, Stanford, Calif *Instructor* (1, 1948)
- Feinstein, Robert N, Ph D Univ of Chicago, Toxicity Lab, 930 E 58th St, Chicago 37, Ill *Asst Prof, Dept of Biochemistry* (2, 1950)
- Feldman, Harry A, M D 704 Crawford Ave, Syracuse 10, N Y *Assoc Prof of Medicine* (6, 1943)
- Feldman, William H, D V M, M S, D Sc Mayo Foundation, Rochester, Minn *Prof in the Div of Exper Surgery and Pathology* (4, 1934)
- Fell, Norbert, Ph D 1880 N W 28th St Miami, Fla (6, 1944)
- Feller, A E, M D Western Reserve School of Medicine, Cleveland 6, Ohio *Assoc Prof of Preventive Medicine* (6, 1943)
- Fellows, Edwin J, Ph D Temple Univ School of Medicine, Philadelphia, Pa *Asst Prof of Pharmacology* (3, 1939)
- Felsenfeld, Oscar, M D, D T M & H Heiktoen

- Research Inst , 629 South Wood St , Chicago 12, Ill *Dir of Bacteriology* (6, 1949)
- Felton, Lloyd D**, M D , D Sc USPHS, Natl Insts of Health, Bethesda, Md *Med Dir* (6, 1926)
- Fenn, Wallace Osgood**, Ph D Univ of Rochester School of Medicine and Dentistry, 260 Crittenden Blvd , Rochester, N Y *Prof of Physiology* (1, 1924)
- Fenning, Con**, M D Univ of Utah School of Medicine, Salt Lake City *Prof of Pharmacology and Physiology* (1, 1942)
- Fenton, P F**, Ph.D Brown Univ , Providence, R I *Assoc Prof of Biology* (1, 1947, 5, 1949)
- Ferguson, Frederick P**, Ph D Univ of Maryland School of Medicine, Dept of Physiology, Baltimore 1 (1, 1949)
- Ferguson, James Kenneth Wallace**, M A , M D 76 Kilbarry Rd , Toronto, Ont , Canada *Prof of Pharmacology, Univ of Toronto* (1, 1933, 3, 1941)
- Ferguson, John**, Ph D Creighton Univ School of Medicine, Omaha 2, Neb *Asst Prof of Physiology* (1, 1949)
- Ferguson, John Howard**, M A , M D Univ of North Carolina School of Medicine, Dept of Physiology, Chapel Hill *Prof of Physiology and Acting Prof of Pharmacology* (1, 1933)
- Ferguson, L Kraeer**, M D 133 S 36th St , Philadelphia 4, Pa *Prof of Surgery, Grad School, Univ of Pennsylvania, Surgeon, Doctors' Hospital and Woman's Med College, Philadelphia General Hosp* (4, 1935)
- Ferguson, Ralph L**, M D 606 Porter St , Joplin Mo (4, 1949)
- Ferry, John Douglass**, Ph D Univ of Wisconsin, Madison *Prof of Chemistry* (2, 1941)
- Ferry, Ronald M**, M D 966 Memorial Drive, Cambridge, Mass *Assoc Prof of Biochemistry and Tutor in Biochem Sciences, Harvard Univ , Master of Winthrop House* (2, 1924)
- Fetcher, Edwin S**, Ph D Steamboat Springs, Colo (1, 1944)
- Fetter, Dorothy**, Ph D Brooklyn College, Dept of Hygiene, Brooklyn, N Y *Instr in Physiology* (1, 1944)
- Fevold, Harry L**, Ph D Quartermaster Food and Container Inst , 1849 W Pershing Rd , Chicago 9, Ill *Chief, Food Research Div* (2, 1942)
- Field, John, II**, Ph D Navy Dept Office of Naval Research, Med Sciences Div , Washington, D C *Head of Ecology Branch* (1, 1930)
- Fincke, Margaret L**, Ph D Oregon State College, Corvallis *Prof and Head of Dept of Foods and Nutrition, Dept of Home Economics* (5, 1940)
- Findley, Thomas, Jr**, M D Ochsner Clinic, 3503 Prytanis, New Orleans, La *Head of Dept of Internal Medicine, Asst Prof of Clin Medicine, Tulane Univ School of Medicine* (1, 1938)
- Finerty, John C**, Ph D Univ of Texas Med Branch, Galveston *Assoc Prof of Anatomy* (1, 1947)
- Finland, Maxwell**, M D Boston City Hospital, Boston, Mass *Asst Prof of Medicine, Harvard Med School* (6, 1941)
- Finnegan, J K**, Ph D Med College of Virginia, Richmond 19 *Assoc Prof of Pharmacology* (3, 1947)
- Finor, Warfield Monroe**, M D Johns Hopkins Hospital, Baltimore, Md *Assoc Prof of Surgery, Johns Hopkins Univ* (1, 1932)
- Fischel, Edward E**, M D , D.Med Sc 23 Haven Ave , New York City 32 *Fellow in Medicine, Columbia Univ* (6, 1948)
- Fischer, Ernst**, M D Med College of Virginia, Richmond *Prof of Physiology* (1, 1936)
- Fischer, Hermann O L**, Ph D Univ of California, Virus Lab , Forestry Bldg , Berkeley 4 *Lecturer, Dept of Biochemistry* (2, 1940)
- Fischer, Martin H**, M D Univ of Cincinnati College of Medicine, Eden Ave , Cincinnati 19, Ohio *Prof of Physiology* (1, 1901, 2, 1919)
- Fishberg, Ella H**, M A , M D Beth Israel Hospital, Stuyvesant Park E , New York City *Biochemist* (2, 1931)
- Fisher, Albert Madden**, Ph D Univ of Toronto, Connaught Med Research Labs , Toronto 5, Ont , Canada *Asst Dir* (2, 1944)
- Fisher, Kenneth C**, Ph D Defense Research Northern Lab , Fort Churchill, Manitoba, Canada *Superintendent* (1, 1940)
- Fishman, William H**, Ph D Tufts College Med School, 30 Bennet St , Boston 15, Mass *Research Prof of Biochemistry* (2, 1947)
- Fiske, Cyrus H**, M D Harvard Med School, Boston, Mass *Prof of Biological Chemistry* (2, 1914)
- Fitzgerald, Mabel P**, 54 A George Sq , Edinburgh, Scotland (1R, 1913)
- Fitzhugh, O Garth**, Ph D Federal Security Agency, Food and Drug Admin , Div of Pharmacology, Washington, D C *Chief, Chronic Toxicity Branch* (3, 1940)
- Fleischmann, Walter**, M D , Ph D V A Hospital, Fort Howard, Md *Dr , Sr Grade, Instr in Pediatrics, Johns Hopkins Univ* (1, 1940)
- Fleisher, Moyer S**, M D Jewish Hospital, St Louis, Mo *Research Bacteriologist* (4, 1924, 6, 1932)
- Flexner, Louis B**, M D Carnegie Labs , Carnegie Inst of Washington, Wolfe and Madison Sts , Baltimore 5, Md *Staff member, Dept of Embryology* (1, 1933, 2, 1948)
- Flick, John A** Univ of Pennsylvania School of Medicine, Dept of Bacteriology, Philadelphia 4 *Asst Prof of Bacteriology* (6, 1949)

- Flock, Eunice V**, Ph D Mayo Clinic, Rochester, Minn *Assoc Prof in Exper Medicine, Mayo Foundation, Univ of Minnesota* (2, 1940)
- Florman, Alfred L**, M D Mt Sinai Hospital, New York City *Investigator in Virology* (6, 1942)
- Flosdorf, Earl W**, Ph D Forest Grove, Pa *Dir of Research, F J Stokes Machine Co, Philadelphia* (6, 1941)
- Floyd, Cleveland**, M D, Sc D 246 Marlborough St, Boston, Mass *Chief Examiner, Boston Health Dept* (6, 1916)
- Foa, Piero Pio**, Ph D 710 S Wolcott St, Chicago, Ill *Assoc Prof of Physiology and Pharmacology, Chicago Med School* (1, 1944)
- Folch, Jordi**, M D McLean Hospital, Waverly, Mass *Asst Prof of Biological Chemistry, Harvard Med School, Dir of Scientific Research, McLean Hospital* (2, 1941)
- Folkers, Karl**, Ph D Merck and Co, Inc, Rahway, N J *Dir of Organic and Biochemical Research* (2, 1947)
- Follensby, Edna M**, Ph D 80 E Concord St, Boston, Mass *Research Asst, Evans Memorial, Special Instr in Biology, Simmons College* (6, 1933)
- Follis, Richard H, Jr**, M D Johns Hopkins Univ School of Medicine, Baltimore, Md *Assoc Prof of Pathology* (4, 1942)
- Fontaine, Thomas Davis**, Ph D U S Dept of Agriculture, Bureau of Agricultural and Industrial Chemistry, Beltsville, Md *Biochemist, Head, Div of Biologically Active Compounds* (2, 1946)
- Foot, Nathan Chandler**, M D Cornell Univ Med College, New York City *Prof Emeritus of Surgical Pathology* (4, 1924)
- Forbes, Alexander, A M**, M D Harvard University, Biological Labs, Divinity Ave, Boston, Mass (1, 1910)
- Forbes, Ernest B**, Ph D State College, Pa *Prof Emeritus of Animal Nutrition* (1R, 1917, 5R, 1935)
- Forbes, Henry S**, M D Harvard Med School, Boston, Mass *Assoc in Neuropathology* (1R, 1931)
- Forbes, John C**, Ph D Med College of Virginia, Richmond *Research Prof of Biochemistry* (2, 1937)
- Forbes, William H**, Ph D Harvard Univ Boston, Mass *Asst Dir, Fatigue Lab, Asst Prof of Industrial Physiology* (1, 1943)
- Forman, Carolyn**, M D New York Hospital, Dept of Pediatrics 525 E 68th St New York City 21 *Research Fellow* (4, 1950)
- Forney, Robert B**, Ph D Indiana Univ School of Medicine Indianapolis *Asst Prof of Toxicology* (3, 1950)
- Forsander, C A**, M D Univ College of the West Indies, Dept of Physiology, Kingston, Jamaica, B W I (1, 1950)
- Forster, Francis M**, M D 3800 Reservoir Rd, Washington, D C *Prof and Dir of Dept of Neurology, Georgetown Univ School of Medicine*, (1, 1948)
- Forster, Roy P**, Ph M, Ph D Dartmouth College, Dept of Zoology, Hanover, N H *Professor* (1, 1950)
- Fosdick, Leonard S**, Ph D 311 E Chicago Ave, Chicago, Ill *Prof of Chemistry, Northwestern Univ* (2, 1944)
- Foster, G L**, Ph D Columbia Univ, College of Physicians and Surgeons, 630 W 168th St, New York City *Prof of Biological Chemistry* (2, 1923)
- Foster, Harry E**, M D Fairmont Hotel San Francisco, Calif *Retired Med Dir, Cutter Labs* (6, 1913)
- Foster, Jackson W**, Ph D Univ of Texas, Dept of Bacteriology, Austin 12 *Prof of Bacteriology* (2, 1946)
- Foster, Robert H K**, Ph D, M D St Louis Univ School of Medicine, St Louis, Mo *Prof and Dir of Dept of Pharmacology* (1, 1940, 3, 1944)
- Fothergill, LeRoy D**, M D Camp Detrick, Frederick, Md *Asst Technical Dir* (6, 1936)
- Fowler, Ward S**, M D Univ of Pennsylvania, Grad School of Medicine, Dept of Physiology and Pharmacology, Philadelphia 4 *Asst Prof of Physiology* (1, 1950)
- Fox, Sidney W**, Ph D Iowa State College, Chemistry Dept, Ames *Prof of Chemistry, Prof in charge, Chemistry Section, Iowa Agricultural Exper Station* (2, 1946)
- Fraenkel, Gottfried S**, Ph D Univ of Illinois, Urbana *Prof of Entomology* (5, 1949)
- Fraenkel-Conrat, Heinz**, M D, Ph D U S Dept of Agriculture, Western Regional Research Lab, Albany 6, Calif *Sr Chemist* (2, 1942)
- Francis, Thomas, Jr**, M D Univ of Michigan School of Public Health, Ann Arbor *Henry Sewall Prof of Epidemiology* (4, 1940, 6, 1930)
- Franke, Florent E**, M D 9 Sylvester Ave, Webster Groves, Mo *Asst Prof of Physiology, St Louis Univ School of Medicine* (1, 1934)
- Frankel, Edward M**, Ph D 214 River Rd, Nyack 9, N Y *Consulting Chemist* (2, 1916)
- Fraps, R M**, Ph D U S Dept of Agriculture, Bureau of Animal Husbandry Beltsville, Md *Sr Physiologist* (1, 1947)
- Fraser, Donald T**, M B, D P H Univ of Toronto, Connaught Labs, Toronto 5, Canada *Prof of Hygiene and Preventive Medicine* (6, 1935)
- Frear, Donald E H**, Ph D Pennsylvania State College Dept of Agricultural and Biological

- Chemistry, State College *Prof of Agricultural and Biological Chemistry* (2, 1946)
- Fredette, Victorian Univ of Montreal, Montreal, Que, Canada *Asst Prof of Bacteriology, Assoc Dir, Inst of Microbiology* (6, 1948)
- Free, Alfred H, Ph D Miles Labs, Inc, Research Lab, Elkhart, Ind *Head of Biochemistry Section* (2, 1946, 5, 1944)
- Freeman, Harry, M D Worcester State Hospital, Worcester, Mass *Internist, Research Service* (1, 1939)
- Freeman, Leslie Willard, Ph D, M D Univ of Indiana, Dept of Surgery, Indianapolis *Asst Prof of Surgery, Dir of Surgical Research* (1, 1944)
- Freeman, Norman E, M D Univ of California Med School, Dept of Surgery, San Francisco 22 (1, 1936)
- Freeman, Smith, M D, Ph D Northwestern Univ School of Medicine, 303 E Chicago Ave, Chicago, Ill *Prof and Chairman of Dept of Exper Medicine* (1, 1937)
- French, Cyrus E, Ph D Pennsylvania State College, State College *Assoc Prof of Animal Nutrition* (5, 1948)
- French, C Stacy, Ph D Carnegie Institution of Washington Stanford Univ, Calif *Dir, Div of Plant Biology* (2, 1946)
- Freund, Jules, M D Public Health Research Inst of the City of New York, New York City *Chief of the Div of Applied Immunology* (6, 1924)
- Frey, Charles N, Ph D Standard Brands Inc, 595 Madison Ave at 57th St, New York City 22 *Dir, Scientific Relations* (5, 1948)
- Fried, Josef, Ph D Squibb Inst for Med Research, New Brunswick, N J *Assoc Member, Div of Organic Chemistry* (2, 1948)
- Friedemann, Theodore E, Ph D Northwestern Univ Med School, 303 E Chicago Ave, Chicago, Ill *Assoc Prof of Physiology* (2, 1925)
- Frieden, Edward H, Ph D Harvard Univ, 16 Divinity Ave, Cambridge 38, Mass *Research Fellow, Dept of Biology, Instr, Dept of Biochemistry* (2, 1950)
- Friedenwald, Jonas S, M A, M D 1212 Eutaw Place, Baltimore 17, Md *Assoc Prof of Ophthalmology, Johns Hopkins Hospital* (1, 1947)
- Friedewald, William F, M D Emory Univ School of Medicine, Atlanta, Ga *Prof of Bacteriology, Assoc Prof of Medicine* (4, 1941)
- Friedgood, Harry B, M D Univ of California Los Angeles *Assoc Clin Prof of Medicine, Pres and Chairman, California Inst of Cancer Research* (1, 1936)
- Friedman, Maurice H, Ph D, M D 2040 Belmont Rd, Washington 9, D C (1, 1929)
- Friedman, Meyer, M D Harold Brunn Inst for Cardiovascular Research, Mt Zion Hospital, 2200 Post St, San Francisco, Calif *Director* (1, 1947)
- Friedman, M H F, Ph D Jefferson Med College of Philadelphia, 1025 Walnut St, Philadelphia, Pa *Assoc Prof of Physiology* (1, 1941)
- Friedman, Nathan B, M D Cedars of Lebanon Hospital, Div of Labs, 4833 Fountain Ave, Los Angeles, Calif *Director* (4, 1942)
- Friedman, Sydney M, M D, Ph.D Univ of British Columbia, Vancouver, B C, Canada *Prof of Anatomy* (1, 1947)
- Friedman, Townsend B Children's Memorial Hospital, Chicago, Ill *Attending Allergist* (6, 1948)
- Frost, Douglas Van Anden, Ph D Abbott Labs, N Chicago, Ill *Head of Nutritional Research* (2, 1946, 5, 1947)
- Fruton, J S, Ph D Yale School of Medicine, 333 Cedar St, New Haven, Conn *Prof of Biochemistry* (2, 1938)
- Fugo, Nicholas W, Ph D Univ of Chicago, Dept of Obstetrics and Gynecology, Chicago, Ill (3, 1944)
- Fuhrman, Frederick A, Ph D Stanford Univ, Stanford Univ, Calif *Asst Prof of Physiology* (1, 1946)
- Fulton, George P, Ph D Boston Univ, Dept of Biology, 675 Commonwealth Ave, Boston, Mass *Asst Prof* (1, 1950)
- Fulton, John Farquhar, Ph D, M D Yale Univ School of Medicine, New Haven, Conn *Sterling Prof of Physiology* (1, 1925)
- Funk, Casimir, D Sc, Ph D 186 Riverside Drive, New York City 24 *Emeritus* 1949 (2, 1921)
- Furchgott, Robert F, Ph D Washington Univ School of Medicine, Euclid Ave and Kings highway, St Louis 10, Mo *Asst Prof of Pharmacology* (2, 1948)
- Furth, Jacob, M D Oak Ridge Natl Lab, Oak Ridge, Tenn *Chief of Pathology Section, Div of Biology* (4, 1932)
- Gaddum, John H, ScD, FRS Univ of Edinburgh, Edinburgh, Scotland *Prof of Pharmacology* (3, 1950)
- Gaebler, Oliver H, Ph D, M D Henry Ford Hospital, Detroit, Mich *Head, Dept of Biochemistry, Edsel B Ford Inst for Med Research* (2, 1927)
- Gaffron, Hans, Ph D Univ of Chicago, Dept of Chemistry, 5747 Ellis Ave, Chicago 37, Ill *Assoc Prof of Biochemistry, Member, Inst of Radio-Biology and Biophysics* (2, 1941)
- Gagge, Adolf Pharo, Ph D Office of The Surgeon General, H Q, U S A F, Washington, D C *Chief, Med Research Division, Lt Col, U S A F* (1, 1939)
- Galambos, Robert, Ph D, M D Psycho Acoustic

- Lab, Cambridge, Mass *Research Fellow, Harvard Univ* (1, 1942)
- Galdston, Morton, M D Goldwater Memorial Hospital, New York Univ Research Service, Welfare Island, New York City 17 *Instr in Medicine, Research Assoc* (1, 1950)
- Gall, Edward A, M D Cincinnati General Hospital, Cincinnati, Ohio *Mary M Emery Prof of Pathology, Univ of Cincinnati College of Medicine* (4, 1941)
- Gallagher, Thomas F, Ph D Sloan-Kettering Inst, 444 E 68th St, New York City 21 *Member* (2, 1932)
- Gallup, Willis D, Ph D Oklahoma Agricultural and Mechanical College, Stillwater *Chemist and Prof of Agricultural Chemistry* (2, 1932)
- Gamble, James L, M.D, S M 33 Edgehill Rd, Brookline, Mass *Prof Emeritus of Pediatrics, Harvard Med School* (2, 1922, 5, 1933)
- Gantt, W Horsley, M D Johns Hopkins Hospital, Phipps Psychiatric Clinic, Baltimore, Md *Assoc in Psychiatry* (1, 1935)
- Garbat, Abraham L, M D 103 E 78th St, New York City *Dir, Med Service, Lenox Hill Hospital, Clin Prof of Medicine, New York Univ Med School* (6, 1913)
- Gardner, Ernest, M D Wayne Univ College of Medicine, 1512 St Antoine St, Detroit 26, Mich *Asst Prof of Anatomy* (1, 1949)
- Garner, Raymond L, Ph D Univ of Michigan Med School, 218 W Med Bldg, Ann Arbor *Asst Prof of Biological Chemistry* (2, 1947)
- Garrey, Walter Eugene, Ph D, M D Vanderbilt Univ School of Medicine, Nashville, Tenn *Prof Emeritus of Physiology* (1R, 1910, 2, 1906)
- Gasser, Herbert S, A.M, M D Rockefeller Inst for Med Research, 66th St and York Ave, New York City *Dir of Labs* (1, 1915, 3, 1924)
- Gassner, Frank X, M S, D V M Colorado A and M College, Fort Collins *Prof of Endocrine Research, Colorado State Exper Station* (1, 1947)
- Gates, Olive, M D Harvard Med School, 25 Shattuck St, Boston, Mass *Assoc Pathologist* (4, 1940)
- Gaunt, Robert, Ph D Syracuse Univ, Syracuse, N Y *Prof and Chairman of Dept of Zoology* (1, 1939)
- Gay, Leslie N, M D 1114 St Paul St, Baltimore, Md *Dir of Allergy Clinic, Johns Hopkins Hospital, Assoc Prof of Medicine, Johns Hopkins Univ* (6, 1927)
- Geiger, Ernest, Ph D 3842 Monteith Dr, Los Angeles 43, Calif *Prof of Pharmacology and Toxicology, Univ of Southern California Med School, Los Angeles, Advisor in Nutrition, Van Camp Seafood Co, Terminal Island* (5, 1950)
- Geiling, E M K, M D, Ph D Univ of Chicago, Chicago 37 Ill *Chairman of Dept of Pharmacology* (1, 1933, 2, 1927, 3, 1925)
- Gelfan, Samuel, Ph D Yale Univ School of Medicine, 333 Cedar St, New Haven 11, Conn *Assoc Prof of Physiology, Dir, Aero-Med Research Unit* (1, 1930)
- Gellhorn, Alfred, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc Prof of Clin Cancer Research, Dept of Medicine* (3, 1946)
- Gellhorn, Ernst, M D, Ph D Univ of Minnesota, Room 116, Med Sciences, Minneapolis *Prof of Neurophysiology* (1, 1930)
- Gemmell, Chalmers L, M D Univ of Virginia Med School, Charlottesville *Prof of Pharmacology* (1, 1928, 2, 1935, 3, 1946)
- Gerard, R W, Ph D, M D Univ of Chicago, Chicago, Ill *Prof of Physiology* (1, 1927)
- Gerheim, Earl B, Ph D Univ of Detroit, Div of Basic Sciences, 630 E Jefferson, Detroit 26, Mich *Asst Prof* (1, 1950, 6, 1950)
- Gersh, Isadore, Ph D Univ of Chicago, Chicago 37, Ill *Assoc Prof of Anatomy* (4, 1947)
- Gerstenberger, Henry John, M D Western Reserve Univ School of Medicine, Cleveland, Ohio *Prof Emeritus of Pediatrics, Dir of Pediatrics, Babies and Children's Hospital* (5R, 1938)
- Gesell, Robert, M D Univ of Michigan, Ann Arbor *Prof of Physiology* (1, 1913)
- Gettler, Alexander O, Ph D New York Univ, 29 Washington Square, New York City *Prof of Chemistry and Toxicology, Toxicologist to Chief Med Examiner's Office* (2, 1916)
- Gey, George Otto, M D Johns Hopkins Univ, Baltimore, Md *Instr in Surgery* (1, 1940)
- Geyer, Robert P, Ph D Harvard School of Public Health, Dept of Nutrition, Boston, Mass *Asst Prof* (5, 1950)
- Gibbard, J, M Sc Dept of Natl Health and Welfare, Ottawa, Ont, Canada *Chief, Lab of Hygiene* (6, 1946)
- Gibbs, Frederick Andrews, M D 723 N Michigan Ave, Suite 610 Chicago, Ill (1, 1935)
- Gibbs, Owen Stanley, M D P O Box 5387, Whitehaven, Memphis 16, Tenn *Dir, Gibbs Med Research Lab* (3, 1930)
- Gibson, Robert Banks, Ph D Univ Hospital, Iowa City, Iowa *Assoc Prof of Biochemistry, State Univ of Iowa* (2, 1906)
- Gies, William John, Ph D Columbia Univ, 632 W 168th St, New York City *Prof of Biological Chemistry* (1R, 1898, 2, 1906, 3R, 1909)
- Gilman, Alfred, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Prof of Pharmacology* (1, 1935, 3, 1934)
- Gilson, Arthur S, Jr, Ph D Washington Univ Med School, St Louis, Mo *Assoc Prof of Physiology* (1, 1927)
- Githens, Thomas S, M D The Cambridge Alden

- Park, Wissahickon and School Lane, Germantown, Philadelphia, Pa (1R, 1915)
- Givens, Maurice H , Ph D Box 5116, Biltmore, N C (1, 1917, 2, 1915)
- Gjessing, Erland C , Ph D Univ of Virginia, Box 1062, Univ Station, Charlottesville Asst Prof of Biochemistry (2, 1948)
- Glaser, O C , Ph D Amherst College, Amherst Mass Prof Emeritus of Biology (1R, 1913)
- Glass, Howard G , Ph D 514 Wesley Ave , Oak Park, Ill (3, 1947)
- Glazko, Anthony J , Ph D Parke, Davis and Co , Research Labs , Detroit 32, Mich Research Biochemist (1, 1942)
- Glick, David, Ph D Univ of Minnesota, 225 Med Sciences Bldg , Minneapolis 14 Prof of Physiological Chemistry (2, 1936)
- Glickman, Nathaniel, MS 8239 Abbot Ave , Miami Beach, Fla (1, 1947)
- Gochenour, William S , Jr , V M D Army Med Center, A M D R G S , Veterinary Div , Washington 12, D C Chief, Dept of Veterinary Bacteriology (6, 1950)
- Goebel, Walther F , Ph D Rockefeller Inst for Med Research, 66th St and York Ave , New York City Member (2, 1929, 6, 1937)
- Goettsch, Marianne, Ph D Univ of Puerto Rico Med School, San Juan Asst Prof of Biochemistry and Nutrition (2, 1933, 5, 1941)
- Goetzl, Franz R , Ph D , M D Permanente Foundation, Dept of Med Research, Oakland 11, Calif Director (1, 1947)
- Gold, Harry, M D Cornell Univ Med College, New York City Prof of Clin Pharmacology, (3, 1927)
- Goldblatt, Harry, M D Cedars of Lebanon Hospital, Los Angeles, Calif Dir , Inst for Med Research (1, 1945, 4, 1927)
- Golden, Alfred, M D Veterans Admin Hosp , Buffalo, N Y Chief of Lab Service, Lecturer in Pathology, Univ of Buffalo Schobl of Medicine (4, 1947)
- Goldfarb, Walter, M D 25 E 86th St , New York City (1, 1938)
- Goldfeder, Anna , D Sc 444 E 52nd St , New York City 22 Sr Biologist in Charge of Cancer Research, Dept of Hospitals, City of New York, Research Assoc , Dept of Biology, New York Univ (1, 1950)
- Goldforb, A J , Ph D College of the City of New York, New York City Prof of Biology (1, 1930)
- Goldie, Horace, M D , D T M 7910 Lynnbrook Drive, Bethesda, Md Research Immunologist, Nail Cancer Inst (6, 1943)
- Goldring, William, M D New York Univ College of Medicine, 477 First Ave , New York City Assoc Prof of Medicine (1, 1939)
- Goldschmidt, Samuel, Ph D Univ of Pennsylvania Med School, Philadelphia Prof of Physiology (1, 1919, 2, 1915)
- Goldsmith, E D , Ph D New York Univ , 477 First Ave , New York City 16 Assoc Prof of Anatomy, Grad School of Arts and Sciences, Assoc Prof of Histology and Research Coordinator, College of Dentistry (1, 1950)
- Goldsmith, Grace A , M D Tulane Univ of Louisiana, New Orleans Asst Prof of Medicine (5, 1943)
- Goldstein, Avram, M D Harvard Med School, Boston, Mass Assoc in Pharmacology (3, 1948)
- Gollan, Frank, M D Antioch College, Fels Research Inst , Fels House, Yellow Springs, Ohio Assoc Prof of Physiology (1, 1950)
- Golub, Orville Joseph, Ph D Bio-Service Labs , Inc , 10717 Venice Blvd , Los Angeles 24, Calif Associate (6, 1944)
- Gomori, George, M D , Ph D Univ of Chicago, Chicago, Ill Prof of Medicine (4, 1948)
- Goodale, Walter T , M D 79 Webster Rd , Weston 93, Mass Research Fellow, Harvard Med School, Asst in Medicine, Peter Bent Brigham Hospital (1, 1949)
- Goodman, Louis Sanford, M S , M D Univ of Utah School of Medicine, Salt Lake City Prof of Pharmacology and Chairman of Dept of Pharmacology (1, 1946, 3, 1937)
- Goodner, Kenneth, Ph D Jefferson Med College, Philadelphia, Pennsylvania Prof of Bacteriology (6, 1932)
- Goodpasture, Ernest William, M D Vanderbilt Univ Med School, Nashville, Tenn Prof of Pathology and Dean (4, 1923)
- Gordon, Albert S , Ph.D New York Univ , Washington Square College of Arts and Sciences, New York City Assoc Prof of Biology (1, 1942)
- Gordon, Francis B , M D Camp Detrick, Chemical Corps, Biology Dept , Frederick, Md Chief of MV Div (4, 1947)
- Gordon, Harry H , M D 4200 E 9th Ave , Denver, Colo Prof of Pediatrics, Univ of Colorado Med School, Pediatrician in Chief, Colorado Gen Hospital (5, 1940)
- Gordon, Irving, M D New York State Dept of Health, Div of Labs and Research, New Scotland Ave , Albany 1 Assoc Med Bacteriologist, Assoc Prof of Medicine and Bacteriology, Albany Med College (6, 1943)
- Gordon, William G , Ph D U S Dept of Agriculture, Eastern Regional Research Lab , Philadelphia 18, Pa Sr Chemist (2, 1939)
- Gortner, Ross Aiken, Jr , Ph D Wesleyan Univ , Shanklin Lab , Middletown, Conn Assoc Prof of Biochemistry (5, 1947)
- Gortner, Willis A , Ph D Pineapple Research Inst of Hawaii, Honolulu, T H Head of Dept of Chemistry (2, 1947)

- Goss, Harold, Ph D Univ of California College of Agriculture, Davis *Prof of Animal Husbandry* (2, 1936, 5, 1933)
- Goth, Andres, M D Southwestern Med College, 2211 Oak Lawn Ave, Dallas 4, Tex *Assoc Prof of Pharmacology* (3, 1947)
- Gottschall, Russell Y, Ph D Michigan Dept of Health, Bureau of Labs, Lansing *Bacteriologist* (6, 1939)
- Goudsmit, Arnoldus, Jr, M D, Ph D 4141 Windsor Rd, Youngstown 7, Ohio (1, 1940)
- Gould, R Gordon, Ph D Presbyterian Hospital, 1753 W Congress St, Chicago 12, Ill *Assoc Attending Biochemist, Assoc Prof of Biological Chemistry, Univ of Illinois College of Medicine* (2, 1949)
- Govier, William M, M D Upjohn Co, Research Div, Kalamazoo 99, Mich *Sr Pharmacologist* (3, 1944)
- Gowdey, Charles W, Ph D Univ of Western Ontario Med School, Dept of Pharmacology, London, Ontario, Canada *Asst Prof* (3, 1950)
- Grabfield, G Philip, M D 27 Forest St, Milton, Mass *Retired* (3, 1923)
- Grady, Hugh G, M D Armed Forces Inst of Pathology, Washington, D C *Scientific Dir, American Registry of Pathology* (4, 1940)
- Graef, Irving, M D New York Univ College of Medicine, New York City *Asst Prof of Clin Medicine* (4, 1941)
- Graham, Claire E, Ph D Wilson Labs, 4221 S Western Ave, Chicago, Ill *Dir of Research* (2, 1948)
- Graham, Clarence H, Ph D Columbia Univ, New York City 27 *Prof of Psychology* (1, 1933)
- Graham, Helen Tredway, Ph D Euclid Ave and Kingshighway, St Louis, Mo *Assoc Prof of Pharmacology, Washington Univ School of Medicine* (1, 1933, 3, 1931)
- Granick, S, Ph D Rockefeller Inst for Med Research, York Ave at 66th St, New York City 21 *Associate, Physical Chemistry* (2, 1949)
- Grant, E Rhoda, Ph D Univ of Illinois Med College, Clinical Science Dept, 1853 West Polk St, Chicago 12, Ill *Researcher in Clin Science* (1, 1949)
- Grant, R Lorimer, Ph D Federal Security Agency, Food and Drug Admin, Div of Pharmacology, Washington 25, D C *Pharmacologist* (2, 1938)
- Grant, Ronald, Ph D Stanford Univ, Dept of Physiology, Stanford, Calif *Asst Prof (Acting)* (1, 1950)
- Grant, Wilson Clark, Ph D Columbia Univ, College of Physicians and Surgeons 630 W 168th St New York City 32 *Asst Prof of Physiology* (1, 1949)
- Grau, Charles R, Ph D Univ of California Div of Poultry Husbandry, Berkeley 4 *Asst Prof of Poultry Husbandry and Asst Poultry Husbandman in Exper Station* (5, 1949)
- Graubard, Mark, Ph D Univ of Minnesota, Dept of Physiology, Minneapolis (1, 1940)
- Grauer, Robert C, M D Allegheny General Hospital, Pittsburgh, Pa *Dir of William H. Singer Memorial Research Lab, Asst Prof of Medicine, School of Medicine, Univ of Pittsburgh* (4, 1941)
- Gray, John S, Ph D, M D Northwestern Univ Med School, 303 E Chicago Ave, Chicago 11, Ill *Prof and Chairman of Dept of Physiology* (1, 1937)
- Gray, M Geneva, Ph D Labs of Arthur D Little Inc, Cambridge, Mass *Dir, Lab of Industrial Toxicity* (3, 1946)
- Gray, Stephen W, Ph D Emory Univ School of Medicine, Emory Univ, Ga *Asst Prof of Anatomy* (1, 1948)
- Graybiel, Ashton, M D U S Naval School of Aviation Medicine and Research, Naval Air Station, Pensacola, Fla *Coordinator of Research* (1, 1948)
- Greaves, J D, Ph D U S Dept of Agriculture, Western Regional Research Lab, 800 Buchanan St, Albany 6, Calif *Biochemist* (2, 1938)
- Greaves, Joseph E, Ph D 3211 S W 10th Ave, Portland 1, Ore (2, 1940)
- Greeley, Paul O, Ph D, M D Univ of Southern California Med School, Univ Park, Los Angeles *Dir, Student Health Service* (1, 1940)
- Green, Arda Alden, M D Cleveland Clinic, Research Div, Euclid and E 93rd St, Cleveland 6, Ohio (2, 1932)
- Green, Daniel M, M D G D Searle Co, Chicago 80, Ill *Dir of Biological Research* (1, 1948, 3, 1942)
- Green, David E, Ph D Univ of Wisconsin, Enzyme Inst, P O Box 2066 Madison 5 *Prof of Enzyme Chemistry* (2, 1941)
- Green, Harold David, M D Wake Forest College, Bowman Gray School of Medicine, Winston-Salem 7, N C *Prof and Dir of Dept of Physiology and Pharmacology* (1, 1936, 3, 1945)
- Green, Robert Holt, Yale Univ School of Medicine, 333 Cedar St, New Haven, Conn *Asst Prof of Medicine* (6, 1949)
- Greenberg, David Morris, Ph D Univ of California, Berkeley 4 *Prof and Chairman, Div of Biochemistry* (2, 1927 5, 1946)
- Greenberg, Louis D, Ph D Univ of California Med Center, 3rd and Parnassus Aves, San Francisco 22 *Assoc Prof of Pathology, Univ of California Med School* (2, 1946)
- Greenberg, Ruven, Ph D Univ of Texas Med Branch Dept of Physiology Galveston *Asst Prof* (1, 1950)
- Greene, Carl Hartlev, Ph D, M D 401 Clinton Ave, Brooklyn 5, N Y *Assoc Prof of Clin*

- Medicine, New York Univ Post-Grad Med School* (1, 1921, 2, 1922, 4, 1924)
- Greene, Harry S N**, M D, C M Yale Univ School of Medicine, Dept of Pathology, New Haven, Conn *Anthony N Brady Prof of Pathology* (4, 1937)
- Greene, James Alexander**, M D Baylor Univ College of Medicine, Buffalo Drive, Houston, Tex *Prof and Chairman of Dept of Internal Medicine and Dean of Clin Faculty* (1, 1939)
- Greene, Ronald R**, M D Northwestern Univ Med School, 303 E Chicago Ave, Chicago, Ill *Instr in Physiology, Instr in Obstetrics and Gynecology* (1, 1941)
- Greengard, Harry**, Ph D, M D Northwestern Univ Med School, 303 E Chicago Ave, Chicago, Ill *Asst Prof of Physiology* (1, 1939)
- Greenstein, Jesse P**, Ph D Natl Cancer Inst, Bethesda, Md *Chief Biochemist* (2, 1935)
- Greenwald, Isidor**, Ph D New York Univ College of Medicine, 477 First Ave, New York City *Prof of Chemistry* (2, 1912, 5, 1933)
- Greenwood, Delbert A**, Ph D Utah State Agricultural College, Box 163, Logan *Prof of Biochemistry* (3, 1950)
- Greep, Roy O**, Ph D Harvard School of Dental Medicine, 25 Shattuck St, Boston 15, Mass *Assoc Prof of Dental Science* (1, 1940)
- Greer, C M**, M S Vanderbilt Univ School of Medicine, Nashville, Tenn *Instr in Chemistry* (3, 1938)
- Gregersen, Magnus I**, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Prof of Physiology* (1, 1933)
- Gregg, Donald Eaton**, Ph D, M D Army Med Dept, Research and Grad School, Army Med Center, Washington 12, D C (1, 1933)
- Gregory, John E**, Hahnemann Med College, Philadelphia, Pa *Prof of Pathology* (6, 1948)
- Gregory, Raymond L**, Ph D, M D Univ of Texas School of Medicine, 1419 24th St, Galveston *Prof of Medicine* (1, 1945)
- Greig, Margaret E**, Ph D Vanderbilt Univ School of Medicine, Nashville 4, Tenn *Assoc Prof in Pharmacology* (3, 1946)
- Greisheimer, Esther M**, Ph D M D Temple Univ Med School, 3400 N Broad St, Philadelphia, Pa *Prof of Physiology* (1, 1925)
- Grenell, Robert G**, Ph D Johns Hopkins Univ, Dept of Biophysics, Baltimore, Md (1, 1945)
- Griffin, A Clark**, Ph D Stanford Univ, Dept of Biochemistry, Stanford, Calif *Asst Prof* (2, 1950)
- Griffin, Angus**, Ph D George Washington Univ School of Medicine, 1335 H St, N W, Washington, D C *Assoc Prof of Bacteriology* (6, 1940)
- Griffith, Fred R, Jr**, Ph D Univ of Buffalo Med School, 24 High St, Buffalo, N Y *Prof of Physiology* (1, 1923, 5, 1933)
- Griffith, Wendell H**, Ph D Univ of Texas Med School, Galveston *Prof and Chairman of Dept of Biochemistry and Nutrition* (2, 1923, 5, 1934)
- Grimson, Keith S**, M D Duke Univ School of Medicine, Durham, N C *Prof of Surgery* (1, 1943, 3, 1949)
- Grindlay, John H**, M D Mayo Clinic, Rochester, Minn (1, 1945)
- Groat, Richard A**, Ph D Wake Forest College, Bowman Gray School of Medicine, Winston-Salem 7, N C *Assoc Prof of Anatomy* (1, 1945)
- Grodins, Fred S**, Ph D, M D Northwestern Univ Med School, 303 E Chicago Ave, Chicago 11, Ill *Assoc Prof of Physiology* (1, 1945)
- Groedel, Franz M**, M D 829 Park Ave, New York City *Research Fellow, Fordham Univ, Biology Dept* (1, 1949)
- Grollman, Arthur**, M D, Ph D Southwestern Med College, 2211 Oak Lawn Ave, Dallas, Tex *Prof of Pharmacology and Medicine* (1, 1928, 3, 1933)
- Gross, Erwin G**, Ph D, M D State Univ of Iowa, Med Labs, Iowa City *Prof of Pharmacology* (1, 1927, 2, 1923, 3, 1927)
- Gross, J**, M D, C M, Ph D Natl Inst for Med Research, The Ridgeway, Mill Hill, London, N W 7, England (1, 1950)
- Gross, Robert E**, M D Children's Hosp, 300 Longwood Ave, Boston 15, Mass *Surgeon in-Chief, Ladd Prof of Children's Surgery, Harvard Med School* (4, 1940)
- Grossman, Morton Irvin**, Ph D, M D Univ of Illinois College of Medicine, Chicago 12 *Assoc Prof of Physiology* (1, 1946)
- Groupé, Vincent**, Ph D Rutgers Univ, Dept of Microbiology, New Jersey Agricultural Experiment Station, New Brunswick *Assoc Prof in Animal Diseases* (6, 1946)
- Grubbs, Robert C**, M Sc, M D Ohio State Univ, Columbus *Assoc Prof of Physiology* (1, 1950)
- Gruber, Charles M.**, M D, Ph D Jefferson Med College, 1025 Walnut St, Philadelphia, Pa *Prof of Pharmacology*, (1, 1914, 3, 1919)
- Gruber, Charles M, Jr**, M D Jefferson Med College Hospital, Philadelphia, Pa *Assoc Prof of Pharmacology* (3, 1948)
- Gruhzit, Oswald M**, M D Parke, Davis and Co, Research Labs, Detroit, Mich *Research in Pathology and Pharmacology* (4, 1928)
- Grundfest, Harry**, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc in Neurology* (1, 1932)
- Gudernatsch, F**, Ph D 41 Fifth Ave, New York City 3 (1, 1930)
- Guerra, Francisco**, M Sc, M D Facultad de Medicina, Univ Nacional de Mexico, Mexico, D F *Prof of Pharmacology* (3, 1947)

- Guerrant, N B , Ph D Pennsylvania State College, State College *Prof of Biological Chemistry* (2, 1934, 5, 1933)
- Guest, George Martin, M S , M D Children's Hospital, Cincinnati 29, Ohio *Prof of Pediatrics, Univ of Cincinnati College of Medicine and Grad School* (2, 1933)
- Guest, Maurice Mason, Ph D Wayne Univ College of Medicine, Detroit 26, Mich *Assoc Prof of Physiology* (1, 1946)
- Gulick, Addison, Ph D 308 Westmount Ave , Columbia, Mo *Prof of Physiological Chemistry, Univ of Missouri* (1, 1915, 5, 1933)
- Gunn, Francis D , M D , Ph D Univ of Utah School of Medicine, Salt Lake City *Prof and Head of Dept of Pathology* (4, 1938)
- Gunsalus, Irwin C , Ph D Univ of Illinois, 362 Noyes Lab , Urbana *Prof of Bacteriology* (2, 1946)
- Gurin, Samuel, Ph D Univ of Pennsylvania School of Medicine, Philadelphia *Prof of Physiological Chemistry* (2, 1938)
- Gustavson, R G , Ph D Univ of Nebraska, Lincoln *Chancellor* (2, 1927)
- Gustus, Edwin L , Ph D Bjorksten Research Lab , 13791 Ave O, Chicago 33, Ill *Vice President* (2, 1934)
- Guterman, Henry S , M D Michael Reese Hospital, Chicago 16, Ill *Asst Dir, Dept of Metabolic and Endocrine Research* (1, 1949)
- Guthrie, Charles Claude, M D , Ph D Univ of Pittsburgh Med School, Pittsburgh, Pa *Prof of Physiology and Pharmacology* (1, 1905, 3, 1909)
- Gutman, Alexander B , M D Columbia Research Service, Welfare Island, New York City 17 *Director* (2, 1947)
- Guttman, Rita M , Ph D Brooklyn College, Brooklyn, N Y *Asst Prof of Physiology* (1, 1946)
- Guyton, Arthur C , M D Univ of Mississippi School of Medicine, Dept of Physiology, University *Chairman, Dept of Physiology* (1, 1949)
- Gyorgy, Paul, M D Univ of Pennsylvania School of Medicine, 3400 Spruce St Philadelphia 4 *Prof of Nutrition* (2, 1938, 5, 1939)
- Haag, Harvey B , M D Med College of Virginia, Richmond *Prof of Pharmacology* (3, 1934)
- Haag, J R , Ph D Oregon Agricultural Exper Station, Corvallis *Chemist* (2, 1947, 5, 1941)
- Haas, Erwin, Ph D Cedars of Lebanon Hospital, Inst for Med Research, 4751 Fountain Ave , Los Angeles 27, Calif *Asst Dir* (2, 1946)
- Haberman, Sol, Ph D Wm Buchanan Blood, Plasma and Serum Center, Baylor Hospital, Dallas, Tex *Chief of Bacteriology and Serology Services* (6, 1944)
- Hadidian, Zareh, Ph D Tufts College Med School, Boston, Mass (1, 1945)
- Hadley, Philip B , Ph D Western Pennsylvania Hospital, Inst of Pathology, Pittsburgh *Chief of Bacteriological Service and Research Bacteriologist* (4R, 1927)
- Hafkenschiel, Joseph H , Jr , M D 1458 Hampstead Rd , Philadelphia 31, Pa *Instr in Medicine, Univ of Pennsylvania School of Medicine* (1, 1950)
- Hafkesbring, H Roberta, Ph D Woman's Med College of Pennsylvania, East Falls, Philadelphia *Prof of Physiology* (1, 1931)
- Haggard, Howard W , M D 4 Hillhouse Ave , New Haven, Conn *Dir of Lab of Applied Physiology, Yale Univ* (1, 1919, 2, 1920)
- Hahn, Paul F , Ph D Meharry Med College, Nashville, Tenn *Dir of Cancer Research Labs , Prof of Exper Oncology* (1, 1946, 4, 1939)
- Haig, Charles, Ph D New York Med College, Fifth Ave at 105th St , New York City *Assoc Prof of Physiology and Biochemistry* (1, 1942)
- Haimovici, Henry, M D , 1148 Fifth Ave , New York City 28 *Assoc Attending Surgeon, Montefiore Hospital* (1, 1950)
- Haist, Reginald E , M D , Ph D Univ of Toronto, Toronto, Ontario, Canada *Prof of Physiology* (1, 1943)
- Halbert, Seymour P , M D Columbia Univ College of Physicians and Surgeons, Dept of Ophthalmology, 630 W 168th St , New York City 32 (6, 1947)
- Haldi, John, Ph D Emory Univ School of Dentistry, Emory University, Ga *Prof of Physiology* (1, 1928)
- Hale, Wm M , M D Brookhaven Natl Lab , Upton, L I , N Y *Head, Div of Bacteriology and Virology, Bacteriologist-in-Chief, Brookhaven Natl Lab Hosp* (4, 1941, 6, 1935)
- Hale, Worth, M D Antrim, N H *Retired* (1R, 1908, 3R, 1908)
- Haley, Thomas J , Ph D 12007 Thermo St , Los Angeles 34, Calif *Chief, Div of Pharmacology and Toxicology, A E Project, Med School, Univ of California* (3, 1949)
- Hall, Charles E , Ph D Univ of Texas, Med Branch, Dept of Physiology, Galveston *Asst Prof* (1, 1949)
- Hall, F G , Ph D Duke Univ School of Medicine, Dept of Physiology and Pharmacology , Durham, N C (1, 1937)
- Hall, George Edward, M D , Ph D Univ of Western Ontario Ottawa Ave and Waterloo St , London, Ontario, Canada *Dean of the Faculty of Medicine* (1, 1938)
- Hall, Victor E , M A , M D Stanford Univ , Stanford University, Calif *Prof of Physiology* (1, 1934)
- Hall, W Knowlton, Ph D Med College of Georgia, Univ Place, Augusta *Assoc Prof of Biochemistry* (2, 1948)

- Hallenbeck, George Aaron**, Ph D , M D Mayo Clinic, Rochester, Minn *Research Assoc* (1, 1946)
- Halliday, Nellie**, Ph D Univ of California School of Medicine, Room 307, Hooper Fndn , San Francisco (5, 1933)
- Halpert, Béla**, M D Veterans Admin Hospital, 2002 Holcombe Blvd , Houston 4, Texas *Chief, Lab Service, Assoc Prof of Pathology, Baylor Univ College of Medicine* (4, 1936)
- Halsey, John T**, M D P O Box 264, Waveland, Miss *Prof Emeritus of Pharmacology, Tulane Univ* (3R, 1929)
- Halstead, Ward C**, Ph D , Univ of Chicago, Dept of Medicine, Chicago, Ill *Assoc Prof of Exper Psychology, Div of Psychiatry* (1, 1942)
- Ham, Arthur W**, M B Univ of Toronto, Toronto 5, Ontario, Canada *Prof of Anatomy in charge of Histology* (4, 1939)
- Hambourger, Walter E**, Ph D , M D G D Searle and Co , P O Box 5110, Chicago, Ill *Chief Pharmacologist* (3, 1934)
- Hamilton, Bengt L K**, M D U S Marine Hospital, Staten Island 4, N Y *Med Dir , USPHS* (2, 1925)
- Hamilton, James B**, Ph D Long Island College of Medicine, Dept of Anatomy, 350 Henry St , Brooklyn 2, N Y (1, 1938)
- Hamilton, Paul B**, M D , Ph D Alfred I duPont Inst , Nemours Foundation, Rockland Rd , Wilmington 99, Del *Chief of Biochemistry* (2, 1946)
- Hamilton, Tom R**, M S , M D Kansas Univ Med Center, Kansas City 3 *Prof of Microbiology and Pathology* (4, 1950)
- Hamilton, Tom S**, Ph D Univ of Illinois, 1513 W Clark St , Champaign *Prof and Chief in Animal Nutrition* (2, 1937, 5, 1938)
- Hamilton, W F**, Ph D Medical College of Georgia, Augusta *Prof of Physiology* (1, 1924)
- Hammitt, Frederick S**, Ph D 493 Commercial St , Provincetown, Mass *Sr Member Emeritus, Lakenau Hospital Research Inst* (1R, 1920, 2, 1917)
- Hammon, William McD**, M D , D P H Univ of Pittsburgh, Pittsburgh, Pa *Prof of Epidemiology, Grad School of Public Health* (4, 1944, 6, 1946)
- Hampel, C W**, Ph D New York Univ -Bellevue Medical Center, New York City *Assoc Prof of Physiology* (1, 1936)
- Hamre, Dorothy**, Ph D Squibb Inst for Med Research, New Brunswick, N J *Research Assoc* (6, 1948)
- Hand, David B**, Ph D New York State Agricultural Exper Station, Geneva *Head, Div of Food Science and Technology and Prof of Biochemistry* (2, 1947)
- Handler, Philip**, Ph D Duke Univ School of Medicine, Durham, N C *Prof of Biochemistry and Nutrition* (2, 1944, 5, 1946)
- Handley, Carroll A**, Ph D Baylor Univ College of Medicine, 1200 M D Anderson Blvd , Houston 5, Tex *Prof and Chairman of Dept of Pharmacology* (3, 1942)
- Haney, Hance F**, Ph D , M D Univ of Oregon Med School, Portland *Asst Prof of Medicine* (1, 1939)
- Hanger, Franklin**, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St , New York City 32 *Assoc Prof of Medicine* (6, 1930)
- Hanke, Martin E**, Ph D Univ of Chicago, Chicago, Ill *Assoc Prof of Biochemistry* (2, 1925)
- Hanke, Milton Theo**, Ph D 7550 S Green St , Chicago, Ill *Research Consultant, Biochemistry and Nutrition* (2, 1919)
- Hanks, John H**, Ph D Harvard Univ Med School, Boston, Mass *Dept of Bacteriology, Bacteriologist of the Leonard Wood Memorial* (6, 1935)
- Hansen, Arild E**, M D Univ of Texas Med School, Galveston *Prof and Chairman of Dept of Pediatrics, Dir of Univ of Texas Child Health Program* (4, 1941, 5, 1942)
- Hanzlik, Paul J**, M D 303 Franklin St , San Mateo, Calif *Prof Emeritus of Pharmacology, Stanford Univ* (1R, 1912, 3R, 1912)
- Hardy, James Daniel**, Ph D Russell Sage Inst of Pathology, 525 E 68th St , New York City *Research Assoc* (1, 1939)
- Hardy, Mary**, D Sc The Brearley School, 610 E 83rd St , New York City *Teacher of Science* (1, 1933)
- Hare, Kendrick**, Ph D Children's Hospital, 219 Bryant St , Buffalo 9, N Y (1, 1938)
- Harford, Carl G**, M D Washington Univ School of Medicine, St Louis, Mo *Asst Prof of Medicine and Preventive Medicine* (6, 1948)
- Harger, R N**, Ph D Indiana Univ School of Medicine, Indianapolis *Prof of Biochemistry and Toxicology, Chairman, Dept of Biochemistry and Pharmacology* (2, 1938, 3, 1949)
- Harkins, Henry N**, Ph D , M D Univ of Washington School of Medicine, Seattle 5 (1, 1942)
- Harmon, Paul M**, Ph D Indiana Univ , Bloomington *Prof of Physiology* (1, 1930)
- Harne, O G** Univ of Maryland School of Medicine, Baltimore *Assoc Prof of Anatomy, Asst to the Dean* (1, 1935)
- Harned, Ben King**, Ph D Lederle Labs , Pearl River, N Y *Assoc Dir , Pharmacology Research* (2, 1931, 3, 1941)
- Harris, Albert H**, M D N Y State Dept of Health, Div of Labs and Research, New Scotland Ave , Albany 1 *Asst Dir for Local Labs* (6, 1937)

- Harris, Albert Sidney, Ph D Baylor Univ College of Medicine, Houston 5, Texas (1, 1939)
- Harris, Milton, Ph D Harris Research Labs, 1246 Taylor St, N W, Washington 11, D C President (2, 1939)
- Harris, Paul N, M D Eli Lilly and Company, Indianapolis, Ind *Pathologist, Div of Pharmacology* (3, 1948)
- Harris, Philip L, Ph D Distillation Products, Inc, 755 Ridge Rd W, Rochester 13, N Y Head of Biochemistry Research Dept, Assoc in Physiology, Univ of Rochester School of Medicine and Dentistry (2, 1946, 5, 1945)
- Harris, Robert S, Ph D Massachusetts Inst of Technology, Cambridge Prof of Nutritional Biochemistry (5, 1941)
- Harris, S C, Ph D Northwestern Univ Dental School, Dept of Pharmacology, 311 E Chicago Ave, Chicago 12, Ill Assoc Prof and Chairman of Dept (1, 1947)
- Harris, T N, M D Children's Hospital of Philadelphia, Philadelphia, Pa Assoc in Pediatrics, Univ of Pennsylvania (6, 1946)
- Harris, William H, M D Tulane Univ School of Medicine, New Orleans, La Assoc Prof of Pathology (4, 1925)
- Harrison, Frank, Ph D Univ of Tennessee College of Medicine, Memphis Prof and Chief, Div of Anatomy (1, 1941)
- Harrison, James A, Ph D Temple Univ, Philadelphia 22, Pa Prof of Biology (6, 1946)
- Harrison, Ross Granville, M D, Ph D Osborn Zoological Lab, New Haven, Conn Sterling Prof Emeritus of Biology, Yale Univ (1, 1906)
- Harrison, R Wendell, M D, Ph D Ellis Ave at 58th St, Chicago 37, Ill Prof of Bacteriology, Dean of Faculties and Vice Pres, Univ of Chicago (6, 1934)
- Harrow, Benjamin, Ph D College of the City of New York, Convent Ave and 139th St, New York City Prof of Chemistry (2, 1927)
- Hart, E B, B S Univ of Wisconsin Agricultural College, Madison Prof of Biochemistry (2, 1910, 5, 1933)
- Hart, E Ross, Ph D Med Div, Army Chemical Center, Md Toxicologist (3, 1944)
- Hart, William M, Ph D Temple Med School, Broad and Ontario Sts, Philadelphia 40, Pa Asst Prof of Physiological Chemistry (1, 1945)
- Hartline, H K, M D Johns Hopkins Univ, Dept of Biophysics, Baltimore 18, Md (1, 1929)
- Hartman, Carl G, Ph D Ortho Research Foundation, Raritan, N J Dir of Physiology (1, 1921)
- Hartman, Frank Alexander, Ph D Ohio State Univ, Dept of Physiology, Columbus Research Prof of Physiology (1, 1916)
- Hartman, F W, M D Henry Ford Hospital, Detroit, Mich Pathologist (4 1927)
- Hartmann, Alexis F, M D 500 S Kingshighway, St Louis, Mo Prof of Pediatrics, Washington Univ School of Medicine (2, 1932)
- Hartroft, Walter Stanley, M D, Ph D Univ of Toronto, Banting Inst, Toronto 5, Ontario, Canada Assoc Prof (4, 1950)
- Harvey, A McGhee, M D Johns Hopkins Hospital, Baltimore 5, Md Physician-in-Chief, Prof of Medicine, Johns Hopkins Univ Med School (1, 1946, 3, 1946)
- Harvey, E Newton, Ph D Princeton Univ, Guyot Hall, Princeton, N J Henry Fairfield Osborn Prof of Biology (1, 1914, 2, 1916)
- Hass, George, M D Presbyterian Hospital of Chicago, Chicago, Ill Prof and Chairman of Dept of Pathology, Univ of Illinois College of Medicine (4, 1939)
- Hassid, William Z, Ph D, Univ of California, Berkeley Prof of Plant Biochemistry (2, 1946)
- Hastings, A Baird, Ph D Harvard Med School, 25 Shattuck St, Boston 15, Mass Hamilton Kuhn Prof of Biological Chemistry (1, 1927, 2, 1921, 5, 1940)
- Hathaway, Millicent L, Ph D Agricultural Research Administration, Bureau of Human Nutrition and Home Economics, Food and Nutrition Div, Washington 25, D C (5, 1945)
- Hauck, Hazel M, Ph D Cornell Univ, Ithaca, N Y Prof of Home Economics (5, 1941)
- Hauge, Siegfried M, Ph D Purdue Univ Agricultural Exper Station, Lafayette, Ind Research Assoc in Biochemistry (5, 1933)
- Haurowitz, Felix, M D, D Sc Indiana Univ, Bloomington Prof of Chemistry (2, 1949, 6, 1948)
- Haury, Victor G, M D Box 206, Wellsville, Kansas Private Practice in Medicine (3, 1939)
- Haven, Frances L, Ph D Univ of Rochester School of Medicine and Dentistry, 260 Crittenden Blvd, Rochester, N Y Assoc in Biochemistry (2, 1941)
- Hawk, Philip B, Ph D Food, Drug and Cosmetic Consultants, 4818 33rd St, Long Island City, N Y Pres of Food Research Labs, Inc (1, 1903, 2, 1906)
- Hawkins, J E, Jr, Ph D Merck Inst for Therapeutic Research, Rahway, N J Physiologist (1, 1943)
- Hawkins, William Bruce, M D Univ of Rochester School of Medicine and Dentistry, 260 Crittenden Blvd, Rochester, N Y Assoc Prof of Pathology (4, 1933)
- Hawley, Estelle E, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y Research Fellow in Pediatrics (5, 1935)
- Hawn, Clinton van Zandt, M D Marv Imogene Bassett Hospital, Cooperstown, N Y Pathologist, Dir of Otsego County Labs (4, 1948)

- Hay, Eleanor Clarke, Ph D 7 Greenhill Rd , Madison, N J (1, 1945)
- Hayman, J M , Jr , M D Lakeside Hospital, Cleveland, Ohio *Prof of Medicine, Western Reserve Univ* (1, 1928, 3, 1932)
- Haynes, Florence W , Ph D Harvard Med School, 25 Shattuck St , Boston, Mass *Research Assoc in Medicine* (1, 1937)
- Hays, Edwin Everett, Ph D Armour Labs , 1425 W 42nd St , Chicago 9, Ill *Dir of Biochemical Research* (2, 1946)
- Hays, Harry W , Ph D Wayne Univ College of Medicine, 1512 St Antoine St , Detroit 26, Mich *Assoc Prof of Pharmacology* (3, 1949)
- Haywood, Charlotte, Ph D Mount Holyoke College, South Hadley, Mass *Prof of Physiology* (1, 1939)
- Hazen, Elizabeth L , Ph D New York State Dept of Health Labs , 339 E 25th St , New York City *Sr Bacteriologist* (6, 1931)
- Hazleton, Lloyd W , Ph D Box 333, Falls Church, Va *Dir , Hazleton Labs* (3, 1944)
- Hechter, Oscar M , Ph D Worcester Foundation for Exper Biology, 222 Maple Ave , Shrewsbury, Mass (1, 1945)
- Hegnauer, Albert H , Ph D Boston Univ School of Medicine Boston, Mass *Assoc Prof of Physiology* (1, 1937)
- Hegsted David Mark, Ph D Harvard School of Public Health, Boston, Mass *Prof of Nutrition* (5, 1944)
- Heidelberger, Charles, Ph D Univ of Wisconsin, McArdle Memorial Lab , Madison 6 *Asst Prof , Dept of Oncology* (2, 1950)
- Heidelberger, Michael, Ph D Columbia Univ , 630 W 168th St , New York City 32 *Prof of Immunochemistry, Chemist to the Presbyterian Hospital* (2, 1927, 6, 1935)
- Heilbrunn, Lewis Victor, Ph D Univ of Pennsylvania, Philadelphia *Prof of Zoology* (1, 1930)
- Heim, J William, Ph D 1 Yale Ave , Dayton 6, Ohio *Aero Med Lab , Army Air Forces, Wright Field* (1, 1936)
- Heinbecker, Peter, M D Washington Univ Med School, St Louis, Mo *Assoc Prof of Clin Surgery* (1, 1930)
- Heinle, Robert W , M D Western Reserve Univ , Cleveland, Ohio *Asst Prof of Medicine* (5, 1948)
- Helff, O M , Ph D New York Univ , University Heights, New York City *Assoc Prof of Biology* (1, 1932)
- Hellbaum, Arthur A , Ph D , M D Univ of Oklahoma School of Medicine, Oklahoma City *Prof of Pharmacology* (1, 1937, 3, 1945)
- Hellebrandt, Frances Anna, M D Med College of Virginia, Richmond *Prof of Physical Medicine* (1, 1933)
- Heller, Carl G , M D , Ph D Univ of Oregon Med School, Portland 1 *Assoc Prof of Physiology and Medicine* (1, 1945)
- Heller, Victor G , Ph D Oklahoma A & M College, Stillwater *Head of Dept of Agricultural Chemistry Research* (2, 1935, 5, 1935)
- Hellerman, Leslie, Ph D Johns Hopkins Univ School of Medicine, 710 N Washington St , Baltimore 5, Md *Assoc Prof of Physiological Chemistry* (2, 1935)
- Helmer, Oscar Marvin, Ph D Indianapolis General Hospital, Indianapolis, Ind *Head of Dept of Physiological Chemistry* (2, 1935)
- Hemingway, Allan, Ph D 241 Cecil St , S E , Minneapolis, Minn *Assoc Prof of Physiology, Univ of Minnesota* (1, 1933)
- Henderson, Francis G , M D 740 S Alabama St , Indianapolis 2, Ind *Pharmacologist, Eli Lilly & Co* (3, 1950)
- Henderson, LaVell M , Ph D Univ of Illinois, Urbana *Asst Prof of Chemistry* (2, 1949)
- Hendley, Charles D , Ph D Ohio State Univ , Hamilton Hall, Columbus 10 *Asst Prof of Physiology* (1, 1949)
- Hendrix, Byron M , Ph D Univ of Texas School of Medicine, Galveston *Prof of Biochemistry* (2, 1920)
- Hendrix, James Paisley, M A , M D Duke Hospital, Durham, N C *Asst Prof of Medicine (in charge of Therapeutics), Assoc in Physiology and Pharmacology, Duke Univ School of Medicine* (3, 1942)
- Hendry, Jessie L , M A Div of Labs and Research, New York State Dept of Health, New Scotland Ave , Albany *Sr Bacteriologist* (6, 1938)
- Henle, Werner, M D 1740 Bainbridge St , Philadelphia 46, Pa *Assoc Prof of Virology in Pediatrics* (6, 1938)
- Henry, James P , M A , M Sc Aero-Med Lab , Wright Field, Dayton, Ohio *On leave of absence from the Univ of Southern California, Los Angeles* (1, 1947)
- Henschel, Austin F , Ph D Univ of Minnesota, Minneapolis *Asst Prof of Physiological Hygiene* (1, 1944)
- Hepburn, Joseph Samuel, Ph D , M D Chem D 2045 N Franklin St , Philadelphia 22, Pa *Prof of Chemistry and Research Assoc in Gastroenterology, Registrar, Hahnemann Med College and Hospital* (2, 1915)
- Hepler, Opal E , Ph D , M D Northwestern Univ Med School, 303 E Chicago Ave , Chicago, Ill *Assoc Prof of Pathology* (4, 1939)
- Heppel, Leon A , Ph D , M D Natl Insts of Health, Bethesda 14, Md *Surgeon, USPHS* (2, 1949)
- Herbst, Robert M , Ph D Kedzie Chemical Lab , Michigan State College, East Lansing *Prof of Chemistry* (2, 1938)

- Herget, Carl M , Ph D Med Div , Army Chemical Center, Md *Chief, Biophysics Section* (1, 1948)
- Herrick, C Judson, Ph D 236 Morningside Dr , Grand Rapids 6, Mich *Prof Emeritus of Neurology, Univ of Chicago, Chicago, Ill* (1R, 1907)
- Herrick, Julia F , Ph D Mayo Foundation, Rochester, Minn *Assoc Prof of Exper Medicine* (1, 1933)
- Herrin, Raymond C , Ph D , M D Univ of Wisconsin Med School, Madison *Prof of Physiology* (1, 1932)
- Herrington, Lovic P , Ph D 290 Congress Ave , New Haven, Conn *Assoc Dir , John B Pierce Lab of Hygiene, Research Assoc Prof , Dept of Public Health, Yale Med School* (1, 1942)
- Herriott, Roger M , Ph D Johns Hopkins School of Hygiene and Public Health, 615 N Wolfe St , Baltimore 5, Md *Prof of Biochemistry* (2, 1940)
- Herrmann, George R , Ph D , M D Univ of Texas Med Branch, Galveston *Prof of Medicine* (4, 1925)
- Herrmann, Julian B , Ph B , M D 1185 Park Ave , New York City (3, 1941)
- Herrmann, Louis George, M D Cincinnati General Hospital, Cincinnati 29, Ohio *Attending Surgeon, Assoc Prof of Surgery, Univ of Cincinnati College of Medicine* (4, 1933)
- Hertz, Roy, Ph D , M D Natl Insts of Health, Bethesda 14, Md *Public Health Surgeon (R), Div of Physiology* (1, 1945)
- Hertzman, Alrick B , Ph D St Louis Univ School of Medicine, St Louis, Mo *Prof of Physiology and Dir of Dept* (1, 1925)
- Herwick, Robert P , Ph D , M D American Home Products Corp , 22 E 40th St , New York City *Vice Pres , Whitehall Div* (3, 1938)
- Hess, Charles L , M S , M D 308 Davidson Bldg , Bay City, Mich (1, 1916)
- Hess, Walter C , Ph D Georgetown Med School, 39th St and Reservoir Rd , N W , Washington 7, D C *Prof of Biological Chemistry* (2, 1935)
- Hetherington, Albert W , Ph D School of Aviation Medicine, Randolph Field, Texas (1, 1943)
- Hewetson, Jean Hawks, M D 115 E York St , Biglerville, Pa (5, 1944)
- Hewitt, Earl Albon, Ph D Iowa State College, Ames *Assoc Prof of Veterinary Physiology* (1, 1932)
- Hewston, Elizabeth M , M A 1121 24th St , N W , Apt 300, Washington 7, D C *Chemist, Bureau of Human Nutrition and Home Economics* (5, 1950)
- Heyroth, Francis F , M D , Ph D Univ of Cincinnati, Cincinnati, Ohio *Assoc Prof of Ind Toxicology and Asst Dir , Kettering Lab , Assoc Prof of Biological Chemistry, College of Medicine* (2, 1935)
- Hiatt, Edwin P , Ph D Univ of North Carolina School of Medicine, Chapel Hill *Assoc Prof of Physiology* (1, 1942)
- Hickman, Kenneth C D , Ph D 56 Thackeray Rd , Rochester 10, N Y *Consultant, Arthur D Little, Inc* (2, 1944)
- Hier, Stanley W , Ph D Wilson Labs , 4221 S Western Ave , Chicago 9, Ill *Tech Asst to General Manager* (2, 1950)
- Hiestand, William A , Ph D Purdue Univ , Dept of Biology, Lafayette, Ind *Prof of Physiology* (1, 1947)
- Higgins, George M , Ph D Mayo Clinic, Rochester, Minn *Prof of Exper Biology, Mayo Foundation* (5, 1948)
- Higgins, Harold Leonard, M D 322 Franklin St , Newton, Mass (1, 1914, 5, 1933)
- Highman, Benjamin, M D Natl Insts of Health, Bethesda, Md *Sr Surgeon, Lab of Pathology and Pharmacology* (4, 1947)
- Hill, Edgar S , Ph D Washington Univ College of Dentistry, St Louis, Mo *Assoc Prof of Biological Chemistry and Physiology* (2, 1936)
- Hill, Robert M , Ph D Univ of Colorado Med Center, 4200 E 9th Ave , Denver *Prof of Biochemistry* (2, 1933)
- Hill, Samuel E , Ph D 18 Collins Ave , Troy, N Y *Research Worker, The Behr-Manning Corp* (1, 1934)
- Hilleman, Maurice, Ph D Army Med Center, AMDR & GS, Dept of Virus and Rickettsial Diseases, Washington 12, D C *Med Bacteriologist* (6, 1949)
- Hiller, Alma, Ph D Presbyterian Hospital, 1753 W Congress St, Chicago 12, Ill *Assoc , Rush Dept of Biochemistry* (2, 1929)
- Himwich, Harold E , M D Fallston, Md *Chief, Clin Research Branch, Med Div , Army Chemical Center, Md* (1, 1925)
- Himwich, William A , Ph D Johns Hopkins Univ , Welch Med Library, Baltimore, Md *Med Bibliographer* (1, 1947)
- Hine, Charles H , Ph D , M D Univ of California Med School, Pharmacology and Toxicology Dept , Med Center, San Francisco 22 *Asst Prof* (3, 1947)
- Hines, Harry M , Ph D State Univ of Iowa, Iowa City *Prof of Physiology* (1, 1928)
- Hines, Marion, Ph D Emory Univ Dept of Anatomy, Emory University, Ga *Prof of Exper Anatomy* (1, 1932)
- Hinrichs, Marie, Ph D , M D Southern Illinois Normal Univ , Carbondale *Prof of Physiology, Dir of Student Health Service* (1, 1928)
- Hinsey, Joseph C , Ph D Cornell Univ Med College, 1300 York Ave , New York City *Prof of Anatomy and Dean of the Med College* (1, 1929)
- Hirschmann, Hans, M D , Ph D Lakeside Hospital, Cleveland, Ohio *Asst Prof of Biochem-*

- istry, Dept of Medicine, Western Reserve Univ (2, 1946)
- Hirszfeld, Ludwik**, M D Univ of Wroclaw, Wroclaw, Ul Chaubinskiego 4, Poland *Prof of Microbiology, Dir of Med Microbiology* (6, 1946)
- Hisaw, Frederick L**, Ph D Harvard Univ Biological Labs, Cambridge, Mass *Prof of Zoology* (1, 1932)
- Hitchcock, David I**, Ph D Yale Univ, 333 Cedar St, New Haven 11, Conn *Assoc Prof of Physiology* (2, 1930)
- Hitchcock, Fred A**, Ph D Ohio State Univ, Columbus *Prof of Physiology* (1, 1927, 5, 1933)
- Hitchcock, Philip**, Ph D, M D Med College of Alabama, Dept of Physiology and Pharmacology, Birmingham 5 *Assoc Prof of Pharmacology* (3, 1946)
- Hitchings, George H**, Ph D 50 Primrose Ave, Tuckahoe 7, N Y, *Chief Biochemist, Wellcome Research Labs* (2, 1942)
- Hjort, Axel M**, M D, Ph D P O Box 281, Fern Way, Scarsdale, N Y *Private Research Lab and Practice of Medicine* (2, 1925)
- Hoagland, Hudson**, Ph D 222 Maple Ave, Shrewsbury, Mass *Exec Dir, Worcester Foundation for Exper Biology, Neurophysiologist, Worcester State Hospital* (1, 1932)
- Hobby, Gladys L**, Ph D 11 Bartlett St, Brooklyn 6, N Y *Research Bacteriologist in charge of Biological Control, Chas Pfizer & Co* (6, 1946)
- Hober, Rudolf** 5307 Larchwood Ave, Philadelphia 43, Pa *Visiting Prof of Physiology, Univ of Pennsylvania Med School* (1R, 1936)
- Hoberman, Henry D**, Ph D, M D Yale Univ School of Medicine, Dept of Physiological Chemistry, 333 Cedar St, New Haven 11, Conn *Asst Prof of Physiological Chemistry* (2, 1949)
- Hockett, Robert C**, Ph D Sugar Research Foundation, Inc, 52 Wall St, New York City 5 *Scientific Dir* (2, 1950)
- Hodes, Robert**, Ph D Tulane Univ School of Medicine, Dept of Psychiatry, New Orleans 12, La *Prof of Exper Neurology and Neurophysiology* (1, 1941)
- Hodge, Harold Carpenter**, Ph D Univ of Rochester School of Medicine and Dentistry, 260 Crittenden Blvd, Rochester 7, N Y *Prof of Pharmacology and Toxicology* (2, 1937, 3, 1948)
- Hoefel, Paul F A**, Ph D, M D Neurological Inst of New York, 710 W 168th St, New York City 32 *Assoc Prof of Neurology* (1, 1945)
- Hoff, Ebbe Curtis**, Ph D Med College of Virginia, Richmond 19 *Assoc Prof* (1, 1933)
- Hoff, Hebbel E**, Ph D Baylor Univ College of Medicine, Dept of Physiology, 1200 M D Anderson Blvd, Houston 5, Tex *B F Hambleton Prof and Chairman of the Dept* (1, 1933)
- Hoffman, William Samuel**, Ph D, M D Hektoen Inst for Med Research, 629 S Wood St, Chicago 12, Ill *Dir of Biochemistry, Cook County Hospital* (2, 1935)
- Hofmann, Klaus**, Ph D Univ of Pittsburgh, Dept of Chemistry, Pittsburgh, Pa *Research Prof* (2, 1947)
- Hogan, Albert G**, Ph D Univ of Missouri, 105 Schweitzer Hall, Columbia *Prof of Animal Nutrition* (2, 1916, 5, 1933)
- Hogness, Thorfin R**, Ph D Univ of Chicago, Chicago Ill *Dir, Inst of Radiobiology and Biophysics* (2, 1941)
- Holck, Harald G O**, Ph D Univ of Nebraska, College of Pharmacy, Lincoln *Prof of Pharmacology* (1, 1935, 3, 1938)
- Hollaender, Alexander**, Ph D Oak Ridge Natl Lab, Oak Ridge, Tenn (1, 1947)
- Hollander, Franklin**, Ph D Mount Sinai Hospital, Fifth Ave and 100th St, New York City *Assoc in Physiology, Head, Gastro-enterology Research Lab* (1, 1942, 2, 1932)
- Hollinshead, W Henry**, Ph D Mayo Clinic, Rochester, Minn *Head of Section on Anatomy, Prof of Anatomy, Mayo Foundation* (1, 1949)
- Holm, August**, Sc D E R Squibb & Sons, New Brunswick, N J *Research Assoc* (6, 1946)
- Holman, Ralph Theodore**, Ph D A and M College of Texas, College Station *Assoc Prof of Biochemistry and Nutrition* (2, 1948)
- Holman, Russell Lowell**, M D Louisiana State Univ School of Medicine, New Orleans *Prof of Pathology* (4, 1940)
- Holmes, Arthur Dunham**, Ph D Univ of Massachusetts, Amherst *Research Prof of Chemistry* (2, 1931, 5R, 1933)
- Holmes, Joseph H**, M D, D Med Sc Univ of Colorado School of Medicine, 4200 E Ninth Ave, Denver 7 *Assoc Prof of Medicine* (1, 1947)
- Holmes, Julia O**, Ph D 79 Old Town Rd, Amherst, Mass (2, 1942, 5, 1936)
- Holt, Joseph Paynter**, M D, Ph D Standard Oil Co, Room 2400, 30 Rockefeller Plaza, New York City 20 *Dir of Med Research* (1, 1942)
- Holt, L Emmett, Jr**, M D 477 First Ave, New York City 16 *Prof of Pediatrics, New York Univ College of Medicine* (2, 1930, 5, 1946)
- Hoobler, Icie Macy**, Ph D 660 Frederick St, Detroit 2, Mich *Dir, Research Lab Children's Fund of Michigan* (2, 1925, 5, 1933)
- Hoobler, Sibley W**, M D Univ of Michigan Hospital, Dept of Medicine and Surgery, Ann Arbor *Asst Prof of Medicine* (1, 1949)
- Hooker, Davenport**, Ph D Univ of Pittsburgh School of Medicine, Pittsburgh, Pa *Prof of Anatomy* (1, 1920)
- Hooker, Sanford B**, A M, M D 80 E Concord St, Boston, Mass *Member Evans Memorial* (6, 1918)

- Hoover, Sam R , Ph D 7815 Linden Rd , Philadelphia 18, Pa *Sr Chemist Eastern Regional Research Lab , U S Dept of Agriculture* (2, 1946)
- Hoppe, James O , Ph D Sterling-Winthrop Research Inst , Rensselaer, N Y *Research Assoc in Pharmacology* (3, 1950)
- Hoppert, C A , Ph D Michigan State College, Box 626, East Lansing *Prof of Biological Chemistry* (5, 1935)
- Hopps, Howard C , M D Univ of Oklahoma School of Medicine, 801 E 13th St , Oklahoma City *Prof and Chairman of Dept of Pathology* (4, 1947, 6, 1946)
- Horecker, Bernard L , Ph D Natl Insts of Health, Bethesda 14, Md *Biochemist* (2, 1947)
- Horn, Millard J , Ph D 1811 Varnum St , N E , Washington 18, D C *U S Dept of Agriculture, Chemist* (2, 1949)
- Horowitz, Norman H , Ph D California Inst of Technology, Pasadena *Assoc Prof of Biology* (2, 1946)
- Horsfall, Frank L , Jr , M D C.M Rockefeller Inst for Med Research, 66th St and York Ave , New York City *Member, Physician to the Hospital of the Rockefeller Inst for Med Research* (6, 1937)
- Horton, Richard G , Ph D Med Div , Army Chemical Center, Md *Acting Chief, Toxicology Section* (1, 1948)
- Horvath, Steven M , Ph D State Univ of Iowa School of Medicine, Dept of Physiology, Iowa City (1, 1943)
- Horwitt, M K , Ph D Biochemical Research Lab , Elgin State Hospital, Elgin, Ill *Dir , Asst Prof , Biological Chemistry, Univ of Illinois College of Medicine* (2, 1941, 5 1949)
- Hoskins, R G , Ph D , M D 86 Varick Rd , Waban 68, Mass (1R, 1911)
- Hotchkiss, Rollin D , Ph D Rockefeller Inst for Med Research, 66th St and York Ave , New York City *Assoc Member* (2, 1941)
- Hou, H C , M D % Union Embroidery Co , 22 Wyndham St , Hong Kong, China (5, 1949)
- Houck, C Riley, Ph D Univ of Tennessee Med School, Memphis 3 *Asst Prof in Physiology* (1, 1947)
- Hove, Edwin L , Ph D Alabama Polytechnic Inst , Lab of Animal Nutrition, Auburn *Research Biochemist* (5, 1946)
- Howard, Evelyn, Ph D Johns Hopkins School of Medicine, Baltimore, Md *Asst Prof of Physiology* (1, 1933)
- Howard, John Eager, A B , M D Johns Hopkins Hospital, Baltimore 5, Md *Asst Prof of Medicine* (1, 1946)
- Howard, Marion E , M D 38 Trumbull St , New Haven, Conn *Assoc Clin Prof of Medicine, Yale School of Medicine Assoc Physician New Haven Hospital and New Haven Dispensary* (4, 1939, 6, 1937)
- Howe, Howard A , Ph D Johns Hopkins Univ , 1901 East Madison St , Baltimore 5, Md *Adjunct Prof of Epidemiology* (6, 1949)
- Howe, Paul E , Ph D U S Dept of Agriculture, Bureau of Animal Ind , Washington 25, D C , *Nutrition Consultant* (1, 1913, 2, 1909, 5, 1933)
- Howell, Katherine M , M D 6830 S Merrill Ave , Chicago, Ill *Head of Depts of Bacteriology and Serology* (6, 1940)
- Howell, Stacey F , Ph D Veterans Admin Hospital, Perry Point, Md *Biochemist, Clin Lab* (2, 1940)
- Howland, Joe W , M D , Ph D Strong Memorial Hospital, 260 Crittenden Blvd , Rochester 7, N Y *Asst Prof of Radiation Biology, Univ of Rochester, Chief, Div of Med Services* (1, 1949)
- Hubbard, Roger Sanford, Ph D Univ of Buffalo School of Medicine, 24 High St , Buffalo 2, N Y *Prof of Pharmacology* (1, 1922, 2, 1920)
- Hubbell, Rebecca B , Ph D Connecticut Agricultural Exper Station, New Haven *Asst Biochemist* (2, 1937, 5, 1935)
- Hudack, Stephen Sylvester, M D 180 Fort Washington Ave , New York City *Assoc Prof of Orthopedic Surgery, Columbia Univ* (4, 1933)
- Huddleston, Ora L , M D , Ph D Kabat-Kaiser Inst , 1815 Ocean Front, Santa Monica, Calif *Med Dir* (1, 1936)
- Hueper, Wilhelm C , M D Natl Cancer Inst , Bethesda, Md *Chief, Cancerigenic Studies Section, Chief, Cancerigenic Research Labs* (4, 1940)
- Huf, Ernst G , Ph D , M D 3500 Carolina Ave , Richmond, Va *Assoc Prof of Physiology, Med College of Virginia* (1, 1949)
- Huff, Jesse W , Ph D Sharp & Dohme, Inc , Glenolden, Pa *Dir , Biochemical Research* (2, 1949)
- Huffman, C F , Ph D Michigan State College, East Lansing *Research Prof and Prof in Dairy Husbandry* (5, 1937)
- Huffman, Max N , Ph D Southwestern Med College, 2211 Oak Lawn Ave , Dallas, Tex *Research Prof of Biochemistry* (2, 1947)
- Huggins, Charles Brenton, M D Univ of Chicago, Chicago, Ill *Prof of Surgery* (1, 1932)
- Huggins, Joseph, M D 111 N 49th St , Philadelphia, Pa *Asst Prof of Exper Neurology, Grad School of Medicine, Univ of Pennsylvania, Dir of Lab , Pennsylvania Hospital for Mental Diseases* (1, 1936)
- Huggins, Russell A , Ph D Baylor Univ College of Medicine, 1200 M D Anderson Blvd , Houston 5, Tex *Assoc Prof of Pharmacology* (3, 1949)
- Hughes, Hettie B , Ph D Christ Hospital, Cincinnati 19, Ohio *Research Assoc* (2, 1916)
- Hughes, Josiah Simpson, Ph D Kansas State

- College, Manhattan *Prof of Chemistry* (2, 1931, 5, 1939)
- Hughes, Thomas P , Ph D Johns Hopkins Univ School of Public Health, Baltimore, Md *Member Field Staff, Rockefeller Foundation, New York City* (6, 1934)
- Hulpieu, Harold R , Ph D Indiana Univ School of Medicine, Indianapolis *Prof of Pharmacology* (3, 1939)
- Humphreys, Eleanor M , M D Univ of Chicago, Dept of Pathology, Chicago 37, Ill *Professor* (4, 1950)
- Humphries, James C , Ph D Univ of Kentucky, College of Arts and Science, Lexington *Assoc Prof of Bacteriology* (6, 1950)
- Hundley, James M , M D Natl Insts of Health, Exper Biology and Medicine Inst , Bethesda 14, Md *Chief, Section on Nutrition* (5, 1950)
- Hunscher, Helen A , Ph D Western Reserve Univ , 2023 Adelbert Rd , Cleveland 6, Ohio *Head of Dept of Home Economics* (5, 1934)
- Hunt, Carlton C , M D Wilmer Inst , Johns Hopkins Hospital, Baltimore, Md *Sr Fellow, Natl Research Council* (1, 1950)
- Hunter, Andrew, C B E , M B Hospital for Sick Children, Toronto, Ontario, Canada *Consulting Biochemist, Prof Emeritus of Pathological Chemistry, Univ of Toronto* (2, 1908)
- Hunter, Francis Edmund, Jr , Ph D Washington Univ Med School, St Louis 10, Mo *Asst Prof of Pharmacology* (2, 1946)
- Hunter, George, M A , D Sc 108 Walton Way, Aylesbury, Bucks, England (2, 1924)
- Hunter, Jesse E , Ph D Allied Mills, Inc , 7500 S Adams St , Peoria, Ill *Dir of Research* (5, 1936)
- Hunter, John, Ph D 61 Connaught Ave , Newtonbrook, Ontario, Canada (1, 1948)
- Hussey, Raymond, M D American Med Association, 535 N Dearborn, Chicago 10, Ill *Scientific Dir , Council on Industrial Health* (4, 1927)
- Hutchens, John O , Ph D Univ of Chicago, Dept of Physiology, Chicago 37, Ill *Assoc Prof and Chairman of Dept of Physiology, Dir of Toxicity Lab* (1, 1947)
- Hutchings, Brian L , Ph D Lederle Labs Div , American Cyanamid Co , Pearl River, N Y *Head, Dept of Biochemistry* (2, 1949)
- Hyman, Chester, Ph D Univ of Southern California School of Medicine, Los Angeles *Asst Prof of Physiology* (1, 1948)
- Ingalls, Mabel S , Ph D 1075 Park Ave , New York City 28 *Consultant, World Health Organization, Lake Success* (6, 1940)
- Ingle, Dwight J , Ph D Upjohn Co , Research Labs , Kalamazoo, Mich *Sr Research Scientist* (1, 1939)
- Ingraham, Raymond Clifford, Ph D Univ of Illinois College of Medicine, 1853 W Polk St , Chicago *Asst Prof in Physiology* (1, 1938)
- Ingram, W R , Ph D State Univ of Iowa College of Medicine, Iowa City *Prof and Head of Dept of Anatomy* (1, 1936)
- Irish, Don D , Ph D Dow Chemical Co , Midland, Mich *Dir , Biochemical Research Lab* (3, 1948)
- Irvin, J Logan, Ph D Univ of North Carolina, School of Medicine, Chapel Hill *Assoc Prof Biological Chemistry and Nutrition* (2, 1942)
- Irving, George Washington, Jr , Ph D U S Dept of Agriculture, Bureau of Agricultural and Industrial Chemistry, South Bldg , Washington 25, D C *Asst Chief* (2, 1946)
- Irving, Laurence, Ph D USPHS, P O Box 960, Anchorage, Alaska *Biologist, Alaska Health and Sanitation Activities* (1, 1927)
- Irwin, M R , Ph D Univ of Wisconsin, Madison *Prof of Genetics* (6, 1936)
- Isaacs, Raphael, M A , M D 104 S Michigan Ave , Suite 630, Chicago 3, Ill *Attending Physician, Dept of Hematology, Michael Reese Hospital* (4, 1928)
- Isbell, Harris, M D USPHS Hospital, Lexington, Kv *Dir , Research Div* (3, 1949)
- Isenberger, R M , M A , M D Univ of Kansas School of Medicine, Kansas City *Prof of Pharmacology* (3, 1937)
- Ivy, A C , Ph.D , M D Univ of Illinois, Chicago Professional Colleges, Chicago, Ill *Vice-Pres , Distinguished Service Prof of Physiology* (1, 1919, 5, 1933)
- Iwamoto, Harry K , Ph D Univ of Buffalo, Schools of Medicine and Pharmacy, Dept of Pharmacology, Buffalo 14, N Y (3, 1948)
- Izquierdo, J Joaquin, M D Natl School of Medicine, Mexico City *Prof of Physiology in Natl School of Medicine and the Escuela Medico Militar of Mexico* (1, 1928)
- Jackson, Dennis Emerson, Ph D , M D 144 Louis Ave , Cincinnati 20, Ohio *Prof Emeritus of Pharmacology, Univ of Cincinnati College of Medicine* (1R, 1910, 3R, 1912)
- Jackson, Elizabeth B , A B Army Med Center—AMDR & GS, Dept of Virus and Rickettsial Diseases, Washington 12, D C *Bacteriologist* (6, 1949)
- Jackson, Eugene L , Ph D 1322 W Broad St , Richmond 20, Va *Med Dir , A H Robins Co* (3, 1942)
- Jackson, Richard W , Ph D U S Dept of Agriculture, Northern Regional Research Lab , 825 N University St , Peoria 5, Ill *Head of Fermentation Div* (2, 1930, 5, 1933)
- Jacobs, Merkel Henry, Ph D Univ of Pennsylvania, Philadelphia *Prof of General Physiology* (1, 1919)
- Jacobs, Walter A , Ph D Rockefeller Inst for Med Research, 66th St and York Ave , New

- York City 21 *Member Emeritus* (2, 1908, 3, 1913)
- Jacobsen, Erik**, M D Medicinalco Ltd, Copenhagen S, Denmark *Research Dir* (3, 1950)
- Jacobson, Edmund**, Ph D, M D Lab for Clin Physiology, 55 E Washington St, Chicago, Ill (1, 1929)
- Jaffe, Henry L**, M D Hospital for Joint Diseases, 1919 Madison Ave, New York City *Dir of Labs* (4, 1925)
- Jahn, Theodore Louis**, Ph D Univ of California, Los Angeles 24 *Chairman, Dept of Zoology* (1, 1944)
- Jailer, Joseph W**, Ph D Columbia Univ College of Physicians and Surgeons, New York City *Instr in Medicine* (1, 1948)
- Jamieson, Walter A**, Sc D Green Braes, R.R. 2, Indianapolis, Ind *Dir, Biological Div, Eli Lilly & Co* (6, 1927)
- Jandorf, Bernard J**, Ph D Med Div, Army Chemical Center, Md *Asst Chief, Biochemistry Section* (2, 1946)
- Janes, Ralph G**, Ph D State Univ of Iowa College of Medicine, Iowa City *Assoc Prof of Anatomy* (1, 1948)
- Jansen, Eugene F**, B A Enzyme Research Lab, Western Regional Research Lab, Albany 6, Calif *Sr Chemist, Bureau of Agricultural and Industrial Chemistry, U S Dept of Agriculture* (2, 1947)
- Jaques, L B**, Ph D Univ of Saskatchewan, Saskatoon, Canada *Prof of Physiology* (1, 1943)
- Jasper, Herbert H**, Ph D, D s Sci Montreal Neurological Inst, 3801 University St, Montreal, Quebec, Canada *Lecturer in Neuro-electrography and Dir of Dept of Electrophysiology* (1, 1940)
- Jawetz, Ernest**, Ph D, M D Univ of California Med Center, 3rd and Parnassus Aves, San Francisco 22 *Assoc Prof of Bacteriology, Lecturer in Medicine and Pediatrics* (6, 1950)
- Jeans, P C**, M D Childrens' Hospital, State Univ of Iowa Iowa City *Prof of Pediatrics* (5, 1937)
- Jensen, Hans F**, Ph D Med Dept Field Research Lab, Fort Knox, Ky *Chief Biochemist* (2, 1929)
- Jobling, James W**, M D Suwanee Hotel, St Petersburg, Fla *Prof Emeritus of Pathology, Columbia Univ* (4R, 1913)
- Jochim, Kenneth E**, Ph D Univ of Kansas, Dept of Physiology, Lawrence (1, 1942)
- Johlin, J M**, Ph D Vanderbilt Univ School of Medicine, Nashville, Tenn *Assoc Prof of Biochemistry* (2, 1928)
- Johnson, B Connor**, Ph D Univ of Illinois, Div of Animal Nutrition, 554 Davenport Hall, Urbana *Assoc Prof* (2, 1947, 5, 1947)
- Johnson, Frank H**, Ph D Univ of Utah, Dept of Chemistry, Salt Lake City 1 (1, 1942)
- Johnson, Joseph L**, Ph D, M D Howard Univ School of Medicine, Washington, D C *Prof and Head of Dept of Physiology* (1, 1934)
- Johnson, J Raymond**, Ph D Univ of Ottawa, Faculty of Medicine, Ottawa, Ontario, Canada (1, 1938)
- Johnson, Marvin J**, Ph D Univ of Wisconsin, Biochemistry Bldg, Madison *Prof of Biochemistry* (2, 1941)
- Johnson, Robert E**, M D, Ph D Univ of Illinois College of Liberal Arts and Sciences, Dept of Physiology, Urbana *Head of Dept* (1, 1944, 2, 1939, 5, 1946)
- Johnson, S R**, Ph D Missouri Farmers Assoc Milling Co, Springfield *Dir of Nutrition* (5, 1947)
- Johnson, Victor**, Ph D, M D Mayo Foundation, Rochester, Minn (1, 1933)
- Johnston, Charles G**, M S, M D Wayne Univ College of Medicine, Detroit, Mich *Prof of Surgery* (1, 1933)
- Johnston, Frances A**, Ph D Cornell Univ, Ithaca, N Y *Asst Prof of Foods and Nutrition* (5, 1948)
- Johnston, Margaret W**, Ph D B-452, Univ Hospital, Ann Arbor, Mich *Research Assoc in Internal Medicine* (2, 1930, 5, 1938)
- Jolliffe, Norman**, M D 39 E 75th St, New York City (1, 1932)
- Jones, D Breese**, Ph D 2901 18th St, N W, Washington 9, D C *Retired* (2, 1920, 5R, 1935)
- Jones, Hardin B**, Ph D Univ of California, Div of Med Physics, Berkeley 4 *Asst Prof of Med Physics and Physiology, Asst Dir of Donner Lab* (1, 1949)
- Jones, James H**, Ph D Univ of Pennsylvania School of Veterinary Medicine, Philadelphia 4 *Prof of Physiological Chemistry* (2, 1928, 5, 1933)
- Jones, Kenneth K**, Ph D Northwestern Univ Med School, 303 E Chicago Ave, Chicago, Ill *Assoc Prof of Physiology and Pharmacology* (1, 1936)
- Jones, Ralph, Jr**, M D Univ of Pennsylvania Med School, Philadelphia 4 *Assoc in Medicine* (3, 1950)
- Joseph, Norman R**, Ph D Univ of Illinois, 1853 W Polk St Chicago 12 *Asst Prof of Chemistry* (2, 1947)
- Joslin, Elliott P**, M A, M D, 81 Bay State Rd, Boston, Mass *Dir, George F Baker Clinic* (5R, 1933)
- Jukes, Thomas Hughes**, Ph D Lederle Labs, Pearl River, N Y *Head, Dept of Nutrition and Physiology Research* (2, 1935, 5, 1935)
- Jung, Frederic Theodore**, Ph D, M D American

- Med Assoc, Chicago, Ill Asst Secretary (1, 1930)
- Jungeblut, Claus W, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 Prof of Bacteriology (4, 1929, 6, 1926)
- Kabat, Elvin A, Ph D Columbia Univ College of Physicians and Surgeons, 710 W 168th St, New York City 32 Assoc Prof of Bacteriology (2, 1940, 6, 1943)
- Kabat, Herman, Ph D, M D 2633 16th St, N W, Washington, D C Consultant in Neurology, Health Dept District of Columbia (1, 1941)
- Kahn, Reuben L, Sc D, Univ of Michigan Hospital, Ann Arbor Assoc Prof of Serology of Syphilis and Chief of Serology Lab, (4, 1934, 6, 1919)
- Kalckar, Herman M, M D, Ph D Univ of Copenhagen, Inst f Cell Physiology, 28 Juliane Maries Vej, Copenhagen, Denmark Dir of Inst, Research Prof, Inst f Cell Physiology (2, 1942)
- Kalmitsky, George, Ph D State Univ of Iowa, Iowa City Assoc Prof of Biochemistry (2, 1948)
- Kalter, Seymour Sanford, Ph D Syracuse Univ, College of Medicine, Dept of Bacteriology and Parasitology, Syracuse, N Y Asst Prof, Assoc Bacteriologist, Syracuse Health Dept (6, 1950)
- Kamen, Martin D, Ph D Washington Univ Med School, 510 S Kingshighway, St Louis 10, Mo Assoc Prof of Chemistry (2, 1946)
- Kamm, Oliver, Ph D 365 Lakeshore Drive, Detroit 30, Mich Research Consultant, Parke, Davis and Co (2, 1928)
- Kaplan, Nathan O, Ph D Johns Hopkins Univ, McCallum-Pratt Inst, Baltimore 18, Md Asst Prof of Biology (2, 1949)
- Karel, Leonard, Ph D Natl Insts of Health, Div of Research and Fellowships, Bethesda 14, Md Exec Sec, Hematology and Pharmacology Study Sections (3, 1947)
- Karlson, Alfred G, Ph D, D V M Mayo Foundation, Rochester, Minn Assoc in Exper Pathology (4, 1950)
- Karpovich, Peter V, M D, M P E Springfield College, Springfield, Mass Prof of Physiology (1, 1942)
- Karshan, Maxwell, Ph D Columbia Univ, Dept of Biological Chemistry, 630 W 168th St, New York City 32 Assoc Prof of Biochemistry (2, 1939)
- Karsner, Howard T, M D Dept of the Navy, Bureau of Medicine and Surgery, Research Div, Washington 25, D C Med Research Advisor (4, 1913)
- Katz, Louis Nelson, M A, M D 2900 Ellis Ave, Chicago, Ill Dir of Cardiovascular Research, Michael Reese Hospital, Professorial Lecturer in Physiology, Univ of Chicago (1, 1924)
- Katzman, Philip A, Ph D St Louis Univ School of Medicine, 1402 S Grand Blvd, St Louis 4, Mo Assoc Prof of Biochemistry (2, 1935)
- Kaulbersz, Jerzy, Ph D M D Collegium Medica, Grzegorzeczka 16, Cracow, Poland Prof of Physiology (1, 1944)
- Kaunitz, Hans, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 Research Assoc in Pathology (4, 1947)
- Kazal, Louis Anthony, Ph D Sharp & Dohme, Inc, Med Research Div, Glenolden, Pa Research Biochemist (2, 1947)

- Kuntz, Moses, Ph D Rockefeller Inst for Med Research, 66th St and York Ave , New York City 21 *Member* (2, 1947)
- Kupperman, Herbert S , M D , Ph D New York Univ College of Medicine, Dept of Thera-

- peutics 477 First Ave, New York City *Research Assoc* (3, 1950)
- Kurtz, Alton C, Ph D Univ of Oklahoma Med School, Dept of Biochemistry, Oklahoma City *Assoc Prof* (2, 1942)
- Kuiper, Adrian C, Ph D Wayne Univ College of Medicine, Detroit 26, Mich *Asst Prof of Physiological Chemistry* (2, 1946)
- Kydd, David M, M D Yale Univ School of Medicine, New Haven, Conn *Assoc Prof of Medicine* (5, 1934)
- Kyes, Preston, Sc D, M D North Jay, Maine *Prof Emeritus* (6R, 1918)
- Kyker, Granvil C, Ph D Univ of Puerto Rico, School of Medicine, San Juan *Prof and Head, Dept of Biochemistry and Nutrition* (2, 1947)
- LaBelle, Annette, B A, 271 Alta Vista Dr, Tuckahoe 7, N Y (1, 1948)
- Lackey, Robert W, Ph D Southwestern Med College, Dept of Physiology and Pharmacology, Dallas 4, Texas *Prof of Physiology* (1, 1947)
- Lacorte, Jose G, M D Instituto Oswaldo Cruz, Rio de Janeiro, Brazil, S A *Dir, Virus Section, Oswaldo Cruz Inst* (6, 1946)
- Lacy, G R, M D Univ of Pittsburgh, Pittsburgh, Pa *Prof of Bacteriology and Immunology* (4, 1927)
- Lalich, Joseph J, M D Univ of Wisconsin, 426 N Charter St, Madison 6 *Assoc Prof of Pathology* (4, 1946)
- Lamb, Alvin R, Ph D Hawaiian Sugar Planters' Assoc, Exper Station, Honolulu *Research Assoc* (2, 1923, 5, 1934)
- Lambert, Edward H, Ph D, M D Mayo Foundation, Rochester, Minn *Asst Prof of Physiology* (1, 1945)
- Lambert, Robert A, M D Bricks Springs, Greensboro, Ala *Consultant, Pan American Sanitary Bureau, Regional Office of World Health Organization* (4, 1922)
- Lambertsen, Christian J, M D Univ of Pennsylvania School of Medicine, Philadelphia, Pa *Asst Prof of Pharmacology*, (3, 1948)
- Lampen, J Oliver, Ph D Western Reserve Univ School of Medicine, Cleveland 6, Ohio *Assoc Prof of Microbiology* (2, 1947)
- Lamport, Harold, M D Yale Univ School of Medicine New Haven, Conn *Assoc Prof of Physiology* (1, 1943)
- Lamson, Paul Dudley, M D Vanderbilt Univ Med School, Nashville, Tenn *Prof of Pharmacology* (1, 1921, 3, 1915)
- Lancefield, Rebecca C, Ph D 66th St and York Ave, New York City 21 *Assoc Member, Rockefeller Inst for Med Research* (6, 1933)
- Landis, Carney, Ph D Columbia Univ, Psychiatric Inst, 722 W 168th St, New York City *Principal Research Psychologist and Prof of Psychology* (1, 1939)
- Landis, Eugene Markley, Ph D, M D Harvard Med School, Dept of Physiology, 25 Shattuck St, Boston, Mass *George Higginson Prof of Physiology* (1, 1928)
- Landowne, Milton, M D 6101 Stewart Ave, Baltimore 9, Md *Assoc Chief, Cardiovascular Disease and Gerontology Section, Baltimore City Hospital* (1, 1947)
- Lands, Alonzo, M, Ph D Sterling-Winthrop Research Inst, Rensselaer, N Y *Head, Pharmacology Section* (1, 1942, 3, 1947)
- Lange, Carl, M D 371 Morris St, Albany, N Y *Assoc Bacteriologist, Divs of Labs and Public Health, N Y State Dept of Health* (6, 1938)
- Langley, Wilson D, Ph D Univ of Buffalo Med School, 24 High St, Buffalo, N Y *Prof of Biochemistry* (2, 1937)
- Langworthy, Orthello R, M A, M D Johns Hopkins Hospital, Baltimore, Md *Assoc Prof of Psychiatry, Johns Hopkins Univ* (1, 1928)
- Lanni, Frank, Ph D Duke Univ School of Medicine, Durham, N C *Research Assoc* (6, 1949)
- Lardy, Henry A, Ph D Inst for Enzyme Research, Univ of Wisconsin, Madison 6 *Prof of Biochemistry* (2, 1946)
- Larrabee, Martin G, Ph D Johns Hopkins Univ, Biophysics Dept, Baltimore 18, Md *Assoc Prof* (1, 1940)
- Larsen, Eleanor M, Ph D Univ of Wisconsin, Dept of Physiology, S M I, Madison 6 *Instr in Physiology* (1, 1949)
- Larson, Carl L, M D Natl Insts of Health, Div of Infectious Diseases, Bethesda, Md *Surgeon, USPHS* (6, 1948)
- Larson, Edward, Ph D Med Research, Unit of the Veterans Hospital, Coral Gables, Fla *Prof of Physiology and Pharmacology* (1, 1929, 3, 1937)
- Larson, Hardy W, Ph D Metropolitan Life Insurance Co, Biochemical Lab, 1 Madison Ave, New York City *Research Chemist* (2, 1937)
- Larson, Paul S, Ph D Med College of Virginia, Richmond *Research Prof of Pharmacology* (1, 1939, 3, 1947)
- Lashley, K S, Ph D Yerkes Labs, Orange Park, Fla *Research Prof of Neuropsychology, Harvard Univ, Dir, Yerkes Labs of Primate Biology, Inc* (1, 1923)
- Laskowski, M, Ph D Marquette Univ Med School, Milwaukee 3, Wis *Assoc Prof of Biochemistry* (2, 1944)
- Last, Jules H, Ph D, M D Northwestern Univ Med School, Chicago, Ill *Asst Prof Exper Medicine* (3, 1948)
- Lauffer, Max A, Jr, Ph D Univ of Pittsburgh, Pittsburgh 13, Pa *Research Prof and Head of Dept of Biophysics* (2, 1946)

- Laug, E P**, Ph D Food and Drug Admin, Div of Pharmacology, 12th and C Sts S W, Washington 25, D C *Pharmacologist* (2, 1938, 3, 1947)
- Laurens, Henry D**, Ph D, M D Box 157, Flatrock, N C (1R, 1913)
- Lauson, Henry D**, Ph D, M D, New York Hospital, Dept of Pediatrics, 525 E 68th St, New York City 21 *Associate* (1, 1946)
- Lavine, T F**, Ph D Lankenau Hospital Research Inst, Philadelphia, Pa *Research Chemist* (2, 1938)
- Lawrence, W Sherwood**, M D 906 Hazel St, Gridley, Calif *Physician and Surgeon* (3, 1944)
- Lawson, Hampden**, M D, Ph D Univ of Louisville, Louisville, Ky *Prof of Physiology* (1, 1933)
- Lawton, Alfred H**, M D, Ph D Veterans Admin, Bureau of Medicine and Surgery, Washington, D C *Acting Asst Chief Med Dir* (1, 1949, 3, 1948)
- Leake, Chauncey D**, Ph D Univ of Texas Med Branch, Galveston, *Vice-Pres of Univ of Texas in Charge of Med Program* (1, 1923, 3, 1924)
- Leathem, James H**, Ph D Rutgers Univ, New Brunswick, N J *Prof of Zoology* (1, 1945)
- Leathes, John Beresford**, M A, M B Westfield Ware Lane, Lyme Regis, Dorset, England *Emeritus* (2, 1909)
- Lederer, Ludwig George**, Ph D, M D Pennsylvania Central Airlines, Natl Airport, Washington, D C, *Med Dir* (1, 1940)
- Lee, Douglas H K**, M D Johns Hopkins Univ, I Bowman School of Geography, Baltimore 18, Md *Prof of Physiological Climatology, Lecturer in Physiological Hygiene* (1, 1949)
- Lee, Milton O**, Ph D 2101 Constitution Ave, Washington 25, D C *Exec Sec and Managing Editor, American Physiological Society, Federation Sec* (1, 1927, 5, 1933)
- Lee, Richard E**, Ph D, M D New York Hospital, Dept of Medicine, New York City 21 *Fellow in Medicine, Cornell Univ College of Medicine* (1, 1950)
- Leese, Chester E**, Ph D George Washington Univ School of Medicine, Washington, D C *Assoc Prof of Physiology* (1, 1934)
- LeFevre, Paul G**, Ph D Univ of Vermont College of Medicine, Dept of Physiology and Biophysics, Burlington *Asst Prof* (1, 1950)
- Lehman, Arnold J**, Ph D, M D Food and Drug Admin, Washington 25, D C *Chief, Div of Pharmacology* (3, 1937)
- Lehman, Robert A**, Ph D Campbell Pharmaceutical Co, 254 W 31st St, New York City 1 *Dir of Research* (3, 1942)
- Lehninger, Albert L**, Ph D Univ of Chicago Med School, 950 E 59th St, Chicago 37, Ill *Assoc Prof of Biochemistry in Depts of Biochemistry and Surgery* (2, 1946)
- Lehr, David**, M D New York Med College, Flower and Fifth Ave Hospitals, Fifth Ave at 105th St, New York City 29 *Assoc Prof in Pharmacology and Medicine* (3, 1947)
- Leichsenring, Jane M**, Ph D Univ of Minnesota, Univ Farm, St Paul *Prof of Nutrition* (5, 1948)
- Leimdorfer, Alfred**, M D Univ of Illinois College of Medicine, Dept of Psychiatry, Chicago 12 *Assoc Prof* (1, 1947)
- Lein, Allen**, Ph D Northwestern Univ Med School, Dept of Physiology, Chicago 11, Ill *Asst Prof* (1, 1946)
- Lenhart, Carl H**, M D Lakeside Hospital, 2065 Adelbert Rd, Cleveland, Ohio *Oliver H Payne Prof of Surgery, Western Reserve Univ* (1, 1921)
- Lennette, Edwin H**, Ph D, M D California State Dept of Public Health, Berkeley *Dir, Viral and Rickettsial Disease Lab, Lecturer in Virology, School of Public Health, Univ of California* (4, 1941, 6, 1947)
- Leonard, Clifford Shattuck**, Ph D 286 Whitefield St, Guilford, Conn *Technical Assoc, Chemical-Biological Coordination Center, Natl Research Council* (3, 1927)
- Leonards, Jack Ralph**, Ph D Western Reserve Univ Med School, Cleveland, Ohio *Asst Prof of Biochemistry* (2, 1948)
- Le Page, G A**, Ph D Univ of Wisconsin, McArdle Memorial Lab for Cancer Research, Madison 6 *Assoc Prof of Oncology* (2, 1949)
- Lepkovsky, Samuel**, Ph D Univ of California, Poultry Div, Berkeley 4 *Prof of Poultry Husbandry* (2, 1933, 5, 1933)
- L'Esperance, Elise L**, M D 2 East 61st St, New York City *Dir, Strong Cancer Precaution Clinic, Memorial Hospital, and New York Infirmary* (6, 1920)
- Leverton, Ruth M**, Ph D Univ of Nebraska, Dept of Home Economics, Lincoln *Assoc Prof of Human Nutrition Research* (5, 1942)
- Levin, Louis**, Ph D Columbia Univ, College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Asst Prof of Anatomy* (2, 1939)
- Levine, Harold**, Ph D 941 E Sylvan Ave, Milwaukee 11, Wis (2, 1933, 5, 1933)
- Levine, Milton**, Ph D Kabat Kuser Inst 2600 Alameda St, Vallejo Calif *Dir of Research* (6, 1942)
- Levine, Philip**, M D Ortho Research Foundation, Raritan, N J *Dir, Biologic Div* (6, 1925)
- Levine, Rachmiel**, M D Michael Reese Hospital, Chicago, Ill *Acting Dir, Dept of Metabolic Research, Professorial Lecturer in Physiology, Univ of Chicago* (1, 1942)

- Levine, Samuel Z, M D, New York Hospital, 525 E 68th St, New York City *Prof of Pediatrics, Cornell Univ Med College, Pediatrician-in Chief, New York Hospital* (5, 1933)
- Levine, Victor Emanuel, Ph D, M D Creighton Univ School of Medicine, Omaha, Nebr *Prof of Biological Chemistry and Nutrition* (2, 1936)
- Levinson, Samuel A, Ph D, M D Univ of Illinois College of Medicine, 808 S Wood St, Chicago *Prof of Pathology, Dir of Labs, Research and Educational Hospital* (4, 1938)
- Levison, Louis A, M D 421 Michigan St, Toledo, Ohio *Physician to Toledo and St Vincent Hospitals* (6, 1916)
- Levy, Milton, Ph D New York Univ College of Medicine, 477 First Ave, New York City *Assoc Prof of Chemistry* (2, 1933)
- Levy, Robert L, M D 730 Park Ave, New York City *Prof of Clin Medicine, Columbia Univ College of Physicians and Surgeons* (3, 1915)
- Lewey, F H, M D 3400 Spruce St, Philadelphia 4, Pa *Prof of Neuroanatomy, Univ of Pennsylvania Grad School of Medicine, Assoc in Neuro-pathology and Neurosurgery, Med School* (1, 1937)
- Lewis, George T, Ph D Emory Univ School of Dentistry, Dept of Biochemistry, Emory Univ, Ga *Professor* (2, 1949)
- Lewis, Gladys Kinsman, Ph D 401 S Lafayette St, Denver 9, Colo *Nutrition Consultant, Colorado State Dept of Health* (5, 1944)
- Lewis, Howard Bishop, Ph D Univ of Michigan Med School, Ann Arbor *John Jacob Abel Univ Prof of Biological Chemistry* (1, 1925, 2, 1913, 5, 1933)
- Lewis, James C, Ph D U S Dept of Agriculture, Western Regional Research Lab, Albany 6, Calif *Biochemist* (2, 1946)
- Lewis, Jessica H, M D Univ of North Carolina School of Medicine, Dept of Physiology, Chapel Hill *Research Assoc* (1, 1949)
- Lewis, John R, Ph D Sterling-Winthrop Research Inst, Rensselaer, N Y *Research Assoc in Pharmacology* (3, 1950)
- Lewis, Julian Herman, M D 4750 Champlain Ave, Chicago, Ill *Assoc Prof of Pathology, Univ of Chicago, Member, Otho S A Sprague Memorial Inst* (4, 1924)
- Lewis, Lena A, Ph D Cleveland Clinic, Euclid Ave and E 93rd St, Cleveland 6, Ohio *Research Staff* (1, 1946)
- Lewis, Robert C, Ph D Univ of Colorado, 4200 E 9th Ave, Denver *Prof of Biochemistry, Dean, School of Medicine* (2, 1931, 5, 1933)
- Lewis, Warren H, M D Wistar Inst of Anatomy and Biology, Philadelphia, Pa *Member* (1R, 1919)
- Ley, Herbert Leonard, Jr, M D Army Med Center, AMDR & GS, Dept Virus and Rickettsial Diseases, Washington 12, D C *Assistant* (6, 1949)
- Li, Choh Hao, Ph D Univ of California, 4596 Life Sciences Bldg, Berkeley *Prof of Biochemistry* (2, 1944)
- Li, Richard C, M D c/o Dr T S Yu, 392 MaDang Rd, Shanghai 25, China *Guest in Dept of Pharmacology, Natl Med College of Shanghai* (3, 1941)
- Libby, Raymond L, Ph D Veterans Admin, Wilshire and Sawtelle Blvds, Los Angeles 25, Calif *Assoc Prof of Radio Biology, Univ of California Med School, Chief of Isotope Section, Veterans Hospital, Los Angeles* (6, 1938)
- Liberson, W T, M D Inst of Living, Hartford, Conn *Neurophysiologist* (1, 1948)
- Libet, Benjamin, Ph D Univ of California Med Center, Dept of Anatomy, San Francisco *Asst Prof of Physiology, Med School* (1, 1942)
- Licklider, J C R, Ph D Massachusetts Inst of Technology, Acoustics Lab Cambridge (1, 1938)
- Liddell, Howard S, Ph D Cornell Univ, Ithaca, N Y *Prof of Psychology* (1, 1925)
- Lieb, Charles C, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City *Hosack Prof of Pharmacology* (1R, 1936, 3R, 1915)
- Lieberman, Arnold L, M D, Ph D 328 No Country Club Rd, Tucson, Ariz (1, 1934)
- Lieberman, Seymour, Ph D Columbia Univ, College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Asst Prof of Biochemistry assigned to Obstetrics and Gynecology* (2, 1948)
- Lifson, Nathan, M D, Ph D 6129 Wentworth Ave, S, Minneapolis, Minn *Prof of Physiology, Univ of Minnesota Med School* (1, 1944)
- Lightbody, Howard D, Ph D QM Food and Container Inst for the Armed Forces, 1849 W Pershing Rd, Chicago 9, Ill *Dir of Food Labs* (2, 1936)
- Ligon, Edgar Williams, Jr, Ph D Production and Marketing Admin, Insecticide Div, Agricultural Research Center, Beltsville, Md *Pharmacologist* (3, 1948)
- Lilienthal, Joseph L, Jr, M D Johns Hopkins Hospital, Baltimore 5, Md *Assoc Prof of Medicine* (1, 1945)
- Lillie, Ralph Stayner, Ph D Physiological Labs, Univ of Chicago, Chicago 37, Ill *Prof Emeritus of Physiology* (1R, 1905, 2, 1913)
- Lillie, R D, M D Pathology and Pharmacology Lab, E B M I, Natl Insts of Health, Bethesda, Md *Chief, Med Dir, USPHS* (4, 1941)
- Lilly, John C, M D 3400 Spruce St, Philadelphia 4, Pa *Asst Prof in Biophysics, E R Johnson Foundation for Med Physics, Univ of Pennsylvania, School of Medicine* (1, 1950)

- Lim, Robert Kho-Seng**, M B , Ph D , D Sc
Creighton Univ School of Medicine, Omaha 2,
Nebr *Prof of Physiology* (1, 1923)
- Lindeman, V F**, Ph D Syracuse Univ , 16 Lyman
Hall, Syracuse, N Y *Prof of Zoology*, (1, 1949)
- Lindsay, Stuart, M D** Univ of California Med
School, Univ Hospital, San Francisco 22
Assoc Prof and Pathologist (4, 1949)
- Lindsley, Donald B**, Ph D Northwestern Univ ,
Evanston, Ill *Prof of Psychology* (1, 1937)
- Linegar, Charles R**, Ph D E R Squibb and Sons,
Research and Development Labs , New Brun-
swick, N J *Dir , Pharmacological Development*
Div , (3, 1938)
- Lineweaver, Hans**, Ph D U S Dept of Agricul-
ture, Western Regional Research Lab , Albany
6, Calif *Head of Poultry Products Div* (2, 1941)
- Link, Karl Paul**, Ph D Univ of Wisconsin, Bio-
chemistry Bldg , Madison *Prof of Biochemistry*
(2, 1931)
- Lintz, William**, M D 36 Plaza St , Brooklyn, N Y
Late Prof of Immunology and Bacteriology and
Clin Prof of Medicine, Long Island College of
Medicine (6, 1920)
- Lipman, Mrs Miriam O**, A M Presbyterian Hos-
pital, Dept of Medicine, 620 W 168th St , New
York City *Research Asst , Edward Daniels*
Faulkner Arthritis Clinic (6, 1931)
- Lipmann, Fritz**, M D , Ph D Massachusetts Gen-
eral Hospital, Biochemical Research Lab , Bos-
ton 14 *Head, Prof of Biological Chemistry*, Har-
vard Med School (2, 1941)
- Lippincott, Stuart W**, M D Univ of Washington
School of Medicine, Seattle *Chairman, Dept of*
Pathology (4, 1947)
- Lippman, Richard W**, M D 4751 Fountain Ave ,
Los Angeles 27, Calif *Research Assoc , Inst for*
Med Research, Cedars of Lebanon Hospital (1,
1950)
- Lipton, Morris A**, Ph D , M D Univ of Chicago,
Dept of Medicine, 950 E 59th St , Chicago 37,
Ill *Fellow, Psychiatry* (2, 1946)
- Lisco, Hermann**, M D Argonne Natl Lab , Chi-
cago 80, Ill *Dir , Med Div , Asst Prof of Pathol-*
ogy, Univ of Chicago (4, 1947)
- Litchfield, John T , Jr**, M D American Cyanamid
Co , 1937 W Main St Stamford, Conn *Phar-*
macologist (3, 1940)
- Little, James Maxwell**, Ph D Bowman Gray
School of Medicine of Wake Forest College,
Winston-Salem, N C *Prof of Pharmacology*,
Assoc Prof of Physiology (1, 1942, 3, 1947)
- Little, Robert C**, M D Univ of Tennessee, Dept
of Physiology, Memphis *Asst Prof* (1, 1950)
- Livingston, Alfred E**, Ph D Temple Univ School
of Medicine, Philadelphia, Pa *Prof of Pharma-*
cology (1, 1917, 3, 1920)
- Livingston, Robert B**, M D 333 Cedar St , New
Haven, Conn *Instr , Lab of Physiology* (1,
1949)
- Lloyd, David P C**, Ph D Rockefeller Inst for
Med Research, 66th St and York Ave , New
York City 21 *Assoc Member* (1, 1939)
- Locke, Arthur P**, Ph D Zonite Products Corp ,
New Brunswick, N J *Chief Research Chemist*
(6, 1926)
- Lodholz, Edward**, M D Univ of Pennsylvania,
Med Labs , Philadelphia *Prof Emeritus of*
Physiology, Grad School of Medicine (1, 1913)
- Loeb, Leo**, M D Washington Univ Med School,
St Louis, Mo *Prof Emeritus of Pathology* (1R,
1907, 4, 1913)
- Loebel, Robert O**, M D 205 East 78th St , New
York City (1R, 1928)
- Loefer, John B**, Ph D Foundation of Applied Re-
search, P O Box 2296, San Antonio 6, Tex
Chief Biologist (1, 1949)
- Loew, Earl R**, Ph D Boston Univ School of Medi-
cine, 80 E Concord St , Boston 18, Mass *Prof*
of Physiology (1, 1940, 3, 1946)
- Loewe, W S**, M D Univ of Utah School of Medi-
cine, Dept of Pharmacology, Salt Lake City 1
(3, 1936)
- Logan, Milan A**, Ph D Univ of Cincinnati Col-
lege of Medicine, Eden and Bethesda, Cincinnati
19, Ohio *Prof of Biological Chemistry* (2, 1936)
- Long, C N H**, D Sc , M D Yale Univ , 333 Cedar
St , New Haven 11, Conn *Dean, School of Medi-*
cine and Sterling Prof of Physiological Chemistry
(1, 1935, 2, 1927)
- Long, Esmond R**, M D 7th and Lombard Sts ,
Philadelphia, Pa *Dir , Henry Phipps Inst , Prof*
of Pathology, Univ of Pennsylvania (4, 1930)
- Long, Perrin Hamilton**, M D Johns Hopkins
Univ , 615 N Wolfe St , Baltimore, Md *Prof of*
Preventive Medicine (3, 1940)
- Longcope, Warfield T**, M D Cornhill Farm, Lee,
Mass (3R, 1921, 4, 1913, 6R, 1923)
- Longenecker, Herbert Eugene**, Ph D Univ of
Pittsburgh, Pittsburgh 13, Pa *Dean, Grad*
School, Prof of Biochemistry (2, 1940, 5, 1945)
- Longwell, Bernard B**, Ph D Univ of Colorado
School of Medicine, 4200 East 9th Ave , Denver
7, Colo *Prof of Biochemistry* (2, 1946)
- Loofbourrow, G N**, Ph D Univ of Kansas, Dept
of Physiology, Lawrence *Asst Prof* (1, 1950)
- Looms, Ted A** Ph D , M D Univ of Washington
School of Medicine, Seattle *Assoc Prof of*
Pharmacology (3, 1948)
- Looney, Joseph M**, M D 75 Park St , West Rox-
bury, Mass *Chief of Labs , V A Regional*
Office, Boston (2, 1922)
- Loosli, Clayton Garr**, M D , Ph D Univ of Chi-
cago, Chicago, Ill *Prof of Preventive Medicine*
(4, 1940)
- Loosli, J K**, Ph D Cornell Univ , Animal Nutri-
tion Lab , Ithaca, N Y *Assoc Prof of Animal*

- Nutrition and Assoc Animal Nutritionist in Exper Station* (5, 1944)
- Lorber, Victor**, M D , Ph D Western Reserve Univ School of Medicine, Dept of Biochemistry, Cleveland, Ohio *Assoc Prof* (1, 1944)
- Lorente de N6, Rafael**, M D Rockefeller Inst for Med Research, 66th St and York Ave , New York City *Member* (1, 1937)
- Lorenz, Egon**, Ph D Natl Cancer Inst , Bethesda, Md *Biophysicist* (4, 1942)
- Loring, H S**, Ph D Stanford Univ , Dept of Chemistry Stanford Univ , Calif *Prof of Biochemistry* (2, 1938)
- Lotspeich, William D**, M D Oxford Univ , Dept of Biochemistry, Oxford, England *Research Fellow in Biochemistry* (1, 1948)
- Louis, Lawrence H**, D Sc Univ Hospital, Dept of Internal Medicine, Ann Arbor, Mich *Asst Prof of Biological Chemistry, Univ of Michigan* (2, 1949)
- Loveless, Mary H**, M D New York Hospital, 525 I 68th St , New York City *Research Assoc , Cornell Med School, Physician to Out-Patients, New York Hospital* (6, 1941)
- Lowell, Francis C**, M D 65 East Newton St , Boston, Mass *Assoc Prof of Medicine, Boston Univ School of Medicine* (6, 1942)
- Lowenbach, Hans**, M D Duke Univ Med School, Durham, N C *Assoc Prof of Neuropsychiatry and Physiology* (1, 1946)
- Lowry, Oliver H**, M D , Ph D Washington Univ School of Medicine, 4580 Scott Ave , St Louis 10, Mo *Prof and Head of Dept of Pharmacology* (2, 1942, 3, 1950)
- Lu, Go**, M D Univ of Maryland Med School, Dept of Pharmacology, Baltimore 1 *Fellow* (3, 1949)
- Lubinski, Herbert**, M D Jewish General Hospital, 3755 St Catherine Rd , Montreal, Quebec, Canada *Bacteriologist and Serologist* (6, 1941)
- Lucas, Colin C**, Ph D Univ of Toronto, Banting and Best Dept of Med Research, Toronto, Ontario, Canada *Professor* (2, 1946)
- Lucas, George H W**, Ph D Univ of Toronto, Toronto, Ontario, Canada *Prof of Pharmacology* (2, 1925, 3, 1928)
- Luck, James Murray**, Ph D Stanford Univ , Stanford Univ , Calif *Prof of Biochemistry* (2, 1925)
- Lucké, Balduin**, M D , D P H 141 Montgomery Ave , Bala-Cynwyd, Pa *Prof of Pathology, Univ of Pennsylvania Med School, Philadelphia* (4, 1924)
- Luckhardt, Arno Benedict**, Ph D , M D Univ of Chicago, Chicago, Ill *The Dr Wm Beaumont Distinguished Service Prof of Physiology* (1, 1911)
- Ludewig, Stephan**, Ph D Univ of Virginia School of Medicine, Charlottesville *Assoc Prof of Biochemistry* (2, 1941)
- Luduena, Froilan P**, Ph D , M D Sterling-Winthrop Research Inst , Rensselaer, N Y *Research Pharmacologist* (3, 1941)
- Luecke, Richard W**, Ph D Michigan State College, Dept of Agricultural Chemistry, East Lansing *Prof (Research)* (5, 1950)
- Luft, Ulrich C**, M D USAF School of Aviation Medicine, Randolph AFB , Tex *Research Physiologist* (1, 1950)
- Lukens, Francis D W**, M D Univ of Pennsylvania 809 Maloney Clinic, 36th and Spruce Sts , Philadelphia *Assoc Prof of Medicine, Dir of George S Cox Med Research Inst* (1, 1938)
- Lund, E J**, Ph D 1000 Barton Blvd , Austin, Tex *Prof of General Physiology, Univ of Texas* (1, 1930)
- Lundberg, Walter O**, Ph D Hormel Inst, Austin, Minn *Director, Prof of Agricultural Biochemistry, Univ of Minnesota* (2, 1949)
- Lundgren, Harold P**, Ph D U S Dept of Agriculture, Western Regional Research Lab , Albany 6 Calif *Sr Chemist* (2, 1942)
- Lundy, John Silas**, M D Mayo Foundation, Rochester, Minn *Prof of Anesthesiology, Chief of Section on Anesthesia, Mayo Clinic* (3, 1935)
- Lurie, Max B**, M D Henry Phipps Inst , 7th and Lombard Sts , Philadelphia, Pa *Assoc Prof of Exper Pathology* (4, 1934, 6, 1930)
- Lushbaugh, Clarence C**, M D , Ph D Los Alamos Scientific Lab , P O Box 1663, Los Alamos, N Mex *Staff Member, Pathologist, Los Alamos Hospital* (4, 1950)
- Lutz, Brenton R**, Ph D Boston Univ , 675 Commonwealth Ave , Boston, Mass *Prof of Biology* (1, 1925)
- Luyet, Basile J**, Sc D St Louis Univ School of Medicine, St Louis, Mo *Prof of Biology* (1, 1936)
- Lyall, Harold W**, Ph D New York State Dept of Health, Div of Labs and Research, Albany *Asst Dir in charge of Antitoxin, Serum, and Vaccine Labs* (6, 1937)
- Lyman, Carl M**, Ph D A and M College of Texas, Texas Agricultural Exper Station, College Station *Prof and Head of Dept of Biochemistry and Nutrition* (2, 1940)
- Lyman, John F**, Ph D Ohio State Univ , Townsend Hall, Columbus *Prof of Agricultural Chemistry* (2, 1920, 5R, 1933)
- Maaske, Clarence A**, Ph D Univ of Colorado School of Medicine, 4200 E 9th Ave , Denver *Prof of Physiology* (1, 1945)
- Macallum, A Bruce**, M D , Ph D Univ of Western Ontario Med School, London, Ontario, Canada *Research Prof of Biochemistry* (2, 1914)
- MacCardle, Ross C**, Ph D Natl Cancer Inst , Bethesda, Md *Principal Cytologist* (4, 1948)
- MacCorquodale, D W**, Ph D Abbott Labs

- North Chicago, Ill *Head of Biochemical Research* (2, 1934)
- MacFadyen, Douglas A**, M D Presbyterian Hospital, 1753 W Congress St, Chicago 12, Ill *Chairman of Dept of Biochemistry* (2, 1942)
- Macht, David Israel**, M D Sinai Hospital, Baltimore, Md *Consultant Pharmacologist, Research Pharmacologist, Sinai Hospital Labs* (1R, 1916, 3, 1915)
- Macht, Martin B**, Ph D The Jewish Hospital, Cincinnati 29, Ohio (1, 1948)
- MacIntosh, F C**, Ph D McGill Univ, Dept of Physiology, Montreal, Quebec, Canada *Professor and Chairman of Dept* (1, 1950, 3, 1950)
- MacKay, Eaton M**, M D Scripps Metabolic Clinic, La Jolla, Calif (1, 1930)
- MacKay, Ian F S**, Ph D Univ College of the West Indies, Jamaica, British West Indies *Prof of Physiology* (1, 1949)
- Mackenzie, Cosmo G**, Sc.D Univ of Colorado School of Medicine, Dept of Biochemistry, 4200 E 9th Ave, Denver 7 *Professor* (1, 1946, 2, 1946, 5, 1942)
- Mackenzie, George M**, M D Mary Imogene Bassett Hospital, Cooperstown, N Y *Physician-in-Chief, Dir, Otsego County Lab* (6, 1912)
- MacLeod, Colin M**, M D New York Univ College of Medicine, 477 First Ave, New York City *Prof of Bacteriology* (6, 1937)
- MacLeod, Florence L**, Ph D Univ of Tennessee, Knoxville *Prof of Nutrition* (2, 1927, 5, 1933)
- MacLeod, Grace**, Ph D 106 Morningside Drive, New York City 27 *Prof Emeritus of Nutrition, Teachers College, Columbia Univ* (2, 1924, 5R, 1933)
- MacLeod, John**, Ph D Cornell Univ Med College, 1300 York Ave, New York City *Asst Prof of Anatomy* (1, 1942)
- MacNabb, Andrew L**, V S, B V Sc Guelph, Ontario, Canada *Principal, Ontario Veterinary College* (6, 1941)
- MacNider, William deB**, M D, Sc D Univ of North Carolina, Chapel Hill *Kenan Research Prof of Pharmacology* (1, 1912, 2, 1912, 3, 1909, 4, prior to 1920)
- MacPherson, Catherine F C**, Ph D 236 Brock Ave N, Montreal West, Quebec, Canada (2, 1947)
- MacPhillamy, Betty B**, Ph D 145 Greene Ave, Madison, N J *Bacteriologist* (6R, 1944)
- MacVicar, Robert**, Ph D Oklahoma A & M College, Stillwater *Prof and Head of Dept of Agricultural Chemistry Research* (2, 1949)
- Madden, Sidney C**, M D Brookhaven Natl Lab, Upton, L I, N Y *Head, Div of Pathology, Pathologist-in-Chief, Brookhaven Natl Lab Hospital* (4, 1939)
- Maddock, Stephen**, M D Boston City Hospital, Boston, Mass *Dir of Surgical Research Lab, Asst Prof of Surgery, Tufts Med School* (4, 1931)
- Madsen, Louis L**, Ph D Utah State Agricultural College, Dept of Animal Husbandry, Logan *Nutritionist* (5, 1940)
- Magath, Thomas B**, Ph D, M D Mayo Clinic, Rochester, Minn *Head of Div of Clin Labs, Prof of Clin Pathology and Parasitology, Univ of Minnesota, Mayo Foundation* (1, 1928)
- Magill, Thomas P**, M D Long Island College of Medicine, Brooklyn, N Y *Prof of Bacteriology* (6, 1937)
- Magladery, J W**, M D, Ph D, M R C P Johns Hopkins Hospital, Baltimore, Md *Asst Prof of Neurology, Johns Hopkins University* (1, 1950)
- Magnuson, Harold J**, M D, M P H Univ of North Carolina, Chapel Hill *Research Prof of Exper Medicine, Sr Surgeon, USPHS* (4, 1950)
- Magoun, Horace W**, Ph D Univ of California Med School, Los Angeles 24 (1, 1937)
- Mahon, Eleanor Conway**, Ph D Iron River, Mich (4, 1940)
- Main, Roland J**, Ph D Eaton Labs, Inc, Eaton Ave, Norwich, N Y *Med Editor and Consultant in Physiology* (1 1936)
- Maison, George L**, M S, M D Boston Univ Med School, 80 E Concord St, Boston 18, Mass *Prof and Head of Pharmacology Dept* (1, 1939, 3, 1948)
- Major, Randolph T**, Ph D Merck and Co, Inc, Rahway, N J *Vice Pres and Scientific Dir* (2, 1942)
- Malkiel, Saul**, Northwestern Univ Med School, Evanston, Ill *Asst Prof of Medicine, Dir of Allergy Research Lab* (6, 1948)
- Mallory, G Kenneth**, M D Mallory Inst of Pathology, Boston City Hospital, Boston, Mass *Professor* (4, 1940)
- Mallory, Tracy B**, M D Massachusetts General Hospital, Boston *Dir of Pathology and Bacteriology, Prof of Pathology, Harvard Med School* (4, 1937)
- Maloney, Arnold H**, Ph D, M D Howard Univ School of Medicine, Washington, D C *Prof and Head of Dept of Pharmacology* (3, 1932)
- Maltaner, Frank**, Ph D Scarsdale Manor, Scarsdale, N Y *Biochemist, Div of Lab and Research, New York State Dept of Health* (6, 1920)
- Maluf, N S Rustum**, Ph D Columbia Univ, Presbyterian Hospital, Squier Urological Clinic, New York City 32 *Resident in Urology* (1, 1942)
- Man, Evelyn B**, Ph D Yale Univ School of Medicine, 333 Cedar St, New Haven, Conn *1st Prof in Biochemistry Lab, Dept of Medicine* (2, 1936)
- Manerv, Jeanne Forest**, Ph D Univ of Toronto

- Med School Toronto, Ontario, Canada *Demonstration in Biochemistry* (1, 1937)
- Mangun George H, Ph D Henry Ford Hospital, 15713 Heyden St, Detroit 23, Mich *Sr Assoc in Clin Chemistry* (2, 1947)
- Mann Frank C, M A, M D Mayo Clinic, Box 200 Rochester, Minn *Prof of Exper Medicine, Mayo Foundation* (1, 1916, 4R, 1924)
- Mann Frank D, Ph D M D 102-110 2nd Ave, S W Rochester Minn *Consultant in Clinical Pathology Mayo Clinic, Asst Prof of Clinical Pathology Mayo Foundation* (1, 1950, 4, 1950)
- Manning G W M D Ph D Victoria Hospital, London Ontario Canada *Asst Prof of Clin Investigation Dept of Medicine, Lecturer, Dept of Physiology Univ of Western Ontario* (1, 1944)
- Manville, Ira Albert, M D, Ph D 811 N W 19th Ave Portland 9 Ore (1, 1933)
- Manwaring, Wilfred H, M D Stanford Univ, Stanford University, Calif *Prof Emeritus of Bacteriology and Exper Pathology* (4, prior to 1920 6 1917)
- Marbarger John P, Ph D Univ of Illinois Physical Environment Unit, 1853 W Polk St, Chicago 12 *Research Div Aeromed and Physical Environment Lab Assoc Prof of Physiology* (1, 1949)
- Marcus Stanley, Ph D Univ of Utah, Dept of Bacteriology Salt Lake City *Assoc Prof* (6, 1948)
- Marcus Thomas H, A B Johns Hopkins Med School 710 N Washington St, Baltimore, Md *Lecturer in Pharmacology* (3, 1950)
- Marine David M A M D 18 Baltimore Ave, Lenoxville Del 1910, 4, 1913)
- Mark Lester C M D 535 E 14th St, New York City *Assoc Prof Fellow in Anesthesiology* (3, 1949)
- Markes Joseph F Ph D Duke Univ School of Medicine Durham N C *Prof of Anatomy* (1, 1949)
- Markowitz J M D Ph D Univ of Toronto School of Medicine, Toronto, Ontario, Canada *Research Assoc in Physiology* (1, 1929)
- Marmont, George H Ph D Univ of Chicago, Inst of Radiobiology and Biophysics, Chicago 37 Ill 1st *Prof of Physiology* (1, 1941)
- Marmorston, Jessie Inst for Med Research, 4751 Fountain Ave Los Angeles, Calif *Asst Prof of Medicine Univ of Southern California Staff County and Cedars of Lebanon Hospitals* (6, 1932)
- Marrazzi, Amedeo S, M D Med Div, Army Chemical Center, Md *Chief, Toxicology Section* (1, 1949, 3, 1938)
- Marsh, David F, Ph D West Virginia Univ, School of Medicine, Dept of Pharmacology, Morgantown *Head and Prof of Pharmacology* (3, 1946)
- Marsh, Gordon, Ph D State Univ of Iowa, Iowa City *Assoc Prof of Zoology* (1, 1944)
- Marsh, M Elizabeth, Ph D P O Box 17, Soquel, Calif (1, 1929, 5, 1933)
- Marshak, Alfred George, Ph D New York Univ College of Medicine, New York City *Research Assoc* (1, 1940)
- Marshall, Eli Kennerly, Jr, Ph D, M D Johns Hopkins Med School, Baltimore, Md *Prof of Pharmacology and Exper Therapeutics* (1, 1915, 2, 1913, 3, 1915)
- Marshall, Louise Hanson, Ph D Natl Insts of Health, Inst of Exper Biology and Medicine, Bethesda, Md *Physiologist* (1, 1946)
- Marshall, Wade H, Ph D Natl Insts of Health, Bethesda, Md *Research Fellow, Lab of Physical Biology* (1, 1937)
- Martin, Arthur W, Jr, Ph D Univ of Washington, Johnson Hall, Seattle *Executive Officer, Dept of Zoology* (1, 1944)
- Martin, Donald S, M D Univ of Puerto Rico, School of Medicine, San Juan, Puerto Rico (6, 1943)
- Martin, Foster N, Jr, Ph D, M D Tulane Univ Med School, P O Station 20, New Orleans, La *Asst Prof of Pharmacology* (3, 1947)
- Martin, Stephens J, Ph D St Francis Hospital, Hartford, Conn (1, 1933)
- Mars, Walter, Ph D Univ of Southern California School of Medicine, Los Angeles 7, Calif *Assoc Prof of Biochemistry* (2, 1949)
- Mason, Edward C, M D, Ph D Univ of Oklahoma School of Medicine, Oklahoma City *Prof of Physiology* (1, 1935)
- Mason, Eleanor Dewey, Ph D Women's Christian College, Dept of Physiology and Nutrition, Cathedral P O, Madras, India *Prof of Physiology and Nutrition* (1, 1946)
- Mason, Herman C, 131 N Harvey Ave, Oak Park, Ill *Consulting Bacteriologist and Immunologist* (6, 1948)
- Mason, Harold L, Ph D Mayo Clinic, Rochester, Minn *Prof of Physiological Chemistry, Mayo Foundation, Univ of Minnesota* (2, 1941)
- Mason, Howard S, Ph D Natl Insts of Health, Bethesda 14, Md *Cancer Inst Fellow* (2, 1949)
- Mason, Karl Ernest, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Prof of Anatomy* (5, 1941)
- Mason, Morton F, Ph D Parkland Hospital, Oak Lawn at Maple, Dallas 4, Tex *Prof of Pathological Chemistry, Dept of Medicine, Southwestern Med College of the Univ of Texas* (2, 1938)
- Mason, Richard P, M D Army Med Dept, Research and Grad School, Virus and Rickettsial Disease Dept, Washington, D C *Chief, Rickettsial Disease Research Section* (6, 1950)
- Massengale, Oliver N, Ph D Mead Johnson and

- Co, Research Lab, Evansville, Ind *Research Biochemist* (2, 1937)
- Masson, Georges M C**, Ph D Cleveland Clinic Foundation, Research Div, Cleveland, Ohio (1, 1944)
- Mathews, Albert P**, Ph D Marine Biological Lab, Woods Hole, Mass *Carnegie Prof Emeritus of Biochemistry, Univ of Cincinnati* (1R, 1898, 2, 1906)
- Matson, Gustave A**, Ph D Minneapolis Memorial Blood Bank, Inc, 1914 La Salle Ave, Minneapolis, Minn *Director* (6, 1946)
- Matthews, Samuel A**, Ph D Williams College, Williamstown, Mass *Prof of Biology* (1, 1948)
- Mattill, Henry A**, Ph D State Univ of Iowa, Iowa City *Prof and Head of Dept of Biochemistry* (1, 1913, 2, 1909, 5, 1933)
- Mattis, Paul A**, D Sc Western Reserve Univ School of Medicine, Cleveland, Ohio *Asst Prof of Pharmacology* (3, 1946)
- Maurer, Frank W**, Ph D 301 Lake Ave, Newton Highlands 61, Mass (1, 1941)
- Maurer, Fred D**, D V M, Ph D Army Med Dept, Research and Grad School, Army Med Center, Veterinary Div, Washington 12, D C *Chief, Dept Veterinary Virology* (6, 1950)
- Mautz, Frederick R**, M D 10515 Carnegie Ave, Cleveland 6, Ohio (1, 1945)
- Maver, Mary E**, Ph D Natl Cancer Inst, Bethesda 14, Md *Sr Biochemist* (2, 1947)
- Mavor, James Watt**, Ph D 8 Gracewood Park, Cambridge, Mass (1R, 1930)
- Maxfield, Mary E**, Ph D Woman's Med College of Pennsylvania, Dept of Pharmacology, Philadelphia *Assoc Prof* (1, 1947)
- Mayer, Dennis T**, Ph D Univ of Missouri, Dept of Agricultural Chemistry, 211 Schweitzer Hall, Columbia *Assoc Prof* (2, 1950)
- Mayer Manfred M**, Ph D 1331 Howard Rd, Glen Burnie, Md *Assoc Prof of Bacteriology, Johns Hopkins Hospital, School of Hygiene* (6, 1946)
- Maverson, Hymen S**, Ph D Tulane Univ School of Medicine, Station 20, New Orleans, La *Prof and Head of Dept of Physiology* (1, 1928)
- Mavnard, Elliott Allen**, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester 20, N Y *Asst Prof of Pharmacology and Toxicology* (3 1950)
- Maynard, L A**, Ph D Cornell Univ, Ithaca, N Y *Prof of Nutrition and Biochemistry, Dir of School of Nutrition* (2, 1930, 5, 1933)
- Mazur, Abraham**, Ph D City College of New York, 139th St and Convent Ave, New York City 31 *1st Prof in Dept of Chemistry* (2, 1944)
- McCann, William S**, M D, D Sc Univ of Rochester School of Medicine, Rochester N Y *The Charles A Dewey Prof of Medicine* (2, 1923, 5, 1933)
- McCarrell, Jane D** Hood College, Dept of Biology, Frederick, Md (1, 1942)
- McCarty, Maclyn, M D** 66th St and York Ave, New York City 21 *Assoc, Rockefeller Inst for Med Research* (6, 1947)
- McCawley, Elton Leeman**, Ph D Univ of Oregon, Dept of Pharmacology, Portland *Assoc Prof* (3, 1944)
- McCay, Clive M**, Ph D Cornell Univ, Animal Nutrition Lab, Dairy Bldg, Ithaca, N Y *Prof of Nutrition* (2, 1929, 5, 1933)
- McChesney, Evan William**, Ph D Sterling-Winthrop Research Inst, Rensselaer, N Y *Member, Biological Div* (1, 1944)
- McClellan, Walter S**, M D Saratoga Spa, Saratoga Springs, N Y *Med Dir, Assoc Prof of Medicine, Albany Med College* (1, 1931)
- McClendon, J F**, Ph D Route 1, Box 383, Trooper Rd, Norristown, Pa *Research Prof of Physiology, Hahnemann Med College* (1R, 1910, 2, 1914, 5R, 1935)
- McClung, L S** Indiana Univ, Bloomington *Assoc Prof and Chairman of Dept of Bacteriology* (6, 1948)
- McCollum, Elmer Verner**, Ph D Johns Hopkins Univ, Baltimore 18, Md *Prof Emeritus of Biochemistry* (2, 1910, 5, 1933)
- McCollum, Ernestine Becker**, M A Johns Hopkins Univ School of Hygiene, Baltimore 5, Md *Asst Prof of Biochemistry* (5, 1938)
- McCouch, Grayson Prevost**, M D Univ of Pennsylvania School of Medicine, Philadelphia *Assoc Prof of Physiology* (1, 1925)
- McCouch, Margaret Sumwalt**, Ph D Rose Tree Rd, R F D 1, Media, Pa (1, 1934)
- McCoy, Richard H**, Ph D Univ of Pittsburgh, Pittsburgh, Pa *Assoc Research Prof of Chemistry* (2, 1950, 5, 1948)
- McCrea, Forrest D**, Ph D Duke Univ School of Medicine, Durham, N C *Assoc Prof of Physiology and Pharmacology* (1, 1929, 3, 1937)
- McCrudden, Francis H**, M D 19 Stoneleigh Rd, West Newton 65, Mass, *Asst Med Dir, New England Mutual Life Insurance Co* (2, 1906)
- McCulloch, Warren Sturgis**, M A, M D Univ of Illinois College of Medicine, 912 S Wood St, Chicago *Assoc Prof of Psychiatry* (1, 1936)
- McCutcheon, Morton**, M D Univ of Pennsylvania Med School Philadelphia *Prof of Pathology* (4, 1925)
- McDonald, Francis Guy**, Ph D Mead Johnson and Co Research Lab, 2404 W Pennsylvania St, Evansville Ind *Biochemist* (2, 1936, 5, 1947)
- McDonald, Roger K**, M D Baltimore City Hospitals, Cardiovascular Diseases Section, Baltimore 24, Md *Sr 1st Surgeon, USPHS, Natl Heart Inst, Bethesda, Md* (1, 1949)

- McEllroy, William Swindler, M D Univ of Pittsburgh School of Medicine, Pittsburgh, Pa *Dean, Prof of Physiological Chemistry* (2, 1919)
- McElroy, L W Ph D Univ of Alberta, Dept of Animal Science, Edmonton, Canada *Assoc Prof of Animal Husbandry* (5, 1944)
- McElroy, William D, Ph D Johns Hopkins Univ, Baltimore Md *Asst Prof of Biology* (1, 1945)
- McFarland, Ross A, Ph D Harvard Univ School of Public Health, Boston, Mass *Assoc Prof of Industrial Hygiene* (1, 1943)
- McFarlane, William Douglas, Ph D 496 Queen St, E, Toronto, Ontario, Canada *Dir of Research, Canadian Breweries, Ltd and Victory Mills, Ltd* (2, 1933)
- McGinty, Daniel A, Ph D Parke, Davis and Co, Detroit, Mich *Research Physiologist* (1, 1925)
- McGuigan, Hugh Alister, Ph D, M D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago *Prof Emeritus of Pharmacology* (1R, 1907, 2, 1906, 3R, 1913)
- McHargue, J S, Ph D Univ of Kentucky, Dept of Chemistry, Kentucky Agricultural Experiment Station, Lexington *Member Emeritus* (2, 1927)
- McHenry, E W, Ph D Univ of Toronto, School of Hygiene, Toronto, Ontario, Canada *Prof of Public Health Nutrition* (2, 1938, 5, 1935)
- McIntyre A R, Ph D, M D Univ of Nebraska College of Medicine, 42nd and Dewey Ave, Omaha *Prof of Physiology and Pharmacology* (1, 1933 3, 1938)
- McKee, Albert P R F D 7, Iowa City, Iowa *Assoc Prof of Bacteriology, State Univ of Iowa* (6, 1948)
- McKee, Clara M, Squibb Inst for Med Research, New Brunswick, N J *Assoc in Microbiology* (6, 1941)
- McKee, Frank W, M D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Instr in Pathology, James E Gleason Fellow* (4, 1947)
- McKee Ralph Wendell, Ph D Harvard Med School 25 Shattuck St, Boston 15, Mass *Asst Prof of Biological Chemistry* (2, 1946)
- McKennis, Herbert, Jr, Ph D Naval C E Research Lab, Port Hueneme, Calif *Assoc Prof of Biochemistry* (2, 1948)
- McKibbin, John M, Ph D State Univ of New York Med Center at Syracuse Univ, Syracuse, N Y *Assoc Prof of Biochemistry* (2, 1948)
- McLain, Paul L, M D Univ of Pittsburgh Med School, Pittsburgh, Pa *Prof of Physiology and Pharmacology* (1, 1948, 3, 1940)
- McLean, Franklin C, Ph D, M D Univ of Chicago, Chicago 37, Ill *Prof of Pathological Physiology* (1, 1914, 2, 1916, 3, 1916)
- McLean, I William, Jr, M D Parke, Davis Lab, Virus Research Div, Detroit, Mich *Research Virologist* (6, 1946)
- McLester, James S, M D Univ of Alabama, 930 S 20th St, Birmingham *Prof of Medicine* (5, 1933)
- McLimans, William F, Ph D Univ of Minnesota, 1834 Chelton Ave, St Paul *Asst Prof of Bacteriology and Immunology* (6, 1949)
- McManus, J F A, M D Univ of Virginia School of Medicine, Charlottesville *Assoc Prof of Pathology* (4, 1948)
- McMaster, Philip D, M D Rockefeller Inst for Med Research, 66th St and York Ave, New York City (4, 1924)
- McMeekin, Thomas L, Ph D U S Dept of Agriculture, Eastern Regional Research Lab, Philadelphia, Pa *Head of Protein Div* (2, 1935)
- McNamara, Bernard P, Ph D Med Div, Army Chemical Center, Md *Asst Chief, Pharmacology Section* (3, 1947)
- McNaught, James Bernard, M D Univ of Colorado School of Medicine, Denver 7 *Prof and Head of Dept of Pathology* (4, 1936)
- McNeil, Crichton, M D Holy Cross Hospital, Salt Lake City, Utah *Pathologist* (6, 1950)
- McPhail, Murchie K, Ph D Natl Defense Board, Suffield Experiment Station, Ralston, Alberta, Canada *Research Scientist* (3, 1941)
- McQuarrie, Irvine, Ph D, M D Univ of Minnesota, Minneapolis *Prof and Head of Dept of Pediatrics* (1, 1949, 4, 1927, 5, 1933)
- McShan, W H, Ph D Univ of Wisconsin, Biology Bldg, Madison 6 *Assoc Prof of Zoology* (2, 1947)
- Medes, Grace, Ph D Lankenau Hospital Research Inst, Philadelphia, Pa *Research Physiological Chemist* (2, 1930)
- Medlar, Edgar M, M D Veterans Admin Hospital, Sunmount, N Y *Chief Lab Pathologist* (4, 1927)
- Meek, Walter J, Ph D Univ of Wisconsin, Madison *Prof of Physiology, Assoc Dean of Med School* (1, 1908)
- Mehl, John W, Ph D Univ of Southern California, 3551 Univ Ave, Los Angeles *Prof of Biochemistry* (2, 1946)
- Meier, Rolf, M D Basle Univ, Pelikanweg 7, Basle, Switzerland *Dir, Biological Research Labs, Ciba A G* (3, 1949)
- Meiklejohn, Gordon, M D 678 Woodmont Ave, Berkeley, Calif *Instr in Medicine, Univ of California Med School* (6, 1948)
- Meister, Alton, M D Natl Cancer Inst, Bethesda 14, Md *Head, Unit on Biochemical Research* (2, 1950)
- Mertes, Joseph Michigan State College, Dept of Physiology and Pharmacology, East Lansing *Asst Prof* (1, 1949)
- Mellon, Ralph R, M S, M D, D P H Western Pennsylvania Hospital, Inst of Pathology, Pittsburgh *Director* (6, 1918)

- Melnick, Daniel**, Ph D The Best Foods, Inc , Research Labs , Bayonne, N J *Chief Technologist* (2, 1940, 5, 1942)
- Melnick, Joseph L**, Ph D Yale Univ School of Medicine, 333 Cedar St , New Haven 11, Conn *Assoc Prof of Microbiology* (2, 1946, 6, 1948)
- Melville, Donald B**, Ph D Cornell Univ Med College, 1300 York Ave , New York City 21 *Assoc Prof of Biochemistry* (2, 1947)
- Melville, Kenneth Ivan**, M D McGill Univ , Montreal, Quebec, Canada *Assoc Prof of Pharmacology* (3, 1931)
- Mendel, Bruno**, M D Univ of Toronto, Banting and Best Dept of Med Research, 100 College St , Toronto 5, Ontario, Canada *Prof of Cellular Physiology* (2, 1947)
- Mendelson, E S**, B A R F D 2, Telford, Pa *Physiologist, Head of Human Engineering Div , Naval Air Exper Station, Philadelphia, Pa* (1, 1949)
- Mendenhall, Walter L**, M S , M D 9 Acacia St , Cambridge, Mass *Retired Prof of Pharmacology, Boston Univ Med School* (1, 1915, 3R, 1917)
- Mendez, Rafael**, M D Natl Inst of Cardiology , Calzada de la Piedad 300, Mexico D F , Mexico *Head of Dept of Pharmacology* (3, 1944)
- Mendlowitz, Milton**, M D 136 E 64th St , New York City 21 *Adjunct Physician in Mt Sinai Hospital of New York* (1, 1949)
- Meneely, George R**, M D Thayer Veterans Admin Hospital, Nashville, Tenn *Asst Prof of Medicine* (4, 1946)
- Meng, H C**, M D , Ph D Vanderbilt Univ Med School, Dept of Physiology, Nashville 4 *Instructor* (1, 1950)
- Menkin, Vally, M A**, M D Temple Univ School of Medicine, Philadelphia, Pa *Assoc Prof of Exper Pathology* (1, 1932, 4, 1932, 6, 1931)
- Menten, Maud L**, M D Ph D 1608 Sixth Ave , New Westminster, B C , Canada *Retired Prof of Pathology, Univ of Pittsburgh* (1, 1915, 4, 1927)
- Mertz, Edwin T**, Ph D Purdue Univ , Dept of Agricultural Chemistry, W Lafayette, Ind *Assoc Prof* (2, 1950)
- Mettier, Stacy R**, M D Univ of California Hospital, San Francisco *Prof of Medicine* (4, 1932)
- Mettler, Fred A**, Ph D M D Columbia Univ College of Physicians and Surgeons, Dept of Neurology, New York City *Assoc Prof of Anatomy* (1, 1937)
- Meyer, Arthur E**, Ph D Fellows Pharmaceutical Lab , New York City (1, 1948)
- Meyer, Curtis E**, Ph D Upjohn Co , Kalamazoo, Mich *Sr Research Chemist* (2, 1942)
- Meyer, Frieda L**, Ph D U S Dept of Agriculture, Bureau of Human Nutrition, Food and Nutrition Div , Washington 25, D C *Nutrition Specialist* (5, 1949)
- Meyer, Karl**, M D , Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St , New York City 32 *Assoc Prof of Biochemistry, Dept of Medicine* (2, 1934)
- Meyer, Karl F**, M D , Ph D George W Hooper Foundation, Univ of California Med Center, San Francisco *Director* (4, 1930, 6, 1922)
- Meyer, Roland K**, Ph D Univ of Wisconsin, Biology Bldg , Madison 6 *Prof of Zoology* (1, 1949)
- Meyerhof, Otto**, M D Univ of Pennsylvania School of Medicine, Dept of Physiological Chemistry, Philadelphia *Research Prof of Biochemistry* (2, 1941)
- Mezey, Kaàlman**, M D Calle 84, No 9-68, Bogota, Colombia, South America *Prof of Pharmacology, Javeriana Univ Med School* (3, 1950)
- Michel, Harry O**, Ph D Med Div , Biochemical Section, Army Chemical Center, Md *Biochemist* (2, 1949)
- Mickelsen, Olaf**, Ph D Nutrition Branch USPHS, Washington 25, D C *Chief Chemist* (2, 1944)
- Mider, George Burroughs**, M D Strong Memorial Hospital, Rochester 7, N Y *Prof of Cancer Research* (4, 1940)
- Miles, Walter R**, Ph D Yale Univ , 333 Cedar St , New Haven, Conn *Prof of Psychology, School of Medicine and Inst of Human Relations* (1, 1919)
- Milhorat, Ade T**, M D Cornell Univ Med College, New York City 21 *Asst Prof of Medicine and Instr in Pharmacology, Research Fellow, Russell Sage Inst of Pathology* (1, 1934, 3, 1937, 5, 1935)
- Miller, Augustus Taylor, Jr**, Ph D Univ of North Carolina Med School, Chapel Hill *Assoc Prof of Physiology* (1, 1944)
- Miller, Benjamin F**, M D 71 Mt Vernon St , Boston 8, Mass *Assoc Physician, Massachusetts General Hospital, Clin Prof of Medicine (on leave), George Washington Med School* (2, 1938)
- Miller, Carey D**, M S Univ of Hawaii, Honolulu *Prof of Food and Nutrition, Hawaiian Agricultural Exper Station* (5, 1942)
- Miller, C Phillip**, M S , M D Univ of Chicago, Chicago, Ill *Prof of Medicine, Member, Inst of Radiobiology and Biophysics* (4, 1925, 6, 1928)
- Miller, Edgar G , Jr**, Ph D Columbia Univ , 630 W 168th St , New York City *Prof of Biological Chemistry* (2, 1930)
- Miller, Franklin R**, M D Jefferson Med College and Hospital, Div of Hematology, Philadelphia, Pa *Assoc Prof of Medicine* (4, 1940)
- Miller, Frederick R**, M A , M D Univ of Western Ontario, Faculty of Medicine, London, Ontario, Canada *Research Prof of Neurophysiology* (1, 1905)
- Miller, Gail L**, Ph D Inst for Cancer Research, Dept of General Biochemistry, Hasbrook and

- Hartel Aves, Philadelphia 11, Pa Assoc Member (2, 1949)
- Miller, George H, M D American College of Surgeons, 40 E Erie St, Chicago 11, Ill Dir of Educational Activities (3, 1925)
- Miller, George A, Ph D Harvard Univ, Psycho-Acoustic Lab, Cambridge, Mass Research Fellow (1, 1948)
- Miller, H R, M D Montefiore Hospital, 1020 Park Ave, New York City (1, 1947)
- Miller, James A, Ph D Univ of Wisconsin Med School, McArdle Mem Lab for Cancer Research, Madison 6 Assoc Prof of Oncology (2, 1949)
- Miller, Leon L, Ph D, M D Univ of Rochester School of Medicine and Dentistry, P O Box 287, Crittenden Station, Rochester, N Y Assoc Prof of Radiation Biology and Biochemistry (2, 1947)
- Miller, Lila, Ph D Univ of Michigan, Ann Arbor Asst Prof of Biological Chemistry (2, 1946)
- Miller, Lloyd C, Ph D U S Pharmacopeia, 46 Park Ave, New York City 16 Dir of Pharmacopeial Revision (3, 1938)
- Miller, R C, Ph D Pennsylvania State College, State College Prof of Agricultural and Biological Chemistry (5, 1935)
- Miller, Zelma Baker, Ph D 71 Mt Vernon, Boston, Mass (2, 1940)
- Millman, Nathan, M Sc, Ph D 50 Brookside Ave, Apt 6A, Somerville, N J Research Assoc, Div of Physiology and Pharmacology, Ortho Research Foundation, Raritan, N J (1, 1950)
- Mills, Clarence A, Ph D, M D Cincinnati General Hospital, Cincinnati 29, Ohio Prof of Experimental Medicine, Univ of Cincinnati (1, 1921, 2, 1921)
- Minard, David, Ph D, M D Natl Naval Med Center, Naval Med Research Inst, Bethesda, Md Head, Physiology Div (1, 1950)
- Minot, Annie Stone, Ph D Vanderbilt Univ Med School, Nashville, Tenn Assoc Prof of Biochemistry (1, 1923)
- Mirick, George S, M D Johns Hopkins Univ, School of Medicine, Baltimore, Md Assoc Prof of Medicine (6, 1950)
- Mirsky, Alfred E, Ph D Rockefeller Inst for Med Research, 66th St and York Ave, New York City 21 Member (2, 1941)
- Mirsky, I Arthur, M D The Jewish Hospital, Cincinnati, Ohio Dir, May Inst for Med Research, Asst Prof of Biochemistry, Univ of Cincinnati (1, 1936)
- Mitchell, Harold H, M D 120 Lasky Drive, Beverly Hills, Calif (6, 1943)
- Mitchell, Harold H, Ph D Univ of Illinois, 555 Davenport Hall, Urbana Prof of Animal Nutrition (2, 1919, 5, 1933)
- Mitchell, Helen S, Ph D Univ of Massachusetts, Amherst Dean of School of Home Economics (2, 1925, 5, 1933)
- Mitchell, Philip H, Ph D Brown Univ, Providence 12, R I Robert P Brown Prof of Biology (2, 1909)
- Modell, Walter, M D Cornell Univ Med College, 1300 York Ave, New York City, Asst Prof in Clin Pharmacology (3, 1944)
- Moe, Gordon Kenneth, Ph D, M D New York State Univ School of Medicine, Dept of Physiology, Syracuse 10 Prof and Head of Dept (3, 1944)
- Mohn, James F, M D 24 High St, Buffalo, N Y Asst Prof in Bacteriology and Immunology, Univ of Buffalo School of Medicine (6, 1946)
- Molitor, Hans, M D Merck Inst for Therapeutic Research, Rahway, N J Director (1, 1933, 3, 1942)
- Molland, Jacob, M D, Ph D Univ of Oslo, Oslo, Norway Prof of Pharmacology (3, 1948)
- Molnar, George W, Ph D Med Dept, Field Research Lab, Fort Knox, Ky Physiologist (1, 1949)
- Molomut, Norman, Ph D Biological Labs, 16 Clinton St, Brooklyn 2, N Y Dir of Research and of Labs (6, 1942)
- Montgomery, Hugh, M D Univ of Pennsylvania Hospital, 36th and Spruce Sts, Philadelphia Asst Prof of Clin Medicine (1, 1950)
- Moon, Henry D, M A, M D Univ of California Med School, Div of Pathology, San Francisco 22 Asst Clin Prof of Pathology, Pathologist, V A Hospital, City Pathologist (4, 1950)
- Moon, Virgil H, M Sc, M D Univ of Miami, Med Research Unit, Coral Gables 34, Fla Prof of Pathology (4, 1934)
- Moore, Arthur R, Ph D Univ of Portland, Dept of Biology, Portland, Ore (1, 1912)
- Moore, Carl Vernon, M D Washington Univ School of Medicine, St Louis, Mo Prof of Medicine (4, 1938, 5, 1941)
- Moore, Dan H, Ph D U S Navy No 100, c/o Fleet Post Office, New York City (1, 1948)
- Moore, Lane A, Ph D U S Dept of Agriculture, Div of Nutrition and Physiology, Bureau of Dairy Industry, Beltsville, Md Head, Section of Dairy Cattle Nutrition (5, 1940)
- Moore, Robert A, M D Washington Univ Med School, St Louis, Mo Dean and Prof of Pathology (4, 1929)
- Moore, Robert M, M D Univ of Texas Med School, Galveston (1, 1932)
- Moore, Stanford, Ph D Rockefeller Inst for Med Research, York Ave at 66th St, New York City 21 Assoc Member (2, 1949)
- Moorhouse, Victor Henry K, M B Univ of Manitoba, Winnipeg, Manitoba, Canada Prof of Physiology (1, 1912)
- Morales, Manuel F, Ph D Naval Med Research

- Inst , Bethesda 14, Md *Staff Member, General Physiology* (1, 1950)
- More, Robert H** , M Sc , M D Pathological Inst , 3775 University St , Montreal, Quebec, Canada *Prof of Pathology, McGill Univ* (4, 1949)
- Morehouse, Laurence E** , Ph D Univ of Southern California, Los Angeles 7 *Assoc Prof* (1, 1947)
- Morgan, Agnes Fay** , Ph D Univ of California, Berkeley 4 *Prof of Home Economics, Biochemist, Agricultural Exper Station* (2, 1929, 5, 1933)
- Morgan, Charles F** , Ph D Georgetown Univ School of Medicine, Washington, D C *Prof and Chairman of Dept of Physiology* (1, 1948, 3, 1947)
- Morgan, Clifford T** , Ph D Johns Hopkins Univ , Psychology Dept , Baltimore 18, Md (1, 1943)
- Morgulis, Sergius** , Ph D Univ of Nebraska College of Medicine, Omaha 5 *Prof and Chairman of Dept of Biochemistry* (1, 1914, 2, 1916)
- Morison, Robert S** , M D Rockefeller Foundation, 66th St and York Ave , New York City 21 *Asst Dir of Med Sciences* (1, 1938)
- Moritz, Alan R** , M D Western Reserve Univ , Cleveland, Ohio *Prof of Pathology and Dir of the Institute* (4, 1934)
- Morrell, Clarence Allison** , Ph D Dept of Natl Health and Welfare, 35 John St , Ottawa, Ontario, Canada *Dir , Food and Drug Divisions* (3, 1937)
- Morris, Harold P** , Ph D Natl Cancer Inst , Bethesda 14, Md *Principal Biochemist in Nutrition* (2, 1944, 5, 1943)
- Morris, Marion C** , Ph D Public Health Research Inst of City of New York, Foot of East 15th St , New York City *Assoc in Div of Infectious Diseases* (6, 1936)
- Morrison, Dempsey B** , Ph D Univ of Tennessee College of Medicine, Memphis *Assoc Prof of Chemistry* (2, 1936)
- Morrison, James L** , Ph D Emory Univ School of Medicine, Emory University, Ga *Assoc Prof of Pharmacology* (3, 1944)
- Morrison, Peter R** , Ph D Univ of Wisconsin, Madison 6 *Assoc Prof of Zoology and Physiology* (2, 1950)
- Morse, Minerva** Ph D 5525 Kimbark Ave , Chicago, Ill *Research Assoc, Dept of Pediatrics, Univ of Chicago* (2, 1934)
- Morse, Withrow** , Ph D 32 Manchester Rd , Eastchester, via Tuckahoe, N Y *Consultant* (2, 1914)
- Mortimer, Bernard** , Ph D , M D 25 N Ottawa St Joliet, Ill *Cook County Hospital, Chicago* (1, 1936)
- Morton, John J** , M D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Prof of Surgery* (4, 1927)
- Moses, Campbell** , M D , Univ of Pittsburgh School of Medicine, Pittsburgh, Pa *Dir of Ad-*
- dison H Gibson Lab of Applied Physiology* (1, 1948)
- Motley, Hurley L** , Ph D , M D Jefferson Hospital, Philadelphia, Pa *Dir , Cardio-Respiratory Lab , Jefferson Med College and Assoc Prof of Medicine* (1, 1947)
- Moulder, James W** , Ph D Univ of Chicago, Depts of Bacteriology, Parasitology and Biochemistry, 5724 Ellis Ave , Chicago 37, Ill *Asst Prof of Biochemistry* (2, 1950)
- Moulton, C Robert** , Ph D 5602 Dorchester Ave , Chicago, Ill (5, 1933)
- Mountain, Isabel M** Ph D 9 Coolidge Ave , White Plains, N Y (6, 1947)
- Mountcastle, Vernon B** , M D Johns Hopkins Univ Med School, Dept of Physiology, 710 N Washington St , Baltimore 5, Md *Asst Prof of Physiology* (1, 1949)
- Moxon, Alvin L** , Ph D College Station, Brookings, S D *Head, Chemistry Dept , South Dakota Agricultural Exper Station* (2, 1944)
- Moyer, Arden W** , Ph D 407 Mountain View Rd , Englewood, N J *Research Biochemist, Lederle Labs , Pearl River, N Y* (6, 1946)
- Moyer, Carl A** , Ph D 6417 Glenrose Ct , Dallas 1, Tex *Prof of Exper Surgery, Southwestern Med College* (1, 1943)
- Mudd, Stuart, M A** , M D Univ of Pennsylvania, Philadelphia *Prof of Bacteriology* - (1, 1921, 4, 1927, 6, 1927)
- Muehlberger, Clarence W** , Ph D State Health Dept Labs , Lansing, Mich *State Toxicologist* (3, 1928)
- Mueller, J Howard** , Ph D Harvard Med School, 25 Shattuck St , Boston, Mass *Prof of Bacteriology and Immunology* (2, 1922, 4, 1927, 6, 1920)
- Mukherji, B** , D Sc All-India Inst of Hygiene and Public Health, Calcutta *Dir of Biochemical Standardization Lab* (3, 1938)
- Mulder, Arthur G** , Ph D Stritch School of Medicine of Loyola Univ , 706 S Wolcott St , Chicago, Ill *Prof and Chairman of Dept of Physiology* (1, 1937)
- Mulford, Dwight J** , Ph D Kansas Univ Med School, Dept of Biochemistry, Lawrence *Assoc Prof* (2, 1948)
- Mulinos, M G** , M D , Ph D New York Med College, Flower and Fifth Ave Hospitals, Fifth Ave and 105th St , New York City 29 *Assoc Prof of Pharmacology and Physiology* (3, 1931)
- Mull, James W** , Ph D 1870 Grove Ave , Quincy, Ill *Assoc , Quincy Specialties Co* (2, 1937)
- Müller, Otto H** , R N Dr State Univ of New York, Med Center at Syracuse, Dept of Physiology, Syracuse 10 (1, 1947)
- Muller, Robert H** , M D 36 Glen Ridge Pkwy , Montclair, N J *Captain, Med Corps* (6, 1950)
- Mulligan, Richard M** , M D Univ of Colorado

- School of Medicine, 4200 East 9th Ave, Denver
Prof of Pathology (4, 1947)
- Mullin, F J, Ph D Univ of Chicago, Chicago 37,
 Ill *Asst Prof of Physiology* (1, 1937)
- Munro, Muriel Platt, Ph D Jefferson Med Col-
 lege, 1025 Walnut St, Philadelphia 7, Pa *Re-
 search Chemist* (2, 1948)
- Munsell, Hazel E, Ph D Bromatological Lab,
 Natl Inst of Nutrition, Quito, Ecuador *Direc-
 tor* (5, 1933)
- Munson, Paul L, Ph D Harvard School of Dental
 Medicine, 188 Longwood Ave, Boston 15, Mass
Asst Prof of Dental Science (2, 1950)
- Muntwyler, Edward, Ph D State Univ Med
 Center at New York, 350 Henry St, Brooklyn 2,
 N Y *Prof of Biochemistry* (2, 1931)
- Muntz, John A, Ph D 3356 Euclid Heights Blvd,
 Cleveland Heights, Ohio *Asst Prof, Western
 Reserve Univ* (2, 1948)
- Murlin, John R, Ph D Univ of Rochester School
 of Medicine and Dentistry, Rochester, N Y
*Prof Emeritus of Physiology and Dir Emeritus
 of Dept of Vital Economics* (1R, 1906, 2, 1908,
 5, 1933)
- Murphy, Quillian R, M D, Ph D Univ of Wis-
 consin Med School, Dept of Physiology, Mad-
 ison 6 *Asst Prof* (1, 1949)
- Murray, Everitt G D, M A McGill Univ, Mon-
 treal, Quebec, Canada *Prof and Head of Dept
 of Bacteriology and Immunology, Bacteriologist-
 in Chief to the Royal Victoria Children's Memorial
 and Alexandra Hospitals* (6, 1933)
- Murray, F Joseph, Ph D The Wm S Merrell
 Co, Lockland Station, Cincinnati, Ohio *Asst
 Chief Bacteriologist* (6, 1950)
- Mushett, Charles W, Ph D Merck Inst for Ther-
 apeutic Research, Rahway, N J *Head of Dept
 of Pathology* (4, 1948)
- Muus, Jytte, Mag Scient Mount Holyoke Col-
 lege, South Hadley, Mass *Prof of Physiology*
 (2, 1946)
- Myers, Chester N, Ph D 34 Cedar Place, Yonkers
 5, N Y *Chief, Div Chemotherapy, New York
 Skin and Cancer Hospital, Dir of Chemical and
 Clin Research, H A Metz Labs, Inc* (2, 1922)
- Nachmansohn, David, M D Columbia Univ Col-
 lege of Physicians and Surgeons, 630 W 168th
 St, New York City 32 *Research Assoc in Neu-
 rology* (1, 1940)
- Nadler, J Ernest, M D, Med D Sc 80-16 Lefferts
 Blvd, Kew Gardens 15, N Y (3, 1940)
- Nahum, Louis N, M D 1142 Chapel St, New
 Haven, Conn *Asst Prof of Physiology, Yale
 Univ* (1, 1934)
- Najjar, Victor A, M D Johns Hopkins Hospital,
 Baltimore 5, Md *Assoc Prof of Pediatrics*
 (2, 1946)
- Nash, Thomas P, Jr, Ph.D 875 Monroe Ave,
 Memphis, Tenn *Prof of Chemistry, Univ of
 Tennessee College of Medicine, Dean of School
 of Biological Sciences* (2, 1923)
- Nasset, Edmund S, Ph.D Univ of Rochester
 School of Medicine and Dentistry, Rochester,
 N Y *Prof of Physiology* (1, 1932, 5, 1940)
- Nastuk, William L, Ph D Columbia Univ Col-
 lege of Physicians and Surgeons, Dept of Physi-
 ology, 630 W 168th St, New York City 32
Instr in Physiology (1, 1949)
- Natelson, Samuel, Ph D Rockford Memorial Hos-
 pital, 507 Chestnut St, Rockford, Ill *Chairman,
 Dept of Biochemistry* (2, 1950)
- Nathanson, Ira T, M.S, M D Massachusetts
 General Hospital, Boston *Asst in Surgery,
 Instr in Surgery, Harvard Med School* (1, 1943)
- Nathanson, Morris H, M D 6333 Wilshire Blvd,
 Los Angeles, Calif *Assoc Clin Prof of Medi-
 cine, Univ of Southern California School of
 Medicine* (3, 1940)
- Necheles, Heinrich, M D, Ph D Michael Reese
 Hospital, Chicago, Ill *Dir of Dept of Gastro-
 intestinal Physiology, Professorial Lecturer in
 Physiology, Univ of Chicago* (1, 1929)
- Neff, William D, Ph D Univ of Chicago, Dept
 of Psychology, Faculty Exchange, Chicago 37,
 Ill *Assoc Prof* (1, 1950)
- Neil, James M, Ph D Cornell Univ Med Col-
 lege, 1300 York Ave, New York City *Prof
 of Bacteriology and Immunology* (6, 1930)
- Neilson, Charles Hugh, Ph D, M D Humboldt
 Bldg, St Louis, Mo *Assoc Dean and Prof
 of Medicine, St Louis Univ Med School* (2,
 1906)
- Nelson, Arthur A, M D, Ph D Federal Security
 Agency, Food and Drug Admin, Div of Phar-
 macology, Washington 25, D C *Med Officer
 (Pathology)* (4, 1942)
- Nelson, Carl Ferdinand, M D, Ph D Univ of
 Kansas, Dept of Biochemistry, Lawrence *Prof
 of Physiological Chemistry* (2, 1914)
- Nelson, Carl T, M A, M D Harkness Pav
 Presbyterian Hosp, 180 Ft Washington Ave,
 New York City 32 *Dermatologist* (6, 1943)
- Nelson, Erwin E, Ph D, M D Food and Drug
 Admin, Washington 25, D C *Med Dir, Ad-
 junct Clin Prof of Pharmacology, George Wash-
 ington Univ School of Medicine* (3, 1924)
- Nelson, E M, Ph D Food and Drug Admin
 Washington 25, D C *Chief, Div of Nutrition*
 (2, 1927, 5, 1933)
- Nelson, John B, Ph D Rockefeller Inst for Med
 Research, New York City *Assoc Member* (4,
 1934)
- Nelson, John M, Ph D Columbia Univ, New
 York City 27 *Prof Emeritus of Organic Chemis-
 try* (2, 1923)
- Nelson, Marjorie M, Ph D Univ of California,
 Inst of Exper Biology, Berkeley *Research
 Assoc* (5, 1950)

- Nelson, Norton**, Ph D New York Univ College of Medicine, 477 First Ave, New York City 16 *Assoc Prof of Industrial Medicine* (2, 1946)
- Nelson, P Mabel**, Ph D Iowa State College, Ames *Dean, Div of Home Economics* (5, 1934)
- Nelson, Tell, M A**, M D 1415 Kalakauna Ave, Honolulu 19, T.H. *Practicing Physician* (6, 1938)
- Nelson, Victor E**, M S 423 Niagara St, Eau Claire, Wis (2, 1924)
- Nelson, Warren O**, Ph D Univ of Iowa School of Medicine, Iowa City *Prof of Anatomy* (1, 1937)
- Neter, Erwin**, M D Children's Hospital, 219 Bryant St, Buffalo, N Y *Attending Bacteriologist* (6, 1937)
- Nettleship, Anderson**, M D Univ of Arkansas School of Medicine, Little Rock *Prof and Head of Dept of Pathology* (4, 1942)
- Neuberg, Carl**, Ph D, M D Med, Chem D 536 W 113th St, New York City 25 *Research Prof, New York Univ* (2, 1944)
- Neuman, William F**, Ph D, Univ of Rochester School of Medicine and Dentistry, Rochester 20, N Y *Assoc Prof of Pharmacology* (2, 1949)
- Neumann, Charles**, M D 525 E 68th St, New York City 21 *Resident Surgeon, New York Hospital, Instr in Surgery, New York Univ Post-Grad Med School* (1, 1944)
- Neurath, Hans**, Ph D Univ of Washington School of Medicine, Dept of Biochemistry, Seattle 5 *Prof and Exec Officer of Dept* (2, 1940, 6, 1944)
- Neuwelt, Frank**, M D 504 Broadway, Gary, Ind *Research Assoc, Dept of Gastrointestinal Research, Michael Reese Hospital* (1, 1940)
- Neuwirth, Isaac**, Ph D 209 E 23rd St, New York City 10 *Prof of Pharmacology, New York Univ College of Dentistry* (2, 1924, 3, 1931)
- Newman, Elliot V**, M D, Johns Hopkins Hospital, Baltimore, Md *Asst Prof of Medicine* (1, 1948)
- Newman, Henry W**, M D Stanford Med School, Clay and Webster Sts, San Francisco 15, Calif *Assoc Prof of Medicine* (3, 1949)
- Nice, Leonard B**, Ph D Chicago Med School, 710 S Wolcott Ave, Chicago, Ill *Prof of Physiology and Pharmacology* (1, 1921)
- Nicholas, John S**, Ph D Yale Univ, Osborn Zoological Lab, New Haven, Conn *Bronson Prof of Comparative Anatomy* (1, 1927)
- Nicholson, Hayden C**, M S, M D Univ of Arkansas, School of Medicine, Little Rock *Dean* (1, 1932)
- Nickerson, John L**, Ph D Columbia Univ, 630 W 165th St, New York City 32 *Assoc Prof of Physiology* (1, 1945)
- Nickerson, Mark**, Ph D M D Univ of Utah School of Medicine, Salt Lake City *Assoc Prof of Pharmacology* (3, 1947)
- Nicoll, Paul A**, Ph D Indiana Univ, Bloomington *Asst Prof of Physiology* (1, 1945)
- Niemann, Carl G**, Ph D California Inst of Technology, Pasadena 4 *Prof of Organic Chemistry* (2, 1940)
- Nigg, Clara**, Ph D E R Squibb and Sons, New Brunswick, N J *Head of Depts of Bacteriology and Virology, and of Microbiological Development* (6, 1929)
- Nims, Leslie F**, Ph D Brookhaven Natl Lab, Biology Dept, Upton, Long Island, N Y *Acting Head of Dept* (1, 1940)
- Noble, Robert Laing**, M D, Ph D Univ of Western Ontario, Dept of Med Research, London, Ontario, Canada (1, 1941)
- Noell, Werner K**, M D U S A F School of Aviation Medicine, Randolph Field, Tex *Research Physiologist* (1, 1950)
- Nord, F F**, Ph D Fordham Univ, Dept of Organic Chemistry, New York City *Prof of Organic Chemistry and Enzymology* (2, 1940)
- Norris, Earl R**, Ph D Univ of Washington, Seattle *Prof of Biochemistry and Exec Officer of Dept* (2, 1938)
- Norris, L C**, Ph D Cornell Univ, Rice Hall, Ithaca, N Y *Prof of Nutrition* (2, 1939, 5, 1934)
- Northrop, J H**, Ph D, Sc D Univ of California, Berkeley 4 *Visiting Prof of Bacteriology, Member of Rockefeller Inst* (2, 1938)
- Northup, David W**, Ph D West Virginia Univ Med School, Morgantown *Prof of Physiology* (1, 1936)
- Novy, F G**, M D, Sc D 721 Forest Ave, Ann Arbor, Mich *Dean Emeritus of Med School and Prof Emeritus of Bacteriology, Univ of Michigan* (2, 1906, 4R, prior to 1919)
- Nowinski, W W**, Ph D Univ of Texas School of Medicine, Galveston *Research Assoc* (1, 1948)
- Nungester, Walter James**, Ph D, M D Univ of Michigan, Dept of Bacteriology, Ann Arbor *Professor* (6, 1949)
- Oberst, Fred W**, Ph D Med Div, Army Chemical Center, Md *Chief, Gassing Section* (2, 1936, 3, 1949)
- Ochoa, Severo**, M D New York Univ College of Medicine, 477 First Ave, New York City 16 *Prof of Pharmacology* (2, 1942)
- Ogden, Eric** Ohio State Univ College of Medicine, Columbus 10 *Prof of Physiology* (1, 1941)
- O'Hare, James P**, M D 520 Commonwealth Ave, Boston, Mass *Physician, Peter Bent Brigham Hospital, Lecturer in Medicine, Harvard Med School* (4, 1927)
- Ohlson, Margaret A**, Ph D Michigan State College, Dept of Foods and Nutrition, East Lansing *Prof and Head of Dept of Foods and Nutrition* (5, 1945)
- Okey, Ruth**, Ph D Univ of California, 1581 Life

- Sciences Bldg, Berkeley 4 *Prof of Home Economics* (2, 1922, 5, 1933)
- Olcott, Harold S, Ph D U S Dept of Agriculture, Western Regional Research Lab, Albany 6, Calif *Head of Vegetable Processing Div* (2, 1935)
- Oldham, Helen, Ph D Univ of Chicago, Chicago, Ill *Asst Prof, Dept of Home Economics* (5, 1946)
- Oleson, J J, Ph D American Cyanamid Co, Lederle Labs Div, Pearl River, N Y *Head, Dept of Nutrition and Exper Biology* (2, 1950)
- Olitsky, Peter K, M D Rockefeller Inst for Med Research, 66th St and York Ave, New York City *Member* (6, 1917)
- Oliver, Jean Redman, M D Hoagland Lab, 335 Henry St, Brooklyn, N Y *Prof of Pathology, N Y State Med Center at New York City, College of Medicine* (1, 1924, 4, 1924)
- Oliver, Wade W, M D Rockefeller Foundation, New York City *Assoc Dir of Div of Med Sciences* (4, 1925)
- Olmsted, J M D, Ph D Univ of California, Berkeley *Prof of Physiology* (1, 1920)
- Olsen, Norman S, Ph D Thayer Veterans Admin Hospital, Research Lab, Nashville 5, Tenn *Appointment in Dept of Biochemistry, Vanderbilt Univ* (1, 1948, 2, 1949)
- Olson, Byron J, Ph D, M D National Insts of Health, Bethesda, Md *Surgeon, Div of Infectious Diseases* (6, 1948)
- Olson, Carl, Jr, D V M, Ph D Univ of Nebraska, Lincoln *Chairman of Dept of Animal Pathology and Hygiene* (4, 1937)
- Opdyke, David F, Ph D Western Reserve Univ Med School, Cleveland 6, Ohio *Assoc Prof of Physiology* (1, 1945)
- Opie, Eugene L, M D, Sc D Rockefeller Inst for Med Research, 66th St and York Ave, New York City 21 *Member* (1R, 1906, 4, 1913, 6R, 1923)
- Oppenheimer, Enid Tribe 124 E 61st St, New York City *Instr in Physiology, Columbia Univ* (1, 1932)
- Oppenheimer, Ernst, M D Ciba Pharmaceutical Products, Inc, Lafayette Park, Summit, N J *Vice-Pres in charge of Med Research* (3, 1944)
- Oppenheimer, Morton Joseph, Ed M, M D 3400 N Broad St, Philadelphia, Pa *Prof of Physiology, Temple Univ School of Medicine* (1, 1942)
- Orent-Keiles, Elsa, D Sc U S Dept of Agriculture, Bureau of Human Nutrition and Home Economics, Beltsville, Md *Nutrition Chemist, Foods and Nutrition Div* (2, 1935, 5, 1935)
- Ort, John M, Ph D 401 Codwise Ave, New Brunswick, N J *Dir of Research, Carroll Dunham Smith Pharmacal Co* (2, 1932)
- Orten, Aline Underhill, Ph D Wayne Univ College of Medicine, Detroit 26, Mich *Research Assoc, Dept of Physiological Chemistry* (5, 1946)
- Orten, James M, Ph D Wayne Univ College of Medicine, Detroit 26, Mich *Assoc Prof of Physiological Chemistry* (2, 1936, 5, 1937)
- Orth, O Sidney, Ph D, M D Univ of Wisconsin, S M I, Madison *Prof of Pharmacology* (1, 1942, 3, 1944)
- Osborne, Stafford L, Ph D Northwestern Univ Med School, 303 E Chicago Ave, Chicago, Ill *Prof and Chairman of Dept of Physical Medicine* (1, 1941)
- Oser, Bernard L, Ph D Food Research Labs, Inc, 48-14 33rd St, Long Island City 1, N Y *Director* (5, 1945)
- Osler, Abraham G, Ph D Johns Hopkins Hospital, Monument and Wolfe Sts, Baltimore, Md *Dir of Serologic Lab* (6, 1949)
- Oster, Robert H, Ph D Univ of Maryland Med School, Greene and Lombard Sts, Baltimore *Asst Prof of Physiology* (1, 1938)
- Osterberg, Arnold E, Ph D Abbott Labs, Med Dept, N Chicago, Ill *Assoc in Med Dept* (2, 1933)
- Osterhout, Marian I Rockefeller Inst for Med Research, 66th St and York Ave, New York City 21 *Assoc, Div of General Physiology* (1, 1927)
- Osterhout, W J V, Ph D Rockefeller Inst for Med Research, 66th St and York Ave, New York City 21 *Member Emeritus* (1, 1910)
- Otis, Arthur B, Ph D Univ of Rochester, Rochester 7, N Y *Asst Prof of Physiology* (1, 1946)
- Ott, Walther H, Ph D Merck Inst for Therapeutic Research, Rahway, N J *Head of Dept of Biological Control and Poultry Nutrition* (5, 1949)
- Overman, Richard R, Ph D Univ of Tennessee College of Medicine, Division of Physiology, Memphis *Assoc Prof* (1, 1946)
- Owen, Seward E, Ph D 418 S 20th Ave, Maywood, Ill (1, 1938)
- Pace, Donald M, Ph D Univ of Nebraska College of Pharmacy, Dept of Physiology and Pharmacology, Lincoln *Assoc Prof of Physiology* (1, 1944)
- Pace, Nello, Ph D Univ of California, Berkeley 4 *Asst Prof of Physiology* (1, 1947)
- Pack, George T, M D 139 E 36th St, New York City 16 *Fellow in Cancer Research, Memorial Hospital* (1, 1924)
- Packchamian, Ardzoony, Ph D Univ of Texas School of Medicine, Galveston *Assoc Prof of Bacteriology and Tropical Medicine, Dir of Lab of Microbiology* (6, 1943)
- Page, Edouard, Ph D Laval Univ Med School, Dept of Biochemistry, Quebec, Canada (1, 1947)
- Page, Ernest W, M D Univ of California Hos

- pital, Dept of Obstetrics and Gynecology, San Francisco 22 *Asst Prof* (1, 1947)
- Page, Irvine H**, M D Cleveland Clinic Foundation, 2040 E 93rd St, Cleveland 6, Ohio *Dir of Research* (1, 1937, 2, 1932)
- Painter, Elizabeth E**, Ph D Univ of Illinois School of Medicine, 1853 W Polk St, Chicago *Asst Prof of Physiology* (1, 1941)
- Palmer, John W**, Ph D E R Squibb and Sons, Georges Rd, New Brunswick, N J (6, 1949)
- P'An, S Y**, M D, Chas Pfizer and Co, Inc, Dept of Pharmacology, 11 Bartlett St, Brooklyn 6, N Y *In Charge, Dept of Pharmacology* (3, 1941)
- Pangborn, Mary C**, Ph D New York State Dept of Health, Div of Labs and Research, New Scotland Ave, Albany, N Y *Sr Biochemist* (2, 1941)
- Papageorge, Evangeline**, Ph D Emory Univ School of Medicine, Dept of Biochemistry, Emory Univ, Georgia *Assoc Prof* (2, 1950)
- Pappenheimer, A M, Jr**, Ph D New York Univ College of Medicine, 477 First Ave, New York City 16 *Prof of Microbiology* (2, 1941, 6, 1938)
- Pappenheimer, Alwin M**, M D 45 Holden St, Cambridge, Mass *Prof Emeritus of Pathology, Columbia Univ* (4, 1922)
- Pappenheimer, John R**, Ph D Harvard Med School, Boston, Mass *Assoc in Physiology* (1, 1946)
- Papper, E M**, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City *Prof of Anesthesiology* (3, 1949)
- Park, Edwards A**, M D Johns Hopkins Hospital, Baltimore, Md *Prof Emeritus of Pediatrics, Johns Hopkins Univ* (4, 1923)
- Parker, George H**, Sc D 16 Berkeley St, Cambridge, Mass *Prof Emeritus of Zoology, Harvard Univ* (1R, 1909)
- Parker, Robert F**, M D Univ Hosps, 2065 Adelbert Rd, Cleveland, Ohio *Assoc Prof of Microbiology and Medicine* (4, 1942, 6, 1935)
- Parkins, William M**, Ph D Route 2, Chariton, Iowa (1, 1939)
- Parpart, Arthur K**, Ph D Princeton Univ, Guyot Hall, Princeton, N J *Prof of Physiology* (1, 1937)
- Parr, Leland W**, Ph D George Washington Univ School of Medicine, 1335 H St NW, Washington, D C *Prof of Bacteriology* (4, 1940)
- Parrack, Horace O**, Ph D Wright-Patterson Air Force Base Aero Med Lab, Dayton, Ohio *Research Physiologist* (1, 1948)
- Parsons, Helen T**, M D, Ph D Univ of Wisconsin, Madison *Prof of Home Economics, in charge of Purnell Research in Nutrition* (2, 1929, 5, 1933)
- Parsons, Robert J**, M D Highland Alameda County Hospital, 2701 14th Ave, Oakland, Calif *Pathologist, Dir of Labs* (4, 1939)
- Paschkis, Karl E**, M D Jefferson Med College, 1025 Walnut St, Philadelphia 7, Pa *Asst Prof of Medicine and Assoc in Physiology, Chief of Endocrine Clinic, Jefferson Hospital* (1, 1942)
- Patt, Harvey M**, Ph D Argonne Natl Lab, Chicago, Ill *Physiologist* (1, 1948)
- Patterson, Thos L**, Ph D, Sc D Wayne Univ College of Medicine, 1512 St Antoine St, Detroit 26, Mich *Research Prof of Physiology, Prof of Oro-Physiology and Dir of Dental Research, Univ of Detroit School of Dentistry* (1, 1920)
- Patterson, Wilbur I**, Ph D Food and Drug Admin, Washington 25, D C *Chief, Organic Analytical Methods Branch, Div of Food* (2, 1948)
- Patton, H D**, Ph D, M D Univ of Washington School of Medicine, Dept of Physiology and Biophysics, Seattle 5 *Assoc Prof* (1, 1947)
- Paul, John R**, M A, M D Yale Univ Med School, 333 Cedar St, New Haven, Conn *Prof of Preventive Medicine* (4, 1927, 6, 1937)
- Pearce, John Musser**, M D 525 E 68th St, New York City 21 *Prof of Pathology, Cornell Univ Med College, Attending Pathologist, New York Hospital* (4, 1942)
- Pearce, Louise**, M D Trevenna Farm, Belle Mead, N J *Assoc Member in Pathology and Bacteriology, Rockefeller Inst for Med Research* (4, 1925)
- Pearcy, Frank**, Ph D, M D 2606 Oak Lawn Ave, Dallas, Tex (1, 1928)
- Pearlman, William H**, Ph D Jefferson Med College, 1025 Walnut St, Philadelphia 7, Pa *Assoc Prof, Biochemistry Dept* (2, 1946)
- Pearse, Herman E**, M D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Prof of Surgery* (4, 1932)
- Pearson, Harold E**, M D, M P H Univ of Southern California Med School, Los Angeles *Assoc Prof of Bacteriology, Med Microbiologist, Los Angeles County Hospital* (6, 1948)
- Pearson, P B**, Ph D U S Atomic Energy Commission Div of Biology and Medicine, Washington 25, D C *Chief of Biology Branch* (2, 1944, 5, 1940)
- Pease, Marshall C, Jr**, M D Branchville Rd, R F D 4, Ridgely, Conn *Historian of American Acad of Pediatrics* (6, 1920)
- Peck, Robert L**, Ph D 939 Madison Ave, Plainfield, N J *Sr Chemist, Merck and Co, Inc* (2, 1947)
- Penfield, Wilder G**, M D, D Sc McGill Univ, Montreal, Quebec, Canada *Prof of Neurology and Neurosurgery* (1, 1932)
- Pennington, Mary Engle**, Ph D 233 Broadway, New York City 7 *Consultant in Connection with*

- the Handling, Transportation and Storage of Perishables* (2, 1908)
- Penrod, Kenneth E**, Ph D Duke Univ School of Medicine, Durham, N C *Assoc Prof of Physiology* (1, 1946)
- Peoples, S Anderson**, M D Univ of California, School of Veterinary Medicine, Dept of Pharmacology, Davis *Prof of Comparative Pharmacology* (3, 1937)
- Perkins, John F, Jr**, M D 5621 S Kenwood Ave, Chicago 37, Ill *Asst Prof of Physiology, Univ of Chicago* (1, 1950)
- Perlman, Ely**, M D 77-14 113th St, Forest Hills, L I, N Y *Research Assoc Mt Sinai Hospital* (6, 1944)
- Permar, Howard H**, M D Pathologic Labs, Mercy Hospital, Pittsburgh, Pa *Dir of Labs* (4, 1925)
- Petermann, Mary L**, Ph D Sloan-Kettering Inst for Cancer Research, 444 E 68th St, New York City 21 *Associate* (2, 1947)
- Peters, John P**, M D 123 Marvel Rd, New Haven 15, Conn *John Slade Ely Prof of Medicine, Yale Univ School of Medicine* (2, 1922)
- Peters, Lawrence**, Ph D Western Reserve Univ Med School, Dept of Pharmacology, 2109 Adelbert Rd, Cleveland 6, Ohio *Asst Prof of Pharmacology* (3, 1946)
- Peterson, Lysle H**, M D Univ of Pennsylvania Med School, Dept of Physiology, Philadelphia 4 *Research Fellow in Physiology* (1, 1950)
- Peterson, William H**, Ph D Univ of Wisconsin, Biochemistry Bldg, Madison *Prof of Biochemistry* (2, 1919, 5, 1936)
- Pett, L B**, M D, Ph D Dept of Natl Health and Welfare, Ottawa, Ontario, Canada *Dir of Nutrition* (2, 1937, 5, 1945)
- Pfeiffer, Carl C**, Ph D, M D Univ of Illinois, 1853 W Polk St, Chicago 12 *Prof and Chairman of Dept of Pharmacology* (3, 1938)
- Pfiffner, Joseph J**, Ph D Parke, Davis & Co, Research Labs, Detroit 32, Mich *Research Chemist* (1, 1931, 2, 1931, 5, 1946)
- Phatak, Nilkanth M**, Ph D Univ of Oregon, School of Dentistry, Portland *Assoc Prof and Head of Dept of Pharmacology* (3, 1941)
- Philips, Frederick S**, Ph D Sloan-Kettering Inst for Cancer Research, 444 E 68th Street, New York City 21 *Assoc Member* (3, 1947)
- Phillips, Paul H**, Ph D Univ of Wisconsin, Madison *Prof of Biochemistry* (2, 1940, 5, 1938)
- Phillips, Robert Allan**, M D U S Naval Med Research Unit No 3, American Embassy at Cairo, Egypt, %Navy Pouch Section, Navy Dept Washington 25, D C (1, 1938)
- Pick, Ernst Peter**, M D 19 E 98th St, New York City *Assoc Pharmacologist, Mt Sinai Hospital* (3, 1940)
- Pierce, Harold B**, Ph D Univ of Vermont College of Medicine, Burlington *Prof and Chairman of Dept of Biochemistry* (2, 1929, 5, 1933)
- Pierce, Harold Fisher**, Ph D, M D State Veterans Hospital, Rocky Hill Conn (1, 1928)
- Pierce, Ira H**, Ph D Univ of Iowa, Iowa City *Assoc Prof of Pharmacology* (3, 1933)
- Pigman, William W**, Ph D Univ of Alabama, Med-Dent Schools, Biochemistry Dept, Birmingham *Assoc Prof* (2, 1950)
- Pike, Frank H**, Ph D 437 W 59th St, New York City 19 *Assoc Prof of Physiology, Columbia Univ* (1, 1907)
- Pitcher, J Douglas**, M D City Hospital, Scranton Rd, Cleveland, Ohio *Assoc Prof of Pediatrics, Western Reserve Univ School of Medicine* (3R, 1911)
- Pillemer, Louis**, Ph D Western Reserve Univ, Inst of Pathology, Cleveland, Ohio *Prof of Biochemistry* (2, 1950, 6, 1942)
- Pincus, Gregory**, Sc D Worcester Foundation for Exper Biology, 222 Maple Ave, Shrewsbury, Mass (1, 1935)
- Pincus, I J**, M D Jefferson Med College, Philadelphia, Pa *Assoc in Physiology* (1, 1948)
- Pinkerton, Henry**, M D St Louis Univ School of Medicine, St Louis, Mo *Prof of Pathology* (4, 1931)
- Pinkston, James O**, Ph D American Univ of Beirut, Beirut, Lebanon *Prof of Physiology* (1, 1936, 3, 1939)
- Pinson, Ernest A**, Ph D 2118 C-44th St, Los Alamos, N Mex (1, 1943)
- Pittman, Martha S**, Ph D Manhattan, Kan (5, 1933)
- Pitts, Robert F**, Ph D, M D Cornell Univ Med College, 1300 York Ave, New York City *Prof and Head of Dept of Physiology and Biophysics* (1, 1934)
- Plummer, Albert J**, M D, Ph D Ciba Pharmaceutical Products, Inc, Summit, N J *Sr Pharmacologist* (3, 1950)
- Pollack, Herbert**, Ph D, M D 45 E 66th St, New York City 21 *Assoc Physician and Chief of Metabolism Clinics, Mt Sinai Hospital* (1, 1933, 5, 1935)
- Pomerat, Charles Marc**, Ph D Univ of Texas Med School, Galveston *Prof of Anatomy* (1, 1944)
- Pommerenke, W T**, Ph D M D Univ of Rochester School of Medicine and Dentistry, Rochester 7, N Y *Assoc Prof of Obstetrics and Gynecology* (1, 1947)
- Pond, Samuel E**, Ph D 400 S Main St, East Hartford, Conn *Consulting Engineer, P and W A Div, United Aircraft Corp* (1, 1924)
- Ponder, Eric**, M D, Sc D Nassau Hospital, Mineola, Long Island, N Y (1, 1931)
- Poppen, John R**, M D Aero Med Acceleration

- Lab , Naval Air Development Center, Johnsville, Pa *Director* (1, 1948)
- Popper, Hans**, Ph D , M D Cook County Hospital, 1825 W Harrison St , Chicago 12, Ill *Dir of Dept of Pathology and Scientific Dir of Hektoen Inst for Med Research, Assoc Prof of Pathology, Northwestern Univ Med School* (4, 1942)
- Porter, Eugene L** , Ph D Univ of Texas Med Branch, Galveston *Prof of Physiology* (1, 1913)
- Porter, J R** , Ph D State Univ of Iowa, College of Medicine, Iowa City *Prof of Bacteriology* (6, 1950)
- Porter, Thelma**, Ph D Univ of Chicago, Chicago, Ill *Prof and Chairman of Dept of Home Economics* (5, 1944)
- Post, Robert Lickely**, M D 6310 Vanderbilt Med School, Nashville 4, Tenn *Instr in Physiology* (1, 1950)
- Poth, Edgar J** , M D , Ph D Univ of Texas Med School, Galveston *Prof of Surgery* (1, 1946)
- Potter, Truman S** , M D 117 Northampton Rd , Amherst, Mass *Independent Research Worker* (6, 1939)
- Potter, Van R** , Ph.D Univ of Wisconsin Med School, McArdle Memorial Lab , Madison *Prof of Oncology* (2, 1941)
- Powell, Horace M** , Sc D 5565 Washington Blvd , Indianapolis, Ind *Head Bacteriologist, Eli Lilly & Co* (6, 1934)
- Power, Marschelle H** , Ph D Mayo Clinic, Rochester, Minn *Prof of Physiological Chemistry, Mayo Foundation, Univ of Minnesota* (2, 1932)
- Pratt, Frederick H** , M D Boston Univ School of Medicine, Boston, Mass *Prof Emeritus of Physiology* (1R, 1919)
- Pratt, Joseph H** , M D , Sc D New England Med Center, 25 Bennet St , Boston, Mass *Physician-in-Chief, Boston Dispensary and Joseph H Pratt Diagnostic Clinic, Prof Emeritus of Medicine, Tufts Med School* (1, 1910, 3, 1910, 4, 1927)
- Preisler, Paul W** , Ph D , Washington Univ School of Medicine, 4580 Scott Ave , St Louis 10, Mo *Research Assoc , Biochemistry* (2, 1931)
- Pressman, David**, Ph D Sloan-Kettering Inst for Cancer Research, 444 East 68 St , New York City 21 *Sr Fellow in Cancer Research* (6, 1949)
- Price, Clifford W** , Ph D U S Food and Drug Admin , Washington, D C *Bacteriologist, Antibiotics Analyst, Div of Penicillin Control and Immunology* (6, 1946)
- Prinzmetal, Myron**, M.A., M D 300 S Beverly Drive, Beverly Hills, Calif *Sr Attending Physician, Cedars of Lebanon Hospital, Los Angeles* (3, 1941)
- Prosser, C Ladd**, Ph D Univ of Illinois, Natural History Bldg , Urbana (1, 1935)
- Puestow, Charles B** , M D , Ph D Univ of Illinois College of Medicine, 1853 W Polk St , Chicago *Asst Prof of Surgery* (1, 1934)
- Pugsley, L I** , Ph D Dept of Natl Health and Welfare, Food and Drug Lab , Ottawa, Ontario, Canada *Chief of Lab Service* (2, 1937)
- Putnam, Frank W** , Ph D Univ of Chicago, 947 E 58th St , Chicago 37, Ill *Asst Prof of Biochemistry* (2, 1947)
- Quackenbush, Forrest W** , Ph D R-2, Brookston, Ind *Prof and Head of Dept of Agricultural Chemistry, Purdue Univ* (2, 1946)
- Quaife, Mary L** , Ph D Distillation Products, Inc , Div of Eastman Kodak Co , Rochester 3, N Y *Sr Research Chemist, Dept of Biochemistry* (2, 1948)
- Quastel, J H** , D Sc , Ph D Research Inst , Montreal General Hosp , 3619 University St Montreal, Quebec, Canada *Prof of Biochemistry, McGill Univ* (2, 1948)
- Queen, Frank B** , M D Univ of Oregon School of Medicine, 3181 SW Sam Jackson Park Rd , Portland *Prof of Pathology* (4, 1941)
- Quick, Armand J** , M D , Ph D Marquette Med School, 561 N 15th St , Milwaukee 3, Wis *Prof and Dir of Dept of Biochemistry* (2, 1932, 3, 1937)
- Quigley, J P** , Ph D Univ of Tennessee, Memphis 3 *Prof and Chief of Div of Physiology* (1, 1929, 3, 1945)
- Quilligan, J J** , M D , M B Univ of Michigan, School of Public Health, Observatory St , Ann Arbor *Research Assoc , Dept of Epidemiology, Instr , Dept of Pediatrics* (6, 1950)
- Qumby, Freeman Henry**, Ph D Office of Naval Research, Code 441, Navy Dept , Washington 25, D C *Acting Head, Physiology Branch* (1, 1950)
- Quinby, William C** , M D Harvard Univ Med School, Boston, Mass *Clin Prof of Genito-urinary Surgery* (1R, 1916)
- Quinn, Edmond John**, Ph D 106 N Lee Ave , Rockville Center, Long Island, N Y *Medicinal Sales Div , Merck & Co , Inc , Rahway, N J* (2, 1927, 5, 1933)
- Raab, Wilhelm**, M D Univ of Vermont College of Medicine, Div of Exper Medicine, Burlington *Prof , Head of Division and of Cardiovascular Clin Research Unit* (1, 1949)
- Rabinowitch, I M** , D Sc , M D C M 1020 Med Arts Bldg , Sherbrooke and Guy Sts , Montreal, Quebec, Canada *Assoc Prof of Medicine and Lecturer in Med Jurisprudence and Toxicology, McGill Univ , Dir , Inst for Research, Montreal General Hospital* (2, 1928, 5, 1933)
- Rachele, Julian R** , Ph D Cornell Univ Med College, 1300 York Ave , New York City 21 *Assoc Prof of Biochemistry* (2, 1948)
- Rackemann, Francis M** , M D 263 Beacon St , Boston, Mass *Physician, Massachusetts General*

- Hospital, Lecturer in Medicine, Harvard Med School* (6, 1923)
- Racker, Efraim, M D** New York Univ College of Medicine, New York City 16 *Asst Prof of Microbiology* (2, 1948)
- Raffel, Sidney, Sc D, M D** Stanford Univ, Dept of Bacteriology and Exper Pathology, Stanford Univ, Calif *Asst Prof* (6, 1938)
- Rahn, Hermann, Ph D** Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Asst Prof of Physiology* (1, 1944)
- Rake, Geoffrey W, M B** Squibb Inst for Med Research, Div of Microbiology, New Brunswick, N J *Head of Div* (6, 1939)
- Rakestraw, Norris W, Ph D** Univ of California, Scripps Inst of Oceanography, LaJolla *Prof of Chemistry* (2, 1925)
- Rakieten, Nathan, Ph D** Bristol Labs, Inc, P O Box 657, Syracuse 2, N Y *Pharmacologist and Toxicologist* (1, 1941)
- Rall, Elaine P, M D** 477 First Ave, New York City *Assoc Prof of Medicine, New York Univ College of Medicine* (1, 1934, 5, 1933)
- Ralston, H J, Ph D** College of Physicians and Surgeons, 344 14th St, San Francisco 3, Calif *Assoc Prof of Physiology* (1, 1947)
- Rammelkamp, Charles H, Jr, M D** Western Reserve Univ, Dept of Preventive Medicine, Cleveland 6, Ohio *Assoc Prof of Medicine* (6, 1943)
- Ramsey, Robert Weberg, Ph D** Med College of Virginia, Richmond *Assoc Prof of Physiology and Pharmacology* (1, 1939)
- Randall, Lowell O, Ph D** Hoffmann-LaRoche, Inc, Nutley 10, N J *Pharmacologist* (2, 1939, 3, 1950)
- Randall, Walter C, Ph D** St Louis Univ School of Medicine, 1402 S Grand Blvd, St Louis, Mo *Instr in Physiology* (1, 1943)
- Randall, William A, Ph D** Food and Drug Admin, Washington 25, D C *Bacteriologist, Div of Penicillin Control and Immunology* (6, 1946)
- Rane, Leo, Ph D** Lederle Labs, Inc, Pearl River, N Y *Dept Head, Normal Blood Plasma* (6, 1942)
- Rantz, Lowell A, M D** Stanford Univ School of Medicine, San Francisco 15, Calif *Assoc Prof of Medicine* (3, 1946)
- Rapoport, Samuel, M D, Ph D** Children's Hospital Research Foundation, Elland and Bethesda, Cincinnati, Ohio *Assoc Prof of Pediatrics and Asst Prof of Biochemistry, Univ of Cincinnati* (2, 1941)
- Rapport, David, M D** 136 Harrison Ave, Boston, Mass *Prof of Physiology, Tufts College Med School* (1, 1922)
- Rapport, Maurice M, Ph D** Columbia Univ College of Physicians and Surgeons, Dept of Biochemistry, 630 W 168th St, New York City 32 *Research Assoc* (2, 1950)
- Raska, Sigwin, Ph D** 545 Graceland Ave, Des Plaines, Ill (1, 1947)
- Rasmussen, A F, Ph D, M D** Univ of Wisconsin Med School, Dept of Med Microbiology, Madison *Assoc Prof* (6, 1949)
- Rasmussen, Andrew Theodore, Ph D** Univ of Minnesota Med School, Minneapolis *Prof of Neurology* (1, 1919)
- Ratcliffe, Herbert L, D Sc** Univ of Pennsylvania, Dept of Pathology, Philadelphia 4 *Assoc Prof of Comparative Pathology, Pathologist, Zoological Society of Philadelphia* (4, 1950)
- Ratner, Bret, M D** 50 E 78th St, New York City *Prof of Pediatrics, New York Univ College of Medicine* (4, 1940, 6, 1928)
- Ratner, Sarah, Ph D** New York Univ College of Medicine, 477 First Ave, New York City 16 *Asst Prof of Pharmacology* (2, 1944)
- Raulston, B O, M D** 200 S Hudson Ave, Los Angeles, Calif *Prof of Medicine and Dir of Clin Teaching and Assoc Dean, Univ of Southern California School of Medicine* (3, 1942)
- Ravdin, I S, M D** Univ of Pennsylvania School of Medicine, Philadelphia *John Rhea Barton Prof of Surgery, Chief Surgeon, Hospital of the Univ of Pennsylvania* (1, 1930, 4, 1930)
- Rawson, Rulon W, M D** Memorial Hospital, New York City *Attending Physician, Chief, Dept of Clin Investigation, Sloan-Kettering Inst* (1, 1947)
- Raymond, Albert L, Ph D** G D Searle and Co, P O Box 5110, Chicago 80, Ill *Vice Pres in charge of Research and Development* (2, 1932)
- Rebuck, John W, M D, Ph D** Henry Ford Hospital, Dept of Labs, Detroit 2, Mich *Assoc in Pathology* (4, 1950)
- Redfield, Alfred C, Ph D** Woods Hole, Mass *Prof of Physiology, Harvard Univ* (1, 1919)
- Reed, Carlos I, Ph D** Univ of Illinois College of Medicine, 1853 W Polk St, Chicago *Prof of Physiology* (1, 1923)
- Reed, Emerson A, Ph D** Hahnemann Med College, Philadelphia, Pa *Asst Prof of Physiology* (1, 1948)
- Reese, John D, M D** North Carolina Sanatorium for the Treatment of Tuberculosis, McCann *Pathologist and Lab Dir* (4, 1949)
- Rehm, Warren S, Jr, Ph D, M D** Univ of Louisville School of Medicine, Louisville, Ky *Prof of Physiology* (1, 1945)
- Reid, Marion Adelaide, Ph D** New Jersey College for Women, New Brunswick *Asst Prof, Dept of Zoology* (1, 1941)
- Reid, Mary E, Ph D** Natl Insts of Health, Bethesda 14, Md *Cytologist* (5, 1947)
- Reumann, Hobart A, M D** Jefferson Hospital, Philadelphia, Pa *Prof of Medicine, Jefferson Med College* (4, 1933)
- Reimann, Stanley P, M D, Sc D** 703 W Phil-

- Ellena St , Mount Airy, Philadelphia, Pa *Dir of Research Inst of Lankenau Hospital, Prof of Oncology, Hahnemann Med College and Hospital, Philadelphia* (1, 1921, 4, 1924)
- Reinecke, Roger M , Ph D , M D Univ of Puerto Rico, School of Medicine, School of Tropical Medicine, San Juan (1, 1947)
- Reineke, E P , Ph D Michigan State College, Dept of Physiology and Pharmacology, East Lansing *Professor* (1, 1950)
- Reiner, John M , Ph D Tufts College Med School, Dept of Physiology, Boston, Mass (1, 1947)
- Reiner, Laszlo, M D , Ph D Wallace and Tiernan Products, Inc , 11 Mill St , Belleville 9, N J *Dir , Pharmaceutical Research* (2, 1942, 6, 1933)
- Reinhardt, William O , M D Univ of California, Berkeley 4 *Assoc Prof of Anatomy* (1, 1950)
- Reinhold, John G , Ph D Univ of Pennsylvania Hospital, 702 Maloney Bldg , Philadelphia 4, Pa *Asst Prof of Physiological Chemistry and Medicine* (2, 1936)
- Rekers, Paul E , M D Inst for Med Research, Cedars of Lebanon Hospital, 4751 Fountain Ave , Los Angeles 27, Calif *Research Assoc* (4, 1950)
- Remington, John W , Ph D Med College of Georgia, Augusta *Asst Prof of Physiology* (1, 1943)
- Remington, Roe E , Ph D , P O Box 1252, Hendersonville, N C *Consultant* (2, 1930, 5R, 1934)
- Renfrew, Alice G , Ph D Mellon Inst of Industrial Research, Univ of Pittsburgh, Pittsburgh, Pa *Sr Fellow* (2, 1939)
- Reynolds, Chapman, M D Louisiana State Univ School of Medicine, New Orleans *Asst Prof of Pharmacology* (3, 1937)
- Reynolds, Orr E , Ph D Office of Naval Research, Med Sciences Div , Washington, D C *Head of Physiology Branch* (1, 1948)
- Reynolds, Samuel R M , Ph D , Sc D 4028 Deepwood Rd , Baltimore 18, Md *Staff Member and Physiologist, Carnegie Inst of Washington, Dept of Embryology* (1, 1932)
- Reznikoff, Paul, M D New York Hospital, 525 E 68th St , New York City *Prof of Clin Medicine, Cornell Univ Med College* (1, 1927)
- Rhines, Ruth, Ph D , M D Univ of Pennsylvania School of Medicine, Dept of Anatomy, Philadelphia 4 *Asst Prof of Anatomy, Instr in Medicine* (1, 1950)
- Rhoads, Cornelius Packard, M D Memorial Hospital, 441 E 68th St , New York City *Dir , Prof of Pathology, Cornell Univ Med College* (4, 1930)
- Rhoads, Jonathan Evans, M D , D Sc Univ of Pennsylvania School of Medicine, Philadelphia 4 *Prof of Surgery, Chief, Surgical Div II, Hospital of the Univ of Pennsylvania* (1, 1946)
- Rice, Christine E , Ph D Animal Diseases Research Inst , Canadian Dept of Agriculture, Hull, Quebec, Canada *Agricultural Scientist* (6, 1938)
- Rice, Harold V , Ph D Univ of Alberta, Edmonton, Alberta, Canada *Prof of Physiology* (1, 1948)
- Rice, James C , Ph D Univ of Mississippi, P O Box 475, University *Prof of Pharmacology* (3, 1941)
- Rich, Arnold Rice, M D Johns Hopkins Hospital, Baltimore, Md *Bazley Prof of Pathology, Johns Hopkins Univ* (4, 1924)
- Richards, Alfred N , Ph D , M D 737 Rugby Rd , Bryn Mawr, Pa *Prof Emeritus of Pharmacology, Univ of Pennsylvania* (1R, 1900, 2, 1906, 3R, 1909)
- Richards, Oscar W , Ph D American Optical Co , Research Lab , P O Box 137, Stamford, Conn *Chief Biologist* (1, 1934)
- Richards, Richard Kohn, M D Abbott Labs , North Chicago, Ill *Assoc Dir of Pharmacologic Research, Prof Lecturer in Pharmacology, Northwestern Univ Med School* (1, 1938, 3, 1947)
- Richardson, Arthur P , M D Emory Univ School of Medicine, Emory University, Ga *Prof and Chairman of Dept of Pharmacology* (3, 1939)
- Richardson, Luther R , Ph D P O Box 102, College Station, Tex *Prof of Biochemistry and Nutrition, Texas A & M College* (5, 1942)
- Richter, Curt P , Ph D Phipps Psychiatric Clinic, Johns Hopkins Hospital, Baltimore, Md *Assoc Prof of Psycho-biology, Johns Hopkins Univ* (1, 1924)
- Richter, Maurice N , M D 303 E 20th St , New York City *Prof of Pathology, Bellevue Med Center, Dir Dept of Pathology, Univ Hospital* (4, 1931)
- Ricketts, Henry T , M D Univ of Chicago, Dept of Medicine, Chicago, Ill *Assoc Prof of Medicine* (1, 1940)
- Riddle, Oscar, Ph D Route 4, Plant City, Fla (1R, 1919)
- Riegel, Byron, Ph D Northwestern Univ , Dept of Chemistry , Evanston, Ill *Professor* (2, 1942)
- Riegel, Cecilia, Ph D Univ of Pennsylvania Hospital, Philadelphia 4, Pa *Asst Prof , Harrison Dept of Surgical Research Univ of Pennsylvania School of Medicine* (2, 1938)
- Rigdon, R H , M D Univ of Texas Med Branch, Galveston *Prof of Exper Pathology* (4, 1941)
- Riggs, Douglas S , M D Harvard Med School, Boston, Mass *Assoc in Pharmacology* (3, 1948)
- Riggs, Lloyd K , Ph D Natl Dairy Research Labs , Oakdale, L I , N Y *Dir of Nutritional Research* (2, 1929)

- Riker, Walter F, Jr, M D Cornell Univ Med College, 1300 York Ave, New York City 21 *Assoc Prof of Pharmacology* (3, 1947)
- Riley, Richard F, Ph D P O box 31, Beverly Hills, Calif *Asst Clin Prof of Radiology* (3, 1950)
- Riley, Richard L, M D 1901 Dixon Rd, Baltimore 9, Md *Dept of Environmental Medicine, Johns Hopkins Univ* (1, 1948)
- Rinehart, James F, M D Univ of California Med School, Parnassus and Third Aves, San Francisco *Prof of Pathology* (4, 1933)
- Ring, Gordon C, Ph D Temple Univ Med School, Broad St, Philadelphia, Pa (1, 1933)
- Rioch, David McKenzie, M D Chestnut Lodge Sanitarium, 500 W Montgomery Ave, Rockville, Md *Dir of Research* (1, 1931)
- Rittenberg, David, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc Prof* (2, 1939)
- Ritzman, E G, A M Univ of New Hampshire, Durham *Research Prof* (5R, 1933)
- Rivers, T M, M D, Sc D Hospital of Rockefeller Inst for Med Research, 66th St and York Ave, New York City *Director* (4, 1925, 6, 1921)
- Robb, Jane Sands, Sc D, M D Syracuse Univ College of Medicine, 761 Irving Ave, Syracuse, N Y *Assoc Prof of Pharmacology* (1, 1924)
- Robbins, Benjamin Howard, M S, M D Vanderbilt Univ School of Medicine, Nashville, Tenn *Assoc Prof of Pharmacology, Prof of Anesthesiology* (3, 1936)
- Robbins, Kenneth C, Ph D Inst of Pathology, 2085 Adelbert Rd, Cleveland, Ohio *Asst Prof of Immunochemistry* (6, 1950)
- Robbins, Mary L, Ph D George Washington Univ School of Medicine, 1335 H St, N W, Washington 5, D C *Asst Prof of Bacteriology* (6, 1946)
- Roberts, Edward F, M D, Ph D Wyeth, Inc, 1600 Arch St, Philadelphia 3, Pa *Dir of Clin Investigation* (6, 1932)
- Roberts, Eugene, Ph D Washington Univ Med School, 4580 Scott Ave, St Louis 10, Mo *Research Assoc in Cancer* (2, 1950)
- Roberts, Joseph T, M D, Ph D Veterans Admin Hospital, Batavia, N Y *Chief of Med Service* (1, 1947)
- Roberts, Lydia J, Ph D Univ of Puerto Rico, Rio Piedras, P R *Prof and Chairman of Dept of Home Economics* (5, 1933)
- Roberts, Sidney, Ph D Univ of California Med School, Los Angeles *Asst Prof of Physiological Chemistry* (1, 1946, 2, 1950)
- Robertson, Elizabeth Chant, M D, Ph D Univ of Toronto, Toronto, Ontario, Canada *Research Fellow in Pediatrics* (5, 1939)
- Robertson, Oswald H, M D Stanford Univ, Dept of Biology, Palo Alto, Calif *Prof of Medicine* (4R, 1932)
- Robinson, Charles Summers, Ph D Vanderbilt Univ Med School, Nashville, Tenn *Prof of Biochemistry* (2, 1925)
- Robinson, Elliott S, M D, Ph D R F D 4, Lacomia, N H (6, 1935)
- Robinson, G Canby, M D, 4712 Keswick Rd, Baltimore, Md *Exec Sec, Maryland Tuberculosis Assoc* (1R, 1912)
- Robinson, Harry J, Ph D, M D Merck Inst for Therapeutic Research, Rahway, N J *Asst Dir* (3, 1946)
- Robinson, Herbert E, Ph D Swift and Co, Research Labs, Union Stock Yards, Chicago 9, Ill *Asst Dir of Research* (5, 1947)
- Robinson, Howard W, Ph D Broad and Ontario Sts, Philadelphia, Pa *Prof of Physiological Chemistry, Temple Univ School of Medicine* (2, 1929)
- Robinson, Sid, Ph D Indiana Univ Med School, Bloomington *Prof of Physiology* (1, 1941)
- Robinson, True W, Ph D Med College of Alabama, Birmingham 5 (1, 1948)
- Roblin, Richard O, Jr, Ph D 1937 W Main St, Stamford, Conn *Dir of Chemotherapy Div, American Cyanamid Co* (2, 1946)
- Robschert-Robbins, F S, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Assoc in Pathology* (1, 1925, 4, 1930)
- Rodbard, Simon, Ph D Michael Reese Hospital, Cardiovascular Dept, 29th and Ellis Aves, Chicago, Ill (1, 1942)
- Roe, Joseph Hiram, Ph D George Washington Univ School of Medicine, Washington, D C *Prof of Biochemistry* (2, 1927, 5, 1933)
- Roeder, Kenneth D, M A Tufts College, Medford, Mass *Assoc Prof of Biology* (1, 1942)
- Roepke, Martin Henry, Ph D Univ Farm, St Paul, Minn *Prof of Veterinary Medicine* (3, 1937)
- Rogers, Charles G, Ph D Oberlin College, Oberlin, Ohio *Prof of Comparative Physiology* (1R, 1911)
- Rogers, Fred T, Ph D, M D Dallas Med and Surgical Clinic, 4105 Live Oak St, Dallas 1, Tex (1, 1917)
- Rogoff, Julius M, M D, Sc D Belle Island, Roanoke, Conn (1, 1916, 3, 1916)
- Roine, Paavo K, Ph D Univ of Helsinki, Helsinki, Finland *Prof of Nutritional Chemistry* (5, 1950)
- Rolfe, Daniel Thomas, M D Meharry Med College, Nashville 8, Tenn *Chairman, Dept of Physiology and Pharmacology, Prof of Physiology* (1, 1950)
- Roll, Paul M, Ph D Sloan-Kettering Inst for Cancer Research, 444 E 68th St, New York City 21 *Assoc Member* (2, 1950)

- Ronzoni, Ethel**, Ph D Washington Univ Med School, 640 S Kingshighway, St Louis 10, Mo *Asst Prof of Biological Chemistry, Neuropsychiatry Dept* (2, 1923)
- Roos, Albert**, M D Washington Univ School of Medicine, Dept of Physiology, Euclid Ave and Kingshighway, St Louis 10, Mo *Instr in Physiology and Surgery* (1, 1949)
- Root, Howard F**, M D 44 Dwight St, Brookline, Mass *Assoc in Medicine, Harvard Med School* (5, 1933)
- Root, Raymond W**, Ph D College of the City of New York, 139th St and Convent Ave, New York City *Assoc Prof of Biology, Head of Div of Physiology* (1, 1949)
- Root, Walter S**, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Prof of Physiology* (1, 1932)
- Rosahn, Paul D**, M D 92 Grand St, New Britain, Conn *Pathologist, New Britain General Hospital, Assoc Clin Prof of Pathology, Yale Univ School of Medicine* (4, 1934)
- Rose, Harry M**, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc Prof of Bacteriology* (6, 1949)
- Rose, Jerzy E**, M D Johns Hopkins Univ Med School, Dept of Physiology, 710 N Washington St, Baltimore 5, Md *Asst Prof of Physiology and Psychiatry* (1, 1949)
- Rose, William C**, Ph.D Univ of Illinois, Urbana *Prof of Biochemistry* (2, 1912, 5, 1933)
- Rosenblueth, Arturo**, M D Instituto Nacional de Cardiologia, Calzada de la Piedad 300, Mexico D F, Mexico (1, 1932)
- Rosenfeld, Morris**, M D Johns Hopkins School of Medicine, Baltimore, Md *Assoc Prof of Pharmacology and Exper Therapeutics* (3, 1934)
- Rosenow, Edward C**, M D Longview State Hospital, Research Dept, Cincinnati 16, Ohio (4, 1913, 6, 1915)
- Rosenthal, Otto**, M D Univ of Pennsylvania School of Medicine, Philadelphia, Pa *Asst Prof of Cancer Research, Harrison Dept of Surgical Research* (2, 1946)
- Rosenthal, Sanford M**, M D Natl Insts of Health, Bethesda, Md *Chief, Section in Pharmacology and Toxicology, Exper Biology Inst* (3, 1925)
- Rosenthal, S R**, M D, Ph D Univ of Illinois College of Medicine, Chicago *Assoc Prof of Preventive Medicine and Public Health, Dir, Institution for Tuberculosis Research of Univ of Illinois* (1, 1948, 4, 1941)
- Ross, Joseph F**, M D Robert Dawson Evans Memorial, 65 E Newton St, Boston, Mass *Physician, Massachusetts Memorial Hospital, Assoc Prof of Medicine, Boston Univ School of Medicine* (4, 1941)
- Rossiter, R J**, Ph D Univ of Western Ontario, London, Ontario, Canada *Prof of Biochemistry* (2, 1948)
- Rostorfer, Howard Hayes**, Ph D Indiana Univ, Bloomington *Asst Prof of Physiology* (1, 1946)
- Roth, George B**, M D 3814 T St N W, Washington D C *Prof Emeritus of Pharmacology, George Washington Univ* (1R, 1914, 3R, 1911)
- Roth, Grace M**, Ph D Mayo Clinic, Rochester, Minn *Assoc in Clin Physiology* (1, 1939)
- Roth, James Luther d'Aumont**, M D, Ph D Univ of Pennsylvania Grad Hospital, 19th and Lombard Sts, Philadelphia 46 *Research Fellow in Gastroenterology, Grad School of Medicine, Univ of Pennsylvania* (1, 1950)
- Roth, L W**, Ph D Abbott Research Labs, Dept of Pharmacology, North Chicago, Ill *Sr Research Pharmacologist* (1, 1947, 3, 1950)
- Rothchild, Irving**, Ph D Ohio State Univ, Dept of Obstetrics and Gynecology, Univ Hospital, Columbus, Ohio (1, 1949)
- Rothmund, Paul W K**, Dr -Ing Antioch College, Yellow Springs, Ohio *Prof of Chemistry, Research Chemist, C F Kettering Foundation* (2, 1940)
- Rothstein, A**, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester 7, N Y *Asst Prof in Pharmacology, Chief of Physiological Section, Pharmacological Div, Atomic Energy Project* (1, 1949)
- Rous, Peyton**, M D, Sc D Rockefeller Inst for Med Research, York Ave at 66th St, New York City *Member Emeritus* (4, 1913)
- Routh, Joseph I**, Ph D State Univ of Iowa, Iowa City *Assoc Prof of Biochemistry* (2, 1942)
- Rovenstine, Emery Andrew**, M D 477 First Ave, New York City *Prof and Chairman, Dept of Anesthesiology, New York Univ -Bellevue Med Center* (3, 1944)
- Rowntree, Jennie I**, Ph D Univ of Washington, Seattle *Prof of Home Economics* (5, 1933)
- Rowntree, L G**, M D, Sc D 5149 Alton Rd, Miami Beach, Fla (1R, 1911, 2, 1910, 3R, 1908, 4, prior to 1920)
- Rubenstein, Boris B**, Ph D, M D 5121 Ellis Ave, Chicago 15, Ill (1, 1934)
- Rubin, Saul H**, Ph D Hoffmann-LaRoche, Inc, Nutley 10, N J *Dir of Nutrition Labs* (2, 1947, 5, 1947)
- Ruch, Theodore C**, Ph D Univ of Washington, G405 Health Sciences Bldg, Seattle 5 *Prof of Physiology and Biophysics* (1, 1933)
- Ruchman, Isaac**, Ph D Cincinnati General Hospital, Cincinnati, Ohio *Asst Prof of Bacteriology* (6, 1948)
- Rugh, Roberts**, Ph D Columbia Univ, College of Physicians and Surgeons, Dept of Radiology, New York City 32 *Assoc Prof of Radiology* (1, 1950)

- Rusch, Harold Paul, M D Univ of Wisconsin Med School, McArdle Memorial Lab, Madison 6 *Prof of Oncology, Dir of Lab* (4, 1940)
- Rushmer, Robert F, M D Univ of Washington School of Medicine, Dept of Physiology and Biophysics, Seattle 5 *Asst Prof* (1, 1949)
- Rusoff, Louis L, Ph D Louisiana State Univ, Baton Rouge *Assoc Dairy Nutritionist in Exper Station and Assoc Prof of Nutrition* (5, 1948)
- Russell, Jane A, Ph D Emory Univ School of Medicine, Dept of Biochemistry, Emory Univ, Ga (1, 1939)
- Russell, Walter C, Ph D New Jersey Agricultural Exper Station, Rutgers Univ, New Brunswick *Research Specialist and Prof of Agricultural Biochemistry* (2, 1932, 5, 1933)
- Ryan, Andrew Howard, M D Chicago Med School, 710 S Wolcott Ave, Chicago, Ill *Assoc Prof of Physiology and Pharmacology* (1, 1912)
- Rytand, David A, M D Stanford Univ Hospital, San Francisco 15, Calif *Assoc Prof of Medicine, Stanford Univ School of Medicine* (3, 1946)
- Sabin, Albert, M D Children's Hospital Research Foundation, Cincinnati, Ohio *Prof of Research Pediatrics, Univ of Cincinnati* (6, 1946)
- Sabin, Florence R, M D, Sc D 1333 E 10th Ave, Denver 3, Colo *Member Emeritus, Rockefeller Inst* (1R, 1923)
- Sacks, Ernest, M D 28 Malborough Rd, North Haven, Conn *Prof Emeritus of Clin Neurological Surgery, Washington Univ Med School* (1R, 1910)
- Sacks, Jacob, Ph D, M D Brookhaven Natl Lab, Biology Dept, Upton, L I, N Y *Physiologist* (1, 1948, 3, 1933)
- Sah, Peter P T, Ph D Univ of Calif, Div of Pharmacology and Exper Therapeutics, San Francisco *Lecturer in Pharmacology* (3, 1941)
- Sahyun, Melville, Ph D Sahyun Research Lab, 316 Castillo St, Santa Barbara, Calif *Dir and Owner* (2, 1932)
- Sakami, Warwick, Ph D Western Reserve Univ School of Medicine, 2109 Adelbert Rd, Cleveland 6, Ohio *Asst Prof of Biochemistry* (2, 1949)
- Salk, Jonas E, M D Univ of Pittsburgh School of Medicine, Pittsburgh, Pa *Assoc Research Prof of Bacteriology* (6, 1947)
- Salmon, W D, A M Alabama Polytechnic Inst, Auburn *Head, Animal Husbandry and Nutrition* (2, 1929, 5, 1933)
- Salter, William T, M D Yale Univ School of Medicine, 333 Cedar St, New Haven, Conn *Prof of Pharmacology* (1, 1933, 3, 1942, 5, 1934)
- Sammis, Florence E, M D 133 E 58th St, New York City *Physician, Allergy, OPD, New York Hospital* (6, 1943)
- Sampson, John J, M D 2211 Post St, San Francisco, Calif (1, 1932)
- Sampson, Myra M, Ph D Smith College, Northampton, Mass *Prof of Zoology* (5, 1935)
- Samuels, Leo T, Ph D Univ of Utah Med School, Salt Lake City *Prof and Head of Dept of Biological Chemistry* (2, 1941, 3, 1937, 5, 1949)
- Sandels, Margaret R, Ph D Florida State Univ, Tallahassee *Dean of School of Home Economics, Prof of Nutrition* (5, 1933)
- Sandiford, Irene, Ph D Billings Hospital, Univ of Chicago, Chicago, Ill *Asst Prof of Medicine* (2, 1925, 5, 1933)
- Sandow, Alexander, Ph D Washington Square College of Arts and Sciences, New York Univ, New York City *Assoc Prof of Biology* (1, 1945)
- Sandweiss, David J, M D 9739 Dexter Ave, Detroit, Mich *Instr in Clin Medicine, Wayne Univ College of Medicine, Physician, Harper Hospital (OPD)* (1, 1944)
- Sanford, Arthur H, M A, M D Clin Labs, Mayo Clinic, Rochester, Minn *Head of Div of Clin Labs* (6R, 1920)
- Santos, Francisco O, Ph D Univ of the Philippines, Los Banos, Laguna *Prof and Head of Dept of Agricultural Chemistry, College of Agriculture* (5, 1936)
- Saphir, Otto, M D Michael Reese Hospital, 29th St and Ellis Ave, Chicago 16, Ill *Pathologist, Clin Prof of Pathology, Univ of Illinois Med School* (4, 1927)
- Saphra, Ivan, M D Beth Israel Hospital, New York City *Assoc Bacteriologist* (6, 1946)
- Sapirstein, Leo Abraham, Ph D, M D Univ of Southern California, Univ Park, Los Angeles 7 *Asst Prof of Physiology, S A Surgeon (R) USPHS* (1, 1950)
- Sappington, Samuel W, M D, D Sc P O Box 528, Bryn Mawr, Pa *Prof of Pathology, Hahnemann Hospital* (6R, 1913)
- Sarett, Herbert P, Ph D Tulane Med School, 1430 Tulane Ave, New Orleans 13, La *Asst Prof of Biochemistry* (2, 1946, 5, 1947)
- Sarnoff, Stanley J, M D Harvard School of Public Health, 55 Shattuck St, Boston 15, Mass *Asst Prof of Physiology* (1, 1949)
- Sartorius, Otto W, M D Syracuse Univ, College of Medicine, Irving Ave, Syracuse, N Y *Asst Prof of Physiology* (1, 1950)
- Saslaw, Samuel, Ph D, M D Ohio State Univ, Columbus 10 *Asst Prof in Medicine and Bacteriology* (6, 1950)
- Saslow, George, Ph D, M D Washington Univ Med School, Dept of Neuropsychiatry, 640 S Kingshighway, St Louis, Mo *Asst Prof of Psychiatry, Assoc Physician to the Student Health Service* (1, 1936)
- Satterfield, G Howard, A M Univ of North

- Carolina, State College of Agriculture and Engineering, Raleigh *Prof of Biochemistry* (2, 1944, 5, 1941)
- Saul, Leon Joseph, M A , M D Room 1907, 255 S 17th St , Philadelphia 3, Pa (1, 1933)
- Sawyer, Charles H , Ph D Duke Univ School of Medicine, Durham, N C *Prof of Anatomy* (1, 1949)
- Sawyer, Margaret E MacKay, Ph D 142 Lower Albert St , Kingston, Ontario, Canada *Royal Military College* (1, 1935)
- Sawyer, Wilbur A , M D 770 Hilldale Ave , Berkeley 8, Calif (4, 1930)
- Saxton, John A , Jr , M D Snodgrass Lab of Pathology and Bacteriology, 1430 Carroll St , St Louis, Mo *Asst Prof of Pathology, Washington Univ School of Medicine, Lab Dir , Hospital Div , City of St Louis* (4, 1944)
- Sayers, George, Ph D Univ of Utah, Salt Lake City 1 *Assoc Prof of Pharmacology* (1, 1948, 3, 1947)
- Scamman, Richard E , Ph D 172 S E Bedford St , Minneapolis, Minn *Distinguished Service Prof in Grad School* (1R, 1923)
- Scantlebury, Ronald E , Ph D Natl Insts of Health, Div of Research Grants and Fellowships, Bethesda 14, Md (1, 1948)
- Schaefer, Arnold E , Ph D Alabama Polytechnic Inst Lab of Animal Nutrition, Auburn *Assoc Animal Nutritionist* (5, 1950)
- Schales, Otto, D Sc Ochsner Clinic, Prytania and Aline Sts , New Orleans, La *Dir of Chemical Research, Ochsner Foundation, Dir , Biochemical Lab , Ochsner Clinic, Assoc Prof of Biochemistry, Tulane Univ School of Medicine* (2, 1944)
- Scharles, Frederick H , M D 603 El Morado Ct , Ontario, Calif (5, 1935)
- Schattenberg, Herbert John, M S , M D Lab of Clin Pathology, 220-222 Med Arts Bldg , San Antonio, Tex *Director* (4, 1940)
- Schenken, John R , M D Univ of Nebraska College of Medicine, Omaha *Prof of Pathology and Bacteriology* (4, 1942)
- Scherago, Morris, D V M Univ of Kentucky, Lexington *Prof and Head of Dept of Bacteriology* (6, 1948)
- Scherp, Henry W , Ph D Univ of Rochester School of Medicine and Dentistry, Rochester 7, N Y *Assoc Prof of Bacteriology and Immunology* (6, 1940)
- Schick, Bela, M D 17 E 84th St , New York City *Pediatrician, Mt Sinai and Sea View Hospitals* (6, 1924)
- Schiffman, Milton J , Ph D Hoffmann-LaRoche, Inc , Chicago, Ill *Research Consultant* (1, 1943)
- Schiller, Alfred A , M D Univ of Illinois College of Medicine, Chicago *Asst Prof of Physiology* (1, 1948)
- Schiller, Joseph, M D , Ph D 55 West 11th St , New York City 11 *Assoc Prof of Physiology, Long Island Univ* (1, 1949)
- Schlenk, Fritz, Ph D Science Hall, Iowa State College, Ames *Prof of Bacteriology* (2, 1942)
- Schlesinger, M J , Ph D , M D Beth Israel Hospital, 330 Brookline Ave , Boston, Mass *Dir of Pathology, Asst Prof of Pathology, Harvard Med School* (4, 1942, 6, 1921)
- Schlomovitz, Benjamin H , M D 1210 Majestic Bldg , 231 W Wisconsin Ave , Milwaukee, Wis (1, 1919)
- Schlumberger, Hans G , M D Ohio State Univ School of Medicine, Columbus *Assoc Prof in Pathology* (4, 1945)
- Schmeisser, Harry C , M D Univ of Tennessee, Memphis *Prof of Pathology* (4, 1937)
- Schmidt, Carl F , M D Univ of Pennsylvania Med School, Philadelphia *Prof of Pharmacology* (1, 1929, 3, 1924)
- Schmidt, C Robert, Ph D , M D 1027 S Tejon, Colorado Springs, Colo (1, 1940)
- Schmidt, Gerhard, M D Boston Dispensary, 25 Bennett St , Boston, Mass *Sr Research Fellow, Tufts College Med School* (2, 1939)
- Schmidt, L H , Ph D Christ Hospital Inst of Med Research, 2139 Auburn Ave , Cincinnati 19, Ohio *Dir of Research, Assoc Research Prof of Biochemistry, Univ of Cincinnati College of Medicine* (2, 1936, 3, 1946)
- Schmidt-Nielsen, Bodil, D D S Kettering Lab , Univ of Cincinnati, Cincinnati, Ohio *Research Assoc* (1, 1949)
- Schmidt-Nielsen, Knut, Ph D Kettering Lab , Univ of Cincinnati, Cincinnati, Ohio *Asst Prof* (1, 1949)
- Schmitt, Francis Otto, Ph D Massachusetts Inst of Technology, Cambridge *Prof of Biology* (1, 1930)
- Schmitt, Otto H , Ph D Univ of Minnesota, Dept of Physics, Minneapolis 14 *Assoc Prof of Zoology and Physics* (1, 1947)
- Schneider, Charles L , M D , Ph D Wayne Univ College of Medicine, Dept of Physiology, Detroit 26, Mich (1, 1949)
- Schneider, Edward C , Ph D 25 Gordon Place, Middletown, Conn *Prof Emeritus of Biology, Wesleyan Univ* (1R, 1912, 2, 1912)
- Schneider, Howard A , Ph D Rockefeller Inst for Med Research, 66th Street and York Avenue, New York City 21 *Associate* (5, 1947)
- Schneider, John J , Ph D , M D Jefferson Med College, 1025 Walnut St , Philadelphia 7, Pa *Research Assoc , Expr Medicine* (2, 1950)
- Schneerson, S Stanley, M D Mount Sinai Hospital, 2 East 100th St , New York City 29 *Assoc Bacteriologist* (6, 1946)
- Schoenbach, Emanuel B , M D Johns Hopkins School of Hygiene, 615 N Wolfe St , Baltimore,

- Md Assoc Prof of Preventive Medicine (6, 1941)
- Schoepfle, Gordon M, Ph D Washington Univ School of Medicine, St Louis, Mo Asst Prof of Physiology (1, 1943)
- Scholander, P F, M D, Ph D Swarthmore College, Dept of Zoology, Swarthmore, Pa Research Biologist (1, 1947)
- Schradeck, Constant E, M D P O Box 98, Newton Highlands, Mass Retired (6, 1921)
- Schreiner, Oswald, Ph D 21 Primrose St, Chevy Chase 15, Md Collaborator, U S D A (2, 1908)
- Schroeder, E F, Ph D G D Searle & Co, P O Box 5110, Chicago 80, Ill Research Biochemist (2, 1938)
- Schroeder, Henry A, M D Dept of Internal Medicine, Hypertension Div, Washington Univ, 640 S Kingshighway, St Louis 10, Mo (1, 1947)
- Schubert, Maxwell, Ph.D New York Univ College of Medicine, 477 First Ave, New York City 10 Adjunct Assoc Prof of Chemistry (3, 1947)
- Schuck, Cecelia, Ph D Purdue Univ, Dept of Home Economics, Lafayette, Ind Prof of Nutrition (5, 1941)
- Schueler, Fred W, Ph D State Univ of Iowa College of Medicine, Dept of Pharmacology, Iowa City Asst Prof (3, 1949)
- Schultz, Edwin William, M D Stanford Univ, 743 Cooksey Lane, Stanford, Calif Prof of Bacteriology and Exper Pathology (4, 1927, 6, 1928)
- Schultz, Fred H, Jr, Ph D Commercial Solvents Corp, Terre Haute, Ind Dir, Pharmaceutical Research (3, 1948)
- Schultz, W H, Ph D 241 W Broadway, Long Beach, N Y Prof Emeritus of Pharmacology, Univ of Maryland (1R, 1907, 3R, 1909)
- Schultze, Max O, Ph D Univ of Minnesota, Div of Agricultural Biochemistry, St Paul 8 Professor (2, 1938)
- Schweigert, B S, Ph D Univ of Chicago, American Meat Inst Foundation, 939 E 57th St, Chicago 37, Ill Asst Prof of Biochemistry, Head, Div of Biochemistry and Nutrition, American Meat Inst Foundation (2, 1949, 5, 1950)
- Schweizer, Malvina, Ph D New York Univ, Washington Square College of Arts and Sciences, New York City Asst Prof of Biology (1, 1944)
- Schwerma, Henry, Ph D 107 Upper Terr, San Francisco 17, Calif (1, 1948)
- Schwert, George W, Ph D Duke Univ School of Medicine, Dept of Biochemistry, Durham, N C Asst Prof (2, 1949)
- Schwimmer, Sigmund, Ph D Enzyme Research Lab, 800 Buchanan St, Albany 6, Calif Chemist, U S Bureau of Agricultural and Industrial Chemistry (2, 1947)
- Scott, Charles Covert, Ph D, M D Inlow Clinic, Shelbyville, Ind Internist (3, 1945)
- Scott, David Alymer, Ph D Connaught Labs, Univ of Toronto, Toronto 5, Ontario, Canada Research Member (2, 1935)
- Scott, Donald, Jr, Ph.D Univ of Pennsylvania Med School, 243 Anatomy Bldg, Philadelphia 4 Asst Prof, Dept of Anatomy, Assoc, Dept of Neurology (1, 1950)
- Scott, Ernest L, Ph D 64 South St, Bogota, N J Assoc Prof Emeritus of Physiology, Columbia Univ (1R, 1914, 2, 1915)
- Scott, Frederick Hughes, Ph D, M B Univ of Minnesota, Minneapolis Prof Emeritus of Physiology (1R, 1908, 2, 1909)
- Scott, James K, M D Univ of Rochester School of Medicine and Dentistry, Atomic Energy Project, Rochester 7, N Y Chief, Pathology Section, AEC, Assoc in Pathology (4, 1949)
- Scott, John C, Ph D Hahnemann Med College, Philadelphia, Pa Prof and Head of Dept of Physiology (1, 1936)
- Scott, R W, M A, M D City Hospital, Cleveland, Ohio Physician in Chief, Prof of Clin Medicine, Western Reserve Univ (1, 1917, 3, 1917)
- Scott, V Brown, Ph D, M D Inlow Clinic, Shelbyville, Ind Internist, Div of Medicine (1, 1941)
- Scott, W W, Ph D, M D Brady Urological Inst, Johns Hopkins Hospital, Baltimore 5, Md (1, 1943)
- Scrimshaw, Nevin S, Ph D, M D Instituto de Nutricion de Centro America y Panama, Guatemala City, Guatemala, Central America Dir of Div of Nutrition, Pan American Sanitary Bureau (5, 1949)
- Scudi, John V, Ph D Nepera Chemical Co, Inc, Nepera Park, Yonkers 2, N Y Dir of Research (2, 1942, 3, 1950, 5, 1945)
- Seager, Lloyd D, M S, M D Univ of Arkansas Med. School, Little Rock Prof and Head, Dept of Physiology and Pharmacology (3, 1939)
- Sealock, Robert R, Ph D Iowa State College, Ames Assoc Prof of Chemistry (2, 1940, 5, 1941)
- Seastone, C V, Jr, M D Univ of Wisconsin Med School, Madison Prof and Chairman of Med Bacteriology (6, 1939)
- Sebrell, W H, Jr, M D Natl Insts of Health, Bethesda 14, Md Dir, Natl Insts of Health, Professorial Lecturer on Nutrition, George Washington Univ (2, 1938, 5, 1937)
- Seecof, David P, M D 1970 Daly Ave, Bronx, New York City (4, 1927)
- Seegal, Beatrice Carrie, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 Assoc Prof of Bacteriology (6, 1949)

- Seegal, David**, M D Maimonides Hospital, Brooklyn, N Y *Dir of Med Services* (6, 1930)
- Seegers, Walter H**, Ph D Wayne Univ College of Medicine, 1512 St Antoine St, Detroit 26, Mich *Prof of Physiology* (1, 1947, 2, 1941)
- Seever, Maurice Harrison**, Ph D, M.D Univ of Michigan, Ann Arbor *Prof of Pharmacology* (1, 1933, 3, 1930)
- Segaloff, Albert**, M D Alton Ochsner Med Foundation, 3503 Prytania St New Orleans, La *Dir of Endocrine Research* (4, 1946)
- Seibert, Florence B**, Ph D Univ of Pennsylvania, Henry Phipps Inst, 7th and Lombard Sts, Philadelphia *Assoc Prof of Biochemistry* (2, 1925)
- Seidell, Atherton**, Ph D 2301 Connecticut Ave, Washington, D C *Special Expert, Natl Insts of Health* (2, 1924)
- Seifter, Joseph**, M D Wyeth Inst of Applied Biochemistry, Philadelphia, Pa *Director* (3, 1940)
- Seifter, Sam**, Ph D New York State Univ Med Center at New York City, 350 Henry St, Brooklyn 2, N Y *Assoc Prof of Biochemistry* (2, 1946)
- Selkurt, Ewald E**, Ph D Western Reserve Univ School of Medicine, Cleveland 6, Ohio *Assoc Prof of Physiology* (1, 1945)
- Selle, Wilber Arthur**, Ph D Univ of California at Los Angeles Med School, Los Angeles *Prof and Head, Dept of Biophysics* (1, 1938)
- Sellers, E A**, M D, Ph D Univ of Toronto, Dept of Physiology, Toronto, Ontario, Canada *Assoc Prof of Physiology, Assoc Prof in Banting and Best Dept of Med Research* (1, 1947)
- Selye, Hans**, M D, Ph D Inst of Exper Medicine and Surgery, Univ of Montreal, Montreal, Quebec, Canada *Prof and Dir* (1, 1934)
- Sendroy, Julius, Jr**, Ph D Naval Med Research Inst, Natl Naval Med Center, Bethesda 14, Md *Chief Chemist* (2, 1928)
- Sevag, M G**, Ph D Univ of Pennsylvania School of Medicine, Dept of Bacteriology, Philadelphia 4 *Assoc Prof of Bacteriology* (2, 1949, 6, 1941)
- Sevringhaus, Elmer L**, M A, M D Hoffmann-La Roche Inc, Nutley 10, N J *Dir of Clin Research, Clin Prof of Medicine, New York Med College* (2, 1923, 5, 1939)
- Shaffer, C Boyd**, Ph D Mellon Inst, Pittsburgh 13, Pa *Sr Fellow* (3, 1950)
- Shaffer, Morris F**, Ph D Tulane Univ School of Medicine, Dept of Bacteriology, New Orleans, La *Professor* (4, 1939, 6, 1937)
- Shaffer, Philip A**, Ph D Washington Univ Med School, St Louis 10, Mo *Distinguished Service Prof of Biological Chemistry* (2, 1906)
- Shanes, Abraham M**, Ph D Natl Insts of Health, Exper Biology and Medicine Inst, Bethesda 14, Md (1, 1946)
- Shank, Robert E**, M D Washington Univ School of Medicine, St Louis 10, Mo *Prof of Preventive Medicine* (2, 1947)
- Shannon, James A**, Ph D, M D Squibb Inst for Med Research, New Brunswick, N J *Director* (1, 1933, 3, 1945)
- Shapiro, Herbert**, Ph D Henry Phipps Inst, 7th and Lombard Sts, Philadelphia 47, Pa *Research Assoc* (1, 1937)
- Sharpless, George R**, Sc D Lederle Labs, Pearl River N Y *Research Biochemist* (5, 1942)
- Shaw, J C**, Ph D Univ of Maryland, Dept of Dairy Husbandry, College Park, Md *Professor* (1, 1947)
- Shaw, James H**, Ph D Harvard School of Dental Medicine, Boston, Mass *Assoc in Nutrition* (5, 1948)
- Shaw, Myrtle**, Ph D 11 S Lake Ave Albany, N Y *Sr Bacteriologist, Div of Labs and Research, N Y State Dept of Health* (6, 1937)
- Shay, Harry**, M D Temple Univ School of Medicine, Philadelphia Pa *Dir of Fels Research Inst and Clin Prof of Medicine* (1, 1944)
- Shear, M J**, Ph D Natl Cancer Inst, Bethesda, 14, Md *Chief of Chemotherapy Section* (2, 1930)
- Sheard, Charles**, Ph D Mayo Foundation, Rochester, Minn *Chief of Div of Physics and Biophysical Research, Prof of Physiological Optics and Biophysics, Univ of Minnesota* (1, 1925)
- Sheehan Donal**, M D, D Sc New York Univ, Bellevue Med Center, 477 First Ave, New York City (1, 1938)
- Shelesnyak, M C**, Ph D Weizmann Inst of Science, Dept of Exper Biology, Rehovoth, Israel *Sr Scientist* (1, 1948)
- Shelley, Walter B**, Ph D, M D 353 Inwood Rd, Ardmore, Pa (1, 1946)
- Shemin, David**, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Assoc Prof of Biochemistry* (2, 1944)
- Sheppard, C W**, Ph D Oak Ridge Natl Lab, Biology Div, Oak Ridge, Tenn *Physicist* (1, 1950)
- Sheppard, Fay**, M S Univ of Oklahoma Med School Oklahoma City *Instr in Biochemistry* (2, 1936)
- Sherman, F G**, Ph D Brown Univ, Dept of Biology, Providence 12, R I *Asst Prof* (1, 1950)
- Sherman, Henry C**, Ph D Columbia Univ, New York City *Mitchell Prof Emeritus of Chemistry* (1R, 1923, 2, 1906, 5R, 1933)
- Sherman, William C**, Ph D Ralston Purina Co, St Louis, Mo *Head of Biological Labs* (5, 1949)
- Sherwin, Carl Paxson**, Sc D, M D, Dr P H 6 Carstensen Rd Scarsdale, N Y *Dir of Meta-*

- bolic Service, St Vincent's Hospital, Assoc Physician, French Hospital* (2, 1917)
- Sherwood, Noble P**, Ph D, M D Univ of Kansas, 517 Snow Hall, Lawrence *Prof of Bacteriology* (6, 1928)
- Sherwood, Thomas Cecil**, Ph D, M D 1824 Robert St, New Orleans, La *Southern Baptist Hospital Staff Member, Internal Medicine* (1, 1938)
- Shettles, Landrum B**, Ph D, M D Columbia Univ, College of Physicians and Surgeons, Box 330, 622 W 168th St, New York City (1, 1946)
- Shudeman, Frederick E**, Ph D, M D Univ of Michigan, Dept of Pharmacology, Ann Arbor *Assoc Prof* (3, 1944)
- Shuls, Maurice E**, Sc D 600 W 168th St, New York City 32 *Asst Prof of Nutrition, School of Public Health, Columbia Univ* (5, 1950)
- Shimkin, Michael Boris**, M D Univ of California Med School, San Francisco *Dir, Lab of Exper Oncology, Laguna Honda Home* (4, 1940)
- Shinowara, George Y**, Ph D Ohio State Univ College of Medicine, Columbus *Assoc Prof, Dept of Pathology, Chem Pathologist, Univ Hospital* (2, 1949)
- Shipley, Reginald A**, M D Western Reserve Univ School of Medicine, Cleveland 6, Ohio *Asst Prof of Medicine* (1, 1945)
- Shipley, Robert E**, M D Lilly Lab for Clin Research, Indianapolis City Hospital, Indianapolis, Ind (1, 1945)
- Shive, William**, Ph D Univ of Texas, Austin *Assoc Prof of Chemistry* (2, 1948)
- Shlaer, Simon**, Ph D Box 1663, Los Alamos, N M (1, 1938)
- Shock, Nathan W**, Ph D Baltimore City Hospitals, Baltimore 24, Md *Chief, Section on Gerontology, USPHS, Natl Insts of Health, Bethesda, Md* (1, 1942)
- Shoemaker, Harold A**, Ph D Univ of Oklahoma School of Medicine, 801 N E 13th St, Oklahoma City *Prof of Pharmacology* (3, 1941)
- Shope, Richard E**, M D Ridge Road, Kingston, N J *Merck Inst for Therapeutic Research* (4, 1934)
- Shorr, Ephraim**, M D New York Hospital, 525 E 68th St, New York City *Asst Attending Physician, Asst Prof of Medicine, Cornell Univ Med College* (1, 1931, 3, 1942)
- Shrigley, E W**, Ph D, M D Indiana Univ Med Center, Dept of Microbiology, 1040-1232 W Michigan St, Indianapolis 7 (6, 1946)
- Shwartzman, Gregory**, M D 230 E 50th St, New York City *Head of Dept of Bacteriology, Mount Sinai Hospital, Prof of Bacteriology, Columbia Univ* (4, 1929, 6, 1930)
- Sichel, F J M**, Ph D Univ of Vermont College of Medicine, Burlington *Prof and Chairman of Dept of Physiology and Biophysics* (1, 1939)
- Sickles, Grace M**, B A 2201 Twelfth St, Troy, N Y *Assoc Bacteriologist, Div of Labs and Research, New York State Dept of Health* (6, 1932)
- Sickles, Gretchen R**, A B New York State Dept of Health, Div of Labs and Research, Albany, N Y *Asst Bacteriologist* (6, 1937)
- Siebenmann, Charles O**, D Eng Connaught Med Research Labs, Univ of Toronto, Toronto 5, Ontario, Canada *Research Assoc, Assoc in Hygiene and Preventive Medicine* (3, 1946)
- Siebert, Walter J**, M D Lutheran Hospital, St Louis, Mo *Dir of Labs, Pathologist, Asst Prof, Washington Univ* (4, 1932)
- Siegmund, Otto Hanns**, D V M 409 B St, Davis, Calif *Jr Veterinarian, Asst Prof, Univ of California School of Veterinary Medicine* (3, 1950)
- Sigel, M Michael**, Ph D Children's Hospital, 1740 Bainbridge St, Philadelphia 46, Pa *Assoc in Virology, Univ of Pennsylvania* (6, 1950)
- Silber, Robert H**, Ph D Merck Inst, Rahway, N J *Head, Dept of Biochemistry* (2, 1948)
- Silberberg, Martin**, M D Snodgrass Lab of Pathology, 1430 Carroll St, St Louis 4, Mo *Asst Prof of Pathology, Washington Univ School of Medicine, Pathologist, Hospital Div, City of St Louis* (4, 1944)
- Silberberg, Ruth**, M D Snodgrass Lab of Pathology, 1430 Carroll St, St Louis 4, Mo *Asst Prof of Pathology, Washington Univ School of Medicine, Pathologist, Hospital Div, City of St Louis* (4, 1944)
- Silverman, Milton**, Ph D Natl Insts of Health, Bethesda 14, Md *Scientist, Exper Biology and Medicine Inst* (2, 1950)
- Silvette, Herbert**, Ph D Meharry Med College, Nashville, Tenn *Visiting Prof of Pharmacology* (1, 1933, 3, 1940)
- Simmonds, Sofia**, Ph D Yale Univ, Osborn Botanical Lab, New Haven 11, Conn *Asst Prof of Microbiology and Biochemistry* (2, 1948)
- Simonds, James P**, Ph D, M D 2033 W Morse Ave, Chicago 45, Ill *Prof Emeritus of Pathology, Northwestern Univ Med School* (4, prior to 1920)
- Smonsens, Daisy G**, Ph D Los Angeles County Hospital, 1200 N State St, Los Angeles 33, Calif *Chemist and Toxicologist, Instr in Medicine, Univ of Southern California Med School* (2, 1949)
- Simonson, Ernst**, M D Univ of Minnesota, Lab of Physiological Hygiene, Stadium South Tower, Minneapolis 14 *Assoc Prof of Physiology* (1, 1941)
- Simpson, Miriam E**, Ph D, M D Univ of California, Berkeley *Prof of Anatomy* (1, 1946)
- Singal, Sam A**, Ph D Med College of Georgia, Augusta *Assoc Prof of Biochemistry* (2, 1948)
- Singer, Thomas P**, Ph D Western Reserve Univ,

- Cleveland, Ohio *Asst Prof of Biochemistry* (2, 1948)
- Sizer, Irwin W, Ph D Massachusetts Inst of Technology, Cambridge *Assoc Prof of Physiology* (1, 1944)
- Skinner, John Taylor, Ph D The Grapette Co, Camden, Ark *Chief Chemist* (2, 1946)
- Slaughter, Donald, M D Univ of South Dakota School of Med Sciences, Vermillion *Dean* (3, 1938)
- Slonaker, James R, Ph D 334 Kingsley Ave, Palo Alto, Calif *Prof of Physiology, Leland Stanford Jr Univ* (1R, 1917)
- Smadel, Joseph Edwin, M D Army Med Dept, Research and Grad School, Washington 12, D C *Chief, Dept of Virus and Rickettsial Diseases* (4, 1940, 6, 1937)
- Small, James C, M D 101 S 39th St, Philadelphia, Pa *Assoc in Medicine, Univ of Pennsylvania Grad School of Medicine* (4, 1927)
- Smetana, Hans F, M D Armed Forces Inst of Pathology, 7th St and Independence Ave, Washington 25, D C *Chief, Dept of Pathology* (4, 1934)
- Smith, Arthur H, Ph D Wayne Univ College of Medicine, Detroit 26, Mich *Prof of Physiological Chemistry* (2, 1921, 5, 1933)
- Smith, Austin Edward, M D American Med Assoc, 535 N Dearborn St, Chicago, Ill *Editor, J A M A* (3, 1942)
- Smith, Clarence A, Ph D Standard Brands, Inc, 595 Madison Ave, New York City *Technical Dir, Agricultural Dept* (1, 1921)
- Smith, David T, M D Duke Hospital, Durham, N C *Prof of Bacteriology and Assoc Prof of Medicine* (5, 1943, 6, 1949)
- Smith, Dietrich Conrad, Ph D Univ of Maryland School of Medicine, Lombard and Greene Sts, Baltimore *Assoc Prof of Physiology* (1, 1937)
- Smith, Douglas E, Ph D Argonne Natl Lab, P O Box 5207, Chicago 80, Ill (1, 1947)
- Smith, Edwin L, Ph D Univ of Texas Dental School, Houston *Prof of Physiology* (1, 1948)
- Smith, Elinor Van Dorn, Ph D Smith College, Northampton, Mass *Assoc Prof of Bacteriology* (6, 1940)
- Smith, Elizabeth R B, Ph D % Dr Paul K Smith, 1335 H St, N W, Washington 5, D C (2, 1938)
- Smith, Emil L, Ph D Univ of Utah School of Medicine, Salt Lake City 1 *Prof of Biochemistry, Research Prof of Medicine* (2, 1946)
- Smith, Erma A, Ph D, M D S H Camp Co, Jackson, Mich (1, 1928)
- Smith, Falconer, Ph D 6920 Tilden Lane, Rockville, Md *Scientist (officer), USPHS, Research in Radiobiology* (1, 1950)
- Smith, George H, Ph D Yale Univ School of Medicine, New Haven, Conn *Prof of Immunology and Asst Dean, Chairman of Dept of Bacteriology, Yale Univ* (6, 1918)
- Smith, H P, M S, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 *Delafield Prof of Pathology* (1, 1937, 4, 1925)
- Smith, Homer W, Sc D New York Univ, Bellevue Med Center, 477 First Ave, New York City *Prof of Physiology* (1, 1923, 2, 1930)
- Smith, Janice M, Ph D Univ of Illinois, Dept of Home Economics, Urbana *Prof and Chief of Nutrition* (5, 1947)
- Smith, John R, A M, M D Washington Univ School of Medicine, St Louis 10, Mo *Asst Prof of Medicine* (1, 1947)
- Smith, Lawrence Weld, M D 119 E 26th St, New York City 10 (4, 1927)
- Smith, Lee Irvin, Ph D Univ of Minnesota School of Chemistry, Minneapolis 14 *Prof and Chief of Div of Organic Chemistry* (2, 1942)
- Smith, Margaret Cammack, Ph D El Encanto Estates, Tucson, Ariz (5, 1933)
- Smith, Margaret H D, M D, B es lettres Tulane Univ, 1430 Tulane Ave, New Orleans, La *Asst Prof of Pediatrics* (6, 1950)
- Smith, Maurice I, M D 8415 Lynbrook Dr, Bethesda, Md *Principal Pharmacologist, Retired, USPHS* (1R 1920, 3R, 1916)
- Smith, Paul K, Ph D George Washington Univ School of Medicine, 1335 H St, N W, Washington 5, D C *Prof of Pharmacology and Exec Officer of Dept* (2, 1937, 3, 1937)
- Smith, Paul W, Ph D Univ of Oklahoma School of Medicine, 801 E 13th St, Oklahoma City *Assoc Prof of Pharmacology* (1, 1933)
- Smith, Philip Edward, Ph D Columbia Univ, 630 W 168th St, New York City 32 *Prof of Anatomy* (1, 1923)
- Smith, Ralph G, M D, Ph D Federal Security Agency, Food and Drug Admin, Washington 25, D C *Med Officer, Chief of New Drug Section* (3, 1929)
- Smith, R Blackwell, Jr, Ph D Med College of Virginia, Richmond 19 *Assoc Prof of Pharmacology* (3, 1944)
- Smith, Sedgwick E, Ph D Cornell Univ, Dept of Animal Husbandry, Ithaca, N Y *Animal Physiologist* (5, 1945)
- Smith, Susan Gower, M A Duke Univ, Durham, N C *Assoc in Dept of Medicine and Nutrition, School of Medicine* (5, 1939)
- Smith, Sybil L, A M 1421 44th St, N W, Washington, D C (5, 1940)
- Smith, Wilbur Kenneth, M D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Assoc Prof of Anatomy* (1, 1939)
- Smith, Willie W, Ph D Natl Insts of Health, Bethesda, Md *Physiologist* (1, 1941)
- Smithburn, Kenneth C, M D Rockefeller Foun-

- dation, 49 W 49th St , New York City *Staff Member, International Health Div* (6, 1937)
- Smolens, Joseph, B S Children's Hospital, 1740 Bainbridge St , Philadelphia, Pa (6, 1943)
- Smythe, C V , Ph D 5000 Richmond St , Philadelphia, Pa *Head of Biochemistry, Rohm & Haas Co* (2, 1934)
- Snape, William J , M D Jefferson Med College, Philadelphia, Pa *Assoc in Physiology* (1, 1948)
- Snell, Albert M , M D Palo Alto Clinic, 300 Homer St , Palo Alto, Calif (4, 1930)
- Snell, Esmond E , Ph D Univ of Wisconsin, Madison 6 *Prof of Biochemistry* (2, 1942, 5, 1946)
- Snider, Ray S , Ph D Northwestern Univ School of Medicine, 303 E Chicago Ave , Chicago 11, Ill *Assoc Prof of Anatomy* (1, 1949)
- Snyder, Charles D , Ph D 4709 Keswick Rd , Baltimore, Md *Prof Emeritus of Exper Physiology, Johns Hopkins Univ* (1R, 1907)
- Snyder, Franklin Faust, M D Boston Lying-In Hospital, Boston, Mass (1, 1936)
- Snyder, John Crayton, M D Harvard School of Public Health, 695 Huntington Ave , Boston, Mass *Prof of Microbiology* (6, 1950)
- Sobel, Albert E , Ph D Jewish Hospital of Brooklyn, 555 Prospect Pl , Brooklyn 16, N Y *Head of Dept of Chemistry, Special Lecturer, Long Island College of Medicine* (2, 1939)
- Sobin, Sidney S , M D , Ph D 405 N Bedford Drive, Beverly Hills, Calif *Research Assoc in Physiology, Univ of Southern California* (1, 1949)
- Sobotka, Harry H , Ph D Mount Sinai Hospital, Fifth Ave and 100th St , New York City 29 *Head of Dept of Chemistry* (2, 1932, 5, 1933)
- Solandt, Donald Young, M D , Ph D Univ of Toronto, Toronto, Ontario, Canada *Prof of Physiology in charge of Biophysics, Faculty of Medicine, Prof and Head of Dept of Hygiene, School of Hygiene* (1, 1937)
- Sollmann, Torald, M D 14327 Superior Rd , Cleveland, Ohio *Dean and Prof Emeritus of Pharmacology, Western Reserve Univ* (1R, 1902, 2, 1906, 3, 1908)
- Solotorovsky, Morris, Ph D 203 W 5th St , Plainfield, N J *Merck Inst for Therapeutic Research, Rahway, N J , Research Assoc in Chemotherapy* (6, 1946)
- Somogyi, Michael, Ph D 216 S Kingshighway, St Louis, Mo *Biochemist, Jewish Hospital of St Louis* (2, 1927)
- Sonnenschein, Ralph R , M D , Ph D Univ of Illinois, College of Medicine, Chicago 12 *Research Asst in Psychiatry* (1, 1950)
- Soskin, Samuel, M D , Ph D Michael Reese Hospital, 29th St and Ellis Ave , Chicago 16, Ill *Med Dir and Dir of Research Inst , Dean, Postgrad School* (1, 1930, 5, 1933)
- Soule, Malcolm H , Sc D Univ of Michigan, Ann Arbor *Prof of Bacteriology, and Chairman of Dept of Bacteriology* (4, 1927, 6, 1925)
- Spain, Will C , M D 116 E 53rd St , New York City *Chn Prof of Medicine, Post-Grad Med School, Columbia Univ* (6, 1923)
- Spaulding, Earle H , Ph D Temple Univ , School of Medicine, Broad St at Ontario, Philadelphia 40, Pa *Prof of Bacteriology, Head of Dept* (6, 1950)
- Speelman, C R , Ph D Dept of Commerce, Civil Aeronautics Admin , Washington 25, D C (1, 1940)
- Specht, Heinz, Ph D Natl Insts of Health, Bethesda, Md *Scientist, USPHS* (1, 1941)
- Spector, Harry, Ph D Quartermaster Food and Container Inst for the Armed Forces, 1849 W Pershing Rd , Chicago 9, Ill *Chief, Nutrition Div* (5, 1950)
- Speirs, Mary, Ph D Georgia Agricultural Exper Station, Experiment *Head of Dept of Home Economics* (5, 1949)
- Sperry, Roger W , Ph D Univ of Chicago, Dept of Anatomy, Chicago 37, Ill (1, 1945)
- Sperry, Warren M , Ph D New York State Psychiatric Inst , 722 W 168th St , New York City 32 *Principal Research Biochemist, Assoc Prof of Biological Chemistry, Columbia Univ* (2, 1929, 5, 1933)
- Spicer, Samuel S , M D Natl Insts of Health, Bethesda 14, Md *Commissioned Officer, USPHS, Surgeon* (1, 1950)
- Spiegel, Ernest A , M D Temple Univ School of Medicine, Broad and Ontario Sts , Philadelphia, Pa *Prof of Exper Neurology* (1, 1936)
- Spiegel-Adolf Mona, M D Temple Univ School of Medicine, Broad and Ontario Sts Philadelphia, Pa *Prof and Head of Dept of Colloid Chemistry* (2, 1933)
- Spiegelman, Sol, Ph D Univ of Illinois, Dept of Bacteriology, Urbana (1, 1946)
- Spies, Tom D , M D Hillman Hospital, Birmingham, Ala *Dir of Nutrition Clinic* (3, 1941, 4, 1940, 5, 1938)
- Spink, Wesley W , M D Univ of Minnesota Hospital, Minneapolis *Assoc Prof of Medicine, Univ of Minnesota Med School* (6, 1940)
- Spohn, Adelaide, Ph D Elizabeth McCormick Memorial Fund, 848 N Dearborn St , Chicago, Ill *Nutritionist* (5, 1933)
- Spoor, Herbert J , Ph D , M D 6705A 186th Lane, Flushing, L I , N Y *Dir , Dermatological Research, New York Med College* (1, 1945)
- Sprent, J F A , Ph D Univ of Toronto, 43 Queens Park, Toronto 5, Ontario, Canada *Asst Prof , Sr Research Fellow, Ontario Research Foundation* (6, 1949)

- Sprinson, David B**, Ph D Columbia Univ College of Physicians and Surgeons, Dept of Biochemistry, 630 W 168th St, New York City 32 *Research Assoc* (2, 1949)
- Sproul, Edith E**, M D Columbia Univ College of Physicians and Surgeons, Dept of Pathology, 630 W 168th St, New York City 32 *Assoc Prof* (4, 1941)
- Sprunt, Douglas H**, M D, M S Univ of Tennessee, Memphis *Prof of Pathology, Head of Dept. of Pathology and Bacteriology* (4, 1934, 6, 1936)
- Stacy, Ralph W**, Ph D Ohio State Univ, Dept of Physiology, Hamilton Hall, Columbus 10 *Asst Prof* (1, 1949)
- Stadie, William C**, M D 821 Maloney Clinic, 36th and Spruce Sts, Philadelphia 4, Pa *John Herr Musser Prof of Research Medicine, Univ of Pennsylvania* (2, 1922)
- Stanley, Wendell M**, Ph D Univ of California, Rm 223, Forestry Bldg, Berkeley 4 *Prof and Chairman of Dept of Biochemistry, Dir of Virus Lab* (2, 1936)
- Stannard, James Newell**, Ph D Univ of Rochester Med School, Atomic Energy Project, Rochester 7, N Y *Assoc Prof of Radiation Biology* (1, 1938)
- Stansly, Philip G**, Ph.D American Cyanamid Co, Stamford Research Labs, Stamford, Conn *Microbiologist, Chemotherapy Dept* (2, 1950)
- Stare, Fredrick J**, Ph D, M D 695 Huntington Ave, Boston 15, Mass *Prof of Nutrition, Harvard Univ* (2, 1937, 5, 1942)
- Starr, Isaac**, M D Hospital of the Univ of Pennsylvania, Philadelphia *Hartzell Prof of Research Therapeutics* (1, 1929, 3, 1942)
- Stavitsky, Abram B**, Ph D, V.M D Western Reserve Univ School of Medicine, 2109 Adelbert Rd, Cleveland 6, Ohio *Asst Prof of Microbiology* (6, 1950)
- Stavraky, George W**, M D Univ of Western Ontario, Med School, London, Ontario, Canada *Prof of Physiology* (1, 1937, 3, 1944)
- Stead, Eugene A, Jr**, M D Duke Univ, Dept of Medicine, Durham N C (1, 1945)
- Stearns, Genevieve**, Ph D State Univ of Iowa, College of Medicine, Iowa City *Research Prof of Pediatrics* (2, 1932, 5, 1937)
- Steel, Matthew**, Ph D New York State Univ Med Center at New York City, 350 Henry St, Brooklyn, N Y *Prof of Biological Chemistry* (2, 1909)
- Steele, J Murray**, M D Third (N Y U) Research Div, Goldwater Memorial Hospital, Welfare Island, New York City *Assoc Prof of Medicine, New York Univ, Dir of 3rd Med Div, Welfare Hospital* (1, 1936)
- Steenbock, Harry**, Ph D Univ of Wisconsin, Madison *Prof of Biochemistry* (2, 1912, 5, 1933)
- Steffee, C Harold**, M D, Ph D U S Marine Hospital, Dept of Pathology, New Orleans 15, La *Resident* (4, 1950)
- Steggerda, F R**, Ph D Univ of Illinois, 416 Natural History Bldg, Urbana *Assoc Prof of Physiology* (1, 1934)
- Stehle, Raymond Louis**, Ph D McGill Univ, Faculty of Medicine, Montreal, Quebec, Canada *Prof of Pharmacology* (2, 1920, 3, 1922)
- Steigman, Alex J**, M S, M D Louisville General Hospital, E Chestnut St, Louisville 21, Ky *Consultant Clin Epidemiologist, Nat'l Foundation for Infantile Paralysis* (6, 1949)
- Steigmann, Frederick**, M S, M D 348 S Hamlin Ave, Chicago, Ill *Assoc in Medicine, Univ of Illinois, College of Medicine, Assoc Attending Physician, Cook County Hospital* (3, 1942)
- Steiman, S E**, Ph D, M D 23 Broad St, Lynn, Mass *Asst Physician, Metropolitan State Hospital, Waltham, Mass* (1, 1939)
- Stein, George J**, Ph D 406th Med General Lab APO 500 %P M, San Francisco, Calif *Chief, Section of Bacteriology and Serology* (6, 1947)
- Stein, William Howard**, Ph D Rockefeller Inst for Med Research, 66th and York Ave, New York City 21 *Assoc in Chemistry* (2, 1946)
- Steinbach, H Burr**, Ph D Univ of Minnesota, Dept of Zoology, Minneapolis (1, 1934)
- Steinberg, Bernhard**, M.D Toledo Hospital Inst of Med Research, Toledo, Ohio *Dir of Toledo Hospital Inst, Chief Pathologist and Dir of Labs, Toledo Hospital* (4, 1928, 6, 1946)
- Steiner, Paul E**, M D Univ of Chicago, Chicago, Ill *Prof of Pathology* (4, 1939)
- Steinhardt, Jacinto**, Ph.D 4004 Laird Pl, Chevy Chase 15, Md *Dir, Operations Evaluation Group, Mass Inst of Technology* (2, 1939)
- Steinhaus, Arthur H**, Ph D 5315 Drexel Ave, Chicago, Ill *Prof of Physiology, George Williams College, Hyde Park* (1, 1928)
- Stekol, Jakob A**, D Sc Lankenau Hospital Research Inst, Philadelphia 30, Pa *Assoc Member* (2, 1936)
- Stern, Kurt G**, Ph D Polytechnic Inst of Brooklyn, 99 Livingston St, Brooklyn 2, N Y *Adjunct Prof of Biochemistry* (2, 1938)
- Stetten, DeWitt, Jr**, M D, Ph D Public Health Research Inst of The City of New York, Inc, Foot of E 15th St, New York City 9 *Chief, Div of Nutrition and Physiology* (2, 1944)
- Stetten, Marjorie R**, Ph D Public Health Research Inst of The City of New York, Inc, Foot of E 15th St, New York City 9 *Assoc, Div of Nutrition and Physiology* (2, 1947)
- Stevens, S Smith**, Ph D Harvard Univ, Memorial Hall, Cambridge, Mass *Prof of Psychology, Dir of Psychological Labs* (1, 1937)
- Stevenson, James A F**, M A, M D C.M Univ of Western Ontario, Dept of Med Research,

- London, Ontario, Canada *Assoc Prof, Lecturer in Physiology* (1, 1950)
- Stewart, Dorothy R**, Ph D Rockford College, Rockford, Ill (1, 1947)
- Stewart, Fred W**, M D Memorial Hospital, 444 E 68th St, New York City *Pathologist, Prof of Pathology, Cornell Med School* (4, 1928)
- Stewart, Harold L**, M D Natl Cancer Inst, Bethesda, Md *Chief of Pathology Section* (4, 1936)
- Stewart, Wellington B**, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City *Assoc in Pathology* (4, 1950)
- Stewart, Winifred Bayard**, M D, M A 1930 Spruce St, Philadelphia, Pa *Prof of Neurology, Woman's Med College of Pennsylvania* (1, 1941)
- Stuckney, J Clifford**, Ph D West Virginia Univ School of Medicine Morgantown *Assoc Prof of Physiology* (1, 1944)
- Stiebeling, Hazel K**, Ph D U S Dept of Agriculture, Washington, D C *Chief, Bureau of Human Nutrition and Home Economics* (5, 1933)
- Stier, Theodore J B**, Ph D Indiana Univ Med School, Bloomington *Assoc Prof of Physiology* (1, 1938)
- Still, Eugene U**, Ph D Box 991, Sarasota, Fla (1, 1929)
- Stummel, Benjamin F**, Ph D Rees Stealy Med Research Fund, Ltd, 2001 Fourth Ave, San Diego, Calif *Research Biochemist* (2, 1947)
- Stock, Aaron H**, M D Children's Hospital of Pittsburgh 125 De Soto St, Pittsburgh, Pa (6, 1947)
- Stockton, Andrew Benton**, M D 655 Sutter St, San Francisco, Calif *Asst Clin Prof of Medicine* (3, 1931)
- Stoerk, Herbert C**, M D Merck Inst for Therapeutic Research Rahway, N J *Head of Dept of Cancer Research* (4, 1948)
- Stoesser, Albert V**, M D, Ph D Univ of Minnesota Med School, 1409 Willow St, Loring Park, Minneapolis *Clin Assoc Prof of Pediatrics* (6, 1949)
- Stohlman, Edward F**, LL B Natl Insts of Health, Bethesda, Md *Assoc Pharmacologist* (3, 1948)
- Stokinger, Herbert E**, Ph D A E Project, Univ of Rochester, P O Box 287, Station 3, Rochester N Y *Assoc Prof of Pharmacology, Chief of Industrial Hygiene and Toxicology* (3, 1950, 6, 1947)
- Stokstad, E L Robert**, Ph D Lederle Labs, Pearl River, N Y *Asst Dir, Nutrition and Physiology Dept* (2, 1947, 5, 1942)
- Stoland, O O**, Ph D 1845 Learned Ave, Lawrence, Kan *Prof of Physiology and Pharmacology, Univ of Kansas* (1, 1913)
- Stone, Gilbert C H** Ph D City College of New York, Dept of Chemistry, Convent Ave and 140th St, New York City *Asst Prof* (2, 1950)
- Stone, William E**, Ph D Univ of Wisconsin, Dept of Physiology, Madison *Asst Prof of Physiology* (1, 1945)
- Stormont, Robert T**, Ph D, M D American Med Assoc, 535 N Dearborn St, Chicago, Ill *Sec of Council on Pharmacy and Chemistry* (3, 1941)
- Storvick, Clara A**, Ph D Oregon State College, School of Home Economics, Corvallis, Ore *Assoc Prof of Foods and Nutrition* (5, 1947)
- Stotz, Elmer, H**, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester 20, N Y *Prof of Biochemistry* (2, 1939)
- Stoughton, Roger W**, Ph D Mallinckrodt Chemical Works, 3600 N Second St, St Louis, Mo *Research Chemist* (3, 1939)
- Strong, Frank M**, Ph D Univ of Wisconsin, Dept of Biochemistry, Madison 6 *Prof of Biochemistry* (2, 1941)
- Struck, Harold Carl**, Ph D Creighton Univ School of Medicine, 302 N 14th St, Omaha 2, Nebr (1, 1940)
- Stuart, Charles A**, Ph D 372 Lloyd Ave, Providence, R I *Assoc Prof of Biology, Brown Univ* (6, 1935)
- Stumpf, Paul K**, Ph D Univ of California, Div of Plant Biochemistry, 3048 Life Science Bldg, Berkeley 4 *Asst Prof* (2, 1950)
- Sturgis, Cyrus Cressey**, M D Simpson Memorial Inst, Ann Arbor, Mich *Dir of Thomas Henry Simpson Memorial Inst for Med Research, Chairman, Dept of Medicine, Univ of Michigan Hospital* (4, 1927)
- Sturkie, Paul D**, Ph D Rutgers Univ, New Brunswick, N J *Assoc Research Specialist in Poultry Husbandry, Assoc Prof of Poultry Husbandry* (1, 1948)
- Stutzman, Jacob W**, Ph D, M D Boston Univ School of Medicine, Boston, Mass *Assoc Prof of Pharmacology* (1, 1946, 3, 1948)
- Sugg, John Y**, Ph D Cornell Univ Med College, 1300 York Ave, New York City *Assoc Prof of Bacteriology and Immunology* (6, 1938)
- Sulkin, S Edward**, Ph D Southwestern Med College, Dallas, Tex *Prof and Chairman of Dept of Bacteriology and Immunology* (6, 1944)
- Sullivan, Michael Xavier**, Ph D Chemo-Medical Research Inst, Georgetown Univ, 37th & O Sts, N W, Washington, D C *Dir and Research Prof of Chemistry* (2, 1909)
- Sulzberger, Marion B**, M D 999 5th Ave, New York City *Assoc Clin Prof of Dermatology and Syphilology, N Y Post-Grad Med School of Columbia Univ, Assoc Dir of Skin and Cancer Unit of N Y Post-Grad Hospital* (6, 1936)
- Summerson, William H**, Ph D Med Div, Army

- Chemical Center, Md *Chief, Biochemistry Section* (2, 1942)
- Sumner, J B, Ph D Cornell Univ, Ithaca, N Y *Dir, Enzyme Chemistry Lab* (2, 1919)
- Sunderman, F William, M D, Ph D Grady Memorial Hospital, 36 Butler St, S E Atlanta 3, Ga *Dir, Clin Labs, Prof, Clin Medicine, Emory Univ* (2, 1931)
- Sundstroem, Edward S, M D Univ of California, Berkeley 4 *Prof Emeritus of Biochemistry* (2, 1919)
- Sure, Barnett, Ph D Univ of Arkansas, Fayetteville *Head of Dept and Prof of Agricultural Chemistry* (2, 1923, 5, 1933)
- Sutherland, Earl W, Jr, M D Washington Univ School of Medicine, Dept of Biological Chemistry, St Louis 10, Mo *Asst Prof* (2, 1950)
- Sutherland, George F, M D Duke Univ School of Medicine, Durham, N C (1, 1939)
- Sutton, T Scott, Ph D Ohio State Univ, Columbus *Prof, Dir of Inst of Nutrition and Food Technology* (5, 1936)
- Svirbely, Joseph L, Ph D 1002 Fawcett Ave, McKeesport, Pa (3, 1945)
- Swain, Robert E, Ph D 634 Mirada Ave, Stanford Univ, Calif *Prof Emeritus of Chemistry* (2, 1909)
- Swann, Howard G, Ph D Univ of Texas Med School, Dept of Physiology, Galveston *Asst Prof of Physiology* (1, 1940)
- Swanson, Marjorie A, Ph D Bowman Gray School of Medicine, Dept of Biochemistry, Winston-Salem 7, N C *Asst Prof* (2, 1950)
- Swanson, Pearl P, Ph D Iowa State College, Ames *Prof of Foods and Nutrition, Dept of Foods and Nutrition* (5, 1933)
- Swanson, William W, M S, M D 2376 E 71st St, Chicago, Ill *Asst Prof of Pediatrics, Northwestern Univ* (2, 1938)
- Sweeney, H Morrow, Ph D Aero-Med Lab, Wright-Patterson Air Force Base, Dayton, Ohio (1, 1939)
- Sweet, J E, M D, Sc D Unadilla, N Y *Prof Emeritus of Surgical Research, Cornell Univ Med College* (1R, 1913)
- Swendseid, Marian E, Ph D Univ of Michigan, Simpson Memorial Inst, Ann Arbor *Research Biochemist* (2, 1950)
- Swift, Homer, M D, D Sc 888 Park Ave, New York City *Member, Rockefeller Inst for Med Research, Physician to Hospital of Rockefeller Inst for Med Research* (6, 1920)
- Swift, Raymond W, Ph D Pennsylvania State College, State College *Prof and Head of Dept of Animal Nutrition* (5, 1934)
- Swingle, Wilbur Willis, Ph D Princeton Univ, Princeton, N J *Prof of Biology* (1, 1924)
- Swinyard, Ewart A, Ph D Univ of Utah, Salt Lake City *Prof of Pharmacy, School of Pharmacy* (3, 1948)
- Sydenstricker, V P, M D Med College of Georgia, Augusta *Prof of Medicine* (5, 1944)
- Sykes, Joseph F, Ph D U S Dept of Agriculture, Bureau of Dairy Industry, Beltsville, Md *Physiologist* (1, 1942)
- Syvertson, Jerome T, M D Univ of Minnesota, Minneapolis, Minn *Prof and Head, Dept of Bacteriology and Immunology* (4, 1940, 6, 1947)
- Szego, Clara M, Ph D Univ of California, Med School, Los Angeles *Asst Prof of Zoology* (1, 1946)
- Szent-Gyorgyi, Albert, Ph D, M D Natl Insts of Health, Bethesda 14, Md (2, 1949)
- Szepsenwol, Josel, M D Emory Univ School of Medicine, Emory University, Ga *Asst Prof of Anatomy* (1, 1948)
- Tabor, Herbert, M D Natl Insts of Health, Pharmacology Section, Exper Biology and Medicine Inst, Bethesda 14, Md *Surgeon, USPHS* (3, 1947)
- Tager, Morris Western Reserve Univ, Cleveland, Ohio *Dept of Microbiology* (6, 1948)
- Tainter, M L, M A, M D Sterling-Winthrop Research Inst, 33 Riverside Ave, Rensselaer, N Y *Director* (1, 1929, 3, 1927)
- Talbot, Samuel Armstrong, Ph D Johns Hopkins Hospital, Baltimore, Md *Instr in Physiological Optics, Johns Hopkins Univ* (1, 1940)
- Taliaferro, William H, Ph D Univ of Chicago, Dept of Bacteriology, Chicago, Ill *Ehakim H Moore Distinguished Service Prof of Parasitology and Dean of Div of Biological Sciences* (6, 1930)
- Tannenbaum, Albert, M D Michael Reese Hospital, 29th St & Ellis Ave, Chicago, Ill *Dir of Dept of Cancer Research* (4, 1942)
- Tarr, H L A, Ph D Fisheries Exper Station, 898 Richards St, Vancouver, B C, Canada *Sr Bacteriologist, Dept of Bacteriology* (2, 1950)
- Tarver, Harold, Ph D Univ of California, Div of Biochemistry, Berkeley 4 *Asst Prof of Biochemistry* (2, 1947)
- Tashiro, Shiro, Ph D, M D Univ of Cincinnati College of Medicine, Cincinnati, Ohio *Prof of Biochemistry* (1, 1913, 2, 1913)
- Tatum, Arthur L, Ph D, M D Service Memorial Inst, Univ of Wisconsin, Madison *Prof of Pharmacology* (1, 1913, 3, 1919)
- Tatum, Edward L, Ph D Stanford Univ, School of Biological Sciences, Stanford University, Calif *Prof of Biology* (2, 1947)
- Tauber, Henry, Ph D V D Venereal Disease Exper Lab, USPHS, Chapel Hill, N C *Sr Biochemist Assoc Prof of Exper Medicine, School of Public Health Univ of North Carolina* (2, 1933)
- Taylor, A N, Ph D Univ of Oklahoma School

- of Medicine, Oklahoma City *Asst Prof and Chairman of Dept of Physiology* (1, 1948)
- Taylor, Alton R**, Ph D Parke, Davis & Co, Detroit 32, Mich *Sr Researcher, Research Div* (2, 1947)
- Taylor, Craig L**, Ph D Univ of California, Dept of Engineering, Los Angeles *Assoc Prof of Engineering* (1, 1945)
- Taylor, Dermot B**, M B, B Ch, B A O Univ of California Med Center, San Francisco 22 *Assoc Prof of Pharmacology* (3, 1950)
- Taylor, Fred A**, Ph D 320 E North Ave, N S, Pittsburgh, Pa *Biochemist, Singer Memorial Lab* (2, 1933)
- Taylor & Haywood M**, Ph D Duke Univ School of Medicine, Durham, N C *Prof of Toxicology and Assoc Prof of Biochemistry, Biochemist and Toxicologist to Duke Hospital* (4, 1942)
- Taylor, Henry Longstreet**, Ph D Univ of Minnesota, School of Public Health, Minneapolis *Prof of Physiological Hygiene* (1, 1944)
- Taylor, John Fuller**, Ph D Washington Univ School of Medicine, Euclid and Kingshighway, St Louis, Mo *Asst Prof of Biological Chemistry* (2, 1944)
- Taylor, M Wight**, Ph D New Jersey Agricultural Exper Station, New Brunswick *Assoc Biochemist in Nutrition and Assoc Prof of Agricultural Biochemistry, Rutgers Univ* (5, 1944)
- Taylor, Norman Burke**, M D Univ of Toronto, Toronto 5, Ontario, Canada *Prof of Physiology* (1, 1922)
- Taylor, Richard M**, Rockefeller Foundation, 66th St and York Ave, New York City *Member Staff, Internatl Health Div* (6, 1949)
- Taylor, Robert D**, M D Clinical Research Div, Cleveland Foundation, Cleveland 6, Ohio *Member* (1, 1945)
- Teague, Robert S**, Ph D, M D Medical College of Alabama, Dept of Pharmacology, Birmingham 5 *Prof and Chairman of Dept of Pharmacology* (3, 1942)
- Templeton, Roy D**, B S 133 Handley St, San Antonio, Tex (1, 1935)
- Ten Broeck, Carl**, M D 94 Battle Rd, Princeton, N J (4R, 1932)
- Tepley, Lester J**, Ph D Univ of Wisconsin, Enzyme Inst, 1702 University Ave, Madison *Project Assoc* (2, 1950)
- Tepperman, Jay**, M D State Univ of New York School of Medicine, Dept of Pharmacology, Syracuse, N Y *Assoc Prof of Pharmacology* (1, 1944)
- Terplan, Kornel L**, M D Univ of Buffalo School of Medicine, Buffalo, N Y *Prof of Pathology* (4, 1935)
- Terry, Roger**, M D Univ of Rochester School of Medicine and Dentistry, Dept of Pathology, Rochester 7, N Y *Instr in Pathology* (4, 1949)
- Thannhauser, S J**, M D, Ph D Pratt Diagnostic Hospital, 30 Bennet St, Boston, Mass *Assoc Chief, Prof of Clin Medicine, Tufts Med School* (2, 1937)
- Thatcher, Jonathan S**, M D, Ph D State College of Washington, Finch Memorial Hospital, Pullman *Staff Physician* (1, 1949)
- Thauer, Rudolf**, M D 5628 Uber St, Philadelphia 41, Pa *Physiologist, Research Work in N A M C U S Navy* (1, 1949)
- Thayer, Sidney Allen**, Ph D 1402 S Grand Blvd, St Louis 4, Mo *Assoc Prof of Biochemistry, St Louis Univ School of Medicine* (2, 1933)
- Therman, Per-Olof**, M D 111 N 49th St, Philadelphia 39, Pa *Neurophysiologist, Pennsylvania Hospital, Asst Prof, Univ of Pennsylvania* (1, 1950)
- Thienes, Clinton H**, M D, Ph D Univ of Southern California School of Medicine, Los Angeles *Prof and Head of Dept of Pharmacology and Toxicology* (3, 1928)
- Thomas, Arthur W**, Ph D Columbia Univ, New York City 27 *Prof of Chemistry* (2, 1924)
- Thomas, Byron H**, Ph D Iowa State College, Ames *Prof and Head of Animal Chemistry and Nutrition, Iowa Agric Exper Station* (5, 1933)
- Thomas, Caroline Bedell**, M D Johns Hopkins Hospital, Baltimore, Md *Assoc Prof of Medicine, Johns Hopkins Univ School of Medicine* (1, 1939)
- Thomas, J Earl**, M D Jefferson Med College, Philadelphia, Pa *Prof of Physiology* (1, 1922, 3, 1924)
- Thomas, Lewis**, M D Tulane Univ Med School, New Orleans, La *Assoc Prof of Medicine* (6, 1950)
- Thompson, Marvin R**, Ph D 67 Greenwich Ave, Stamford, Conn (3, 1944)
- Thompson, Randall L**, Sc D, M D Indiana Univ, Med Center, Indianapolis 7 *Prof of Bacteriology* (6, 1937)
- Thompson, William R**, Ph D 1 Darroch Rd, Delmar, N Y *Sr Biochemist, Div of Labs and Research, New York State Dept of Health* (2, 1934)
- Thomson, David Landsborough**, Ph D McGill Univ, Montreal, Quebec, Canada *Prof of Biochemistry and Dean of Faculty of Grad Studies and Research* (2, 1929)
- Thorn, George Widmer**, M D Peter Bent Brigham Hospital, Boston, Mass *Prof of Medicine, Harvard Univ* (1, 1939)
- Thorp, W T S**, D V M, M S Natl Insts of Health, Bethesda, Md *Chief, Section on Comparative Pathology and Hematology* (4, 1948)
- Tidwell, Herbert C**, Ph D Southwestern Med

- School, 2211 Oak Lawn Ave, Dallas, Tex *Prof and Chairman of Dept of Biochemistry* (2, 1948)
- Tillett, William S, M D New York Univ College of Medicine, Dept of Bacteriology, 477 First Ave, New York City *Prof of Medicine* (6, 1927)
- Tilt, Jennie, Ph D 1011 Lincoln Blvd, Santa Monica, Calif (5, 1939)
- Tipson, R Stuart, Ph D Mellon Inst of Industrial Research, Univ of Pittsburgh, Pittsburgh, Pa *Sr Fellow, Dept of Research in Pure Chemistry* (2, 1937)
- Tipton, Samuel R, Ph D Univ of Tennessee, Dept of Zoology, Knoxville *Prof of Zoology* (1, 1940)
- Tislow, Richard, M D Schering Corp, Bloomfield, N J *Dir of Biological Labs* (1, 1944, 3, 1950)
- Titus, Harry W, Ph D Lime Crest Research Lab, RFD 1, Newton, N J *Technical Counsellor and Dir of Nutritional Research* (2, 1929, 5, 1933)
- Tobias, Julian M, M D Univ of Chicago, Chicago, Ill *Instr in Physiology* (1, 1944)
- Tocantins, Leandro Maués, M D Jefferson Med College, Philadelphia, Pa *Assoc Prof of Medicine* (1, 1939)
- Todd, Wilbert R, Ph D Univ of Oregon Med School, Portland, Ore *Assoc Prof of Biochemistry* (2, 1948, 5, 1948)
- Todhunter, Elizabeth Neige, Ph D Univ of Alabama, University *Prof of Nutrition* (5, 1939)
- Toennies, Gerrit, Ph D Inst for Cancer Research and Lankenau Hospital Research Inst, Philadelphia 11, Pa *Head, Dept of General Biochemistry* (2, 1934)
- Tolle, Chester D, Ph D Federal Security Agency, Food and Drug Admin, Washington, D C *Sr Biochemist* (5, 1942)
- Toman, James E P, Ph D Abbott Laboratories, Pharmacological Labs, North Chicago, Ill (1, 1945, 3, 1950)
- Tomarelli, Rudolph M, Ph D Wyeth, Inc, Nutritional Div, Mason, Ingham County, Mich *Sr Nutritional Investigator* (2, 1950, 5, 1950)
- Tomlinson, Wray Joseph, M D 1017 E 4th Ave, Mitchell, S Dak *Chief of Labs, St Joseph and Methodist State Hospitals, Consulting Pathologist, St Johns Hospital, Huron* (4, 1945)
- Tompkins, Edna H, M D Cancer Research Inst, New England Deaconess Hospital, 195 Pilgrim Rd, Boston 15, Mass *Research Assoc* (4, 1941)
- Torda, Clara, Ph D, M D Cornell Univ Med College, New York City *Research Assoc in Pharmacology* (1, 1943, 3, 1944)
- Toth, Louis A, Ph D Louisiana State Univ School of Medicine, Dept of Physiology, New Orleans 13 *Assoc Prof of Physiology* (1, 1940)
- Totter, John R, Ph D Univ of Arkansas School of Medicine, Little Rock *Assoc Prof, Dept of Biochemistry* (2, 1946)
- Tourtellotte, Dee, D Sc Charles B Knox Gelatin Co, 4th and Erie Sts, Camden, N J *Head of Nutrition Lab* (5, 1935)
- Tower, Sarah Sheldon, M D, Ph D Johns Hopkins Univ, Baltimore, Md *Asst Prof of Psychiatry* (1, 1932)
- Trager, William, M D, Ph D Rockefeller Inst for Med Research, 66th and York Ave, New York City 21 *Associate* (4, 1947)
- Traub, Frederick B, M D 405 E 72nd St, New York City 28 *Assoc Bacteriologist, Jewish Hospital of Brooklyn* (6, 1946)
- Travell, Janet, M D Cornell Univ Med College, New York City *Asst Prof of Clin Pharmacology* (3, 1933)
- Travis, Lee Edward, Ph D Univ of Southern California, Los Angeles *Prof of Psychology and Dir of Psychological Center, Major, YAAF (Yuma, Ariz)* (1, 1929)
- Treadwell, Carleton R, Ph D George Washington Univ School of Medicine, Dept of Biochemistry, 1335 H St, N W, Washington, D C *Assoc Prof of Biochemistry* (2, 1944, 5, 1949)
- Treffers, Henry P, Ph D Yale Med School, Dept of Immunology, New Haven, Conn *Assoc Prof of Immuno-chemistry* (6, 1942)
- Trimble, Harry C, Ph D Harvard Med School, 25 Shattuck St, Boston, Mass *Asst Prof of Biological Chemistry* (2, 1929, 5, 1936)
- Turnit, Hans Joachim, M D Med Div, Army Chemical Center, Md *Research Biophysicist* (1, 1950)
- Tuba, Jules, Ph D Univ of Alberta, Dept of Biochemistry, Edmonton, Alberta, Canada *Assoc Prof* (2, 1950)
- Tuft, Louis H, M D 1530 Locust St, Philadelphia, Pa *Asst Prof of Medicine, Temple Univ Med School, Chief of Clinic of Allergy and Applied Immunology, Temple Univ Hospital* (6, 1928)
- tum Suden, Caroline, Ph D Med Div, Toxicology, Army Chemical Center, Md (1, 1936)
- Tunturi, Archie Robert, Ph D Univ of Oregon Med School, Portland *Asst Prof of Anatomy* (1, 1946)
- Tuohy, Edward B, M S, M D Georgetown Univ Hospital, 3800 Reservoir Rd, Washington, D C *Prof of Anesthesiology* (3, 1941)
- Turner, Abby H, Ph D Mount Holyoke College, South Hadley, Mass *Prof of Physiology* (1R, 1928)
- Tuttle, Waid Wright, Ph D State Univ of Iowa, Iowa City *Prof of Physiology* (1, 1925)
- Tweedy, Wilbur R, Ph D Veterans Admin Hospital, Radioisotope Unit, Hines, Ill *Assoc Director* (2, 1931)
- Tyler, Albert, Ph D California Inst of Tech-

- nology, Pasadena, Calif *Assoc Prof of Embryology* (6, 1946)
- Tytell, Alfred A, Ph D Univ of Cincinnati College of Medicine, Eden and Bethesda Aves Cincinnati 19, Ohio *Asst Prof of Biological Chemistry* (6, 1950)
- Tyler, David B, Ph D Carnegie Inst of Washington, Dept of Embryology, Wolfe and Madison Sts, Baltimore 5, Md *Member of Staff* (1, 1943)
- Udenfriend, Sidney, Ph D Natl Insts of Health, Natl Heart Inst, Dept of Chemical Pharmacology, Bethesda 14, Md *Biochemist* (2, 1950)
- Umbreit, Wayne W, Ph D Merck Inst for Therapeutic Research, Rahway, N J *Asst Dir* (2, 1947)
- Ungar, Georges, M D, D Sc Rheumatic Fever Research Inst, 3026 S California Ave, Chicago 8, Ill *Research Assoc* (1, 1950)
- Unna, Klaus R W, M D Univ of Illinois College of Medicine, 1853 W Polk St, Chicago 12, Ill *Assoc Prof, Dept of Pharmacology* (1, 1941, 3, 1944, 5, 1942)
- Upton, Morgan, Ph D Rutgers Univ, Dept of Psychology, New Brunswick, N J (1, 1934)
- Urban, Frank, Ph D, M D 302 Northern Bldg, Green Bay, Wis *Physician and Surgeon* (2, 1932)
- Utter, Merton F, Ph D Western Reserve Univ, Dept of Biochemistry, Cleveland, Ohio *Assoc Prof of Physiological Chemistry* (2, 1946)
- Vahlteich, Ella McCollum, Ph D 310 Walnut St, Englewood, N J (5, 1933)
- Valle, J R, M D Escola Paulista de Medicina, Caixa Postal 144-A, Sao Paulo, Brazil *Prof of Pharmacology* (3, 1947)
- Vander Brook, Milton J, Ph D The Upjohn Co, Kalamazoo 99, Mich *Pharmacologist* (3, 1950)
- Vanderscheer, James, Ch E 136 Linwood Ave, Ridgewood, N J *Research Chemist, Lederle Labs* (6, 1946)
- Van Dyke, H B, Ph D, M D Columbia Univ College of Physicians and Surgeons, 630 W 168th St New York City 32 *Hosack Prof of Pharmacology* (1, 1925, 3, 1927)
- van Harrevelt, Anthonie, M A, M D California Inst of Technology, Pasadena *Prof of Physiology* (1, 1941)
- Van Liere, Edward J, M D, Ph D West Virginia Univ School of Medicine, Morgantown *Prof of Physiology and Dean* (1, 1927)
- Van Middlesworth, Lester, Ph D Univ of Tennessee, Memphis *Instr in Physiology* (1, 1948)
- Van Slyke, Donald D, Ph D, M D Brookhaven Natl Lab, Upton, L I, N Y *Asst Dir, Depts of Biology and Med Sciences, Member Emeritus, Rockefeller Inst* (2, 1908)
- van Wagenen, Gertrude, Ph D Yale Univ School of Medicine, New Haven, Conn *Assoc Prof* (1, 1932)
- van Wagtendonk, Willem J, Ph D Indiana Univ Dept of Zoology, Bloomington *Assoc Prof* (2, 1946)
- Van Winkle, Walton, Jr, M D American Med Assoc, 535 N Dearborn St, Chicago 10, Ill *Sec'y, Therapeutic Trials Committee* (3, 1939)
- Varney, Philip L Washington Univ School of Medicine, St Louis, Mo *Asst Prof of Bacteriology* (6, 1948)
- Vars, Harry M, Ph D Univ of Pennsylvania Med School, Harrison Dept of Surgical Research, Philadelphia *Assoc Prof of Physiological Chemistry* (2, 1935, 5, 1935)
- Velick, Sidney Frederick Washington Univ School of Medicine, Dept of Biochemistry, Euclid Ave and Kingshighway, St Louis 10, Mo *Asst Prof of Biochemistry* (2, 1946)
- Vennesland, Birgit, Ph D Univ of Chicago, Dept of Biochemistry, Chicago, Ill *Assoc Prof* (2, 1944)
- Venning, Eleanor H., Ph D Univ Clinic, Royal Victoria Hospital, Pine Ave, Montreal, Quebec, Canada *Asst Prof of Medicine, McGill Univ* (2, 1938)
- Vestling, Carl Swensson, Ph D Univ of Illinois, Noyes Lab, Urbana, Ill *Asst Prof of Biochemistry* (2, 1946)
- Vickery, Hubert B, Ph D Connecticut Agric Exper Station, New Haven *Biochemist in Charge, Dept of Biochemistry, Lecturer in Physiological Chemistry, Yale Univ* (2, 1923)
- Victor, Joseph, M D Camp Detrick, Frederick, Md *Chief, Pathology Branch* (4, 1935)
- Villee, Claude A, Jr, Ph D Harvard Med School, 25 Shattuck St, Boston 15, Mass *Asst Prof of Biological Chemistry* (2, 1948)
- Virtue Robert W, Ph D, M D Denver General Hospital, Denver 4, Colo *Anesthesiologist* (2, 1939)
- Visscher, Frank E, Ph D Upjohn Co, Kalamazoo 99, Mich *Research Scientist, Dept of Pharmacology and Endocrinology* (1, 1947)
- Visscher, Maurice B, Ph D, M D Univ of Minnesota, Minneapolis *Prof and Head of Dept of Physiology* (1, 1927)
- Voegtlin, Carl, Ph D Univ of Rochester Med School, Rochester, N Y *Lecturer in Pharmacology* (1R, 1908, 2, 1908, 3, 1908)
- von Haam, Emmerich, M D Ohio State Univ, Columbus *Prof of Pathology* (4, 1938)
- Von Oettingen, W F, M D, Ph D Natl Insts of Health, Lab of Physical Biology, Exper Biology and Medicine Inst, Bethesda, Md *Med Officer, Toxicology* (3, 1925)
- Voris, LeRoy, Ph D Natl Research Council, 2101 Constitution Ave, Washington 25, D C *Exec Sec, Food and Nutrition Board* (5, 1949)
- Vorwald, Arthur J, Ph D, M D Saranac Lake,

- N Y Dir, Edward L Trudeau Foundation and Saranac Lab (4, 1937)
- Vos, Bert J, Ph D, M D Food and Drug Admin, Div of Pharmacology, Washington, D C Pharmacologist (3, 1941)
- Wachstein, Max, M D St Catherine's Hospital, Brooklyn, N Y Dir of Lab, Research Asst, Mt Sinai Hospital (4, 1947)
- Waddell, James, Ph D E I duPont de Nemours & Co, New Brunswick, N J Dir of Biological Lab (2, 1930, 5, 1935)
- Wadsworth, Augustus B, M D Manchester, Vt (4, 1935, 6, 1920)
- Waelsch, Heinrich, M D, Ph D 722 West 168th St, New York City 32 Assoc Research Biochemist, N Y State Psychiatric Inst and Hospital, Assoc Prof of Biochemistry, Columbia Univ (2, 1941)
- Wagman, Irving H, Ph D Jefferson Med College, Dept of Physiology, Philadelphia 7, Pa Asst Prof of Physiology (1, 1946)
- Wainio, Walter W, Ph D Rutgers Univ, Bureau of Biological Research, Box 515, New Brunswick, N J Assoc Research Specialist (2, 1950)
- Waisman, Harry A, M D, Ph D Univ of Illinois Med School, 1819 W Polk St, Chicago 12 Asst Prof of Pediatrics (2, 1944)
- Wakeman, Alfred J, Ph D Hatfield Hill Rd, Bethany, Conn Retired (2, 1906)
- Wakerlin, George E, Ph D, M D Univ of Illinois Med School, 1853 W Polk St, Chicago Prof and Head of Dept of Physiology (1, 1933, 3, 1934)
- Wakim, Khalil G, M D, Ph D Mayo Clinic, Rochester, Minn Consultant, Prof of Physiology, Mayo Foundation (1, 1942)
- Waksman, Byron H, M D 52 Phillips St, Boston 14, Mass Research Fellow, Massachusetts General Hospital, Teaching appointment, Harvard Med School (6, 1950)
- Walcott, William W, Ph D Columbia Univ College of Physicians and Surgeons, Dept of Physiology, New York City 32 Instructor (1, 1947)
- Wald, George, Ph D Harvard Univ, Biological Labs, Cambridge, Mass (1, 1934, 2, 1950)
- Walker, A Earl, M D 601 N Broadway, Baltimore 5, Md Prof of Neural Surgery, The Johns Hopkins Univ (1, 1950)
- Walker, Arthur M, M D Veterans Admin, Washington 25, D C (1, 1932, 3, 1939)
- Walker, Burnham S, Ph D, M D Boston Univ School of Medicine, 80 E Concord St, Boston, Mass Prof of Biochemistry (2, 1940)
- Walker, Ernest Linwood, Sc D 50 Winchester Dr, Menlo Pk, Calif (3R, 1931)
- Walker, Harry A, Ph D Emory Univ School of Medicine, Emory University, Ga Asst Prof of Pharmacology (3, 1948)
- Walker, Sheppard M, Ph D Univ of Louisville School of Medicine, 101 W Chestnut St, Louisville, Ky Asst Prof of Physiology (1, 1946)
- Wallen-Lawrence, Zonja, Ph D 4534 W Pine Blvd, St Louis 8, Mo (2, 1937)
- Walter, Annabel W 29 Perry St, New York City 14 Bacteriologist, New York City Dept of Health, Bureau of Labs (6, 1946)
- Walter, Carl W, M D Harvard Med School, 25 Shattuck Street, Boston, Mass Asst Clin Prof of Surgery, Sr Assoc in Surgery, Peter Bent Brigham Hosp (4, 1942)
- Walters, Orville S, Ph D, M D McPherson, Kan Physician (1, 1936)
- Walton, Robert P, Ph D, M D Med College of the State of South Carolina, Charleston Prof of Pharmacology (3, 1933)
- Walton, Seth T, V M D, Ph D Lab, Veterans Hospital, Oteen, N C Dir of Labs and Research (6, 1936)
- Walzer, Matthew, M D 20 Plaza St, Brooklyn, N Y Attending in Allergy, Jewish Hospital of Brooklyn (6, 1924)
- Wang, Chi Che, Ph D U S Veterans Admin Hospital, Hines, Ill Research Biochemist in charge of Metabolic Lab, Assoc Prof of Dept of Exper Medicine, Northwestern Univ Med School, Chicago, Ill (2, 1922, 5, 1933)
- Wang, Shih-Chun, M D, Ph D Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City 32 Assoc Prof of Physiology (1, 1943)
- Wangeman, Clayton P, M D Broadway Med Center, Associated Anesthesiologists, Seattle, Washington (3, 1946)
- Wangensteen, Owen Harding, M D Univ Hospital, Minneapolis 14, Minn Prof of Surgery, Univ of Minnesota (1, 1947, 4, 1931)
- Ward, Arthur A, Jr, M D Univ of Washington, School of Medicine, Div of Neurosurgery, Seattle Asst Prof of Surgery, Head of Div (1, 1949)
- Ward, Walter E, Ph D, M D Cutter Labs Fourth and Parker Sts, Berkeley 1, Calif Assoc Med Dir (6, 1947)
- Ware, Arnold G, Ph D Los Angeles County Hospital, Main Lab, 1200 N State St, Los Angeles 33, Calif Head Chemist, Asst Prof of Biochemistry, Univ of Southern California (2, 1949)
- Warner, Emory D, M D Med Labs Bldg, Iowa City, Ia Prof of Pathology (4, 1937)
- Warner, Robert C, Ph D New York Univ College of Medicine, 477 First Ave, New York City 16 Asst Prof of Chemistry (2, 1946)
- Warren, James V, M D Emory Univ School of Medicine, Atlanta, Ga Prof of Physiology, Assoc Prof of Medicine (1, 1947)
- Warren, Joel 7415 Lannhurst St, Chevy Chase, Md Chief, Virus Research Section, Army Med Dept Research and Grad School (6, 1949)

- Warren, Marshall R, Ph D Univ of Tennessee College of Medicine, Memphis *Assoc Prof of Pharmacology* (3, 1948)
- Warren, Shields, M D 195 Pilgrim Rd, Boston, Mass *Prof of Pathology, Harvard Med School, Dir, Div of Biology and Medicine, USAEC* (4, 1929)
- Wartman, William Bechmann, M D Northwestern Univ, 303 East Chicago Ave, Chicago 11, Ill *Morrison Prof and Chairman of Dept of Pathology* (4, 1940)
- Wasteneys, Hardolph, Ph D Univ of Toronto, Toronto, Ontario, Canada *Prof and Head of Dept of Biochemistry* (2, 1915)
- Waterman, Robert E, B S Schering Corp, 86 Orange St, Bloomfield, N J *Vice-Pres* (2, 1940)
- Waters, Ralph Milton, M D R R #3, Box 456, Orlando, Fla (3, 1937)
- Watson, Cecil J, M D, Ph D University Hospital, Dept of Medicine, Minneapolis, Minn *Prof and Head of Dept of Medicine* (4, 1941)
- Watson, Dennis W Univ of Minnesota Med School, Dept of Bacteriology and Immunology, Minneapolis *Assoc Prof* (6, 1949)
- Watson, John B, Ph D Box 526, Westport, Conn (1, 1907)
- Watts, Daniel T, Ph D Univ of Virginia Med School, Dept of Pharmacology, Charlottesville *Assoc Prof of Pharmacology* (3, 1950)
- Waud, Russell A, M D, Ph D Univ of Western Ontario Med School, London, Ontario, Canada *Prof and Head of Dept of Pharmacology* (3, 1931)
- Waugh, David F, Ph D Massachusetts Inst of Technology, Dept of Biology and Biological Engineering, Cambridge *Asst Prof of Physical Biology* (1, 1943)
- Way, E Leong, Ph D Univ of California Med Center, San Francisco, Calif *Asst Prof of Pharmacology* (3, 1947)
- Wearn, Joseph T, M D Lakeside Hospital, Cleveland Ohio *Dir of Medicine, Prof of Medicine, Western Reserve Univ* (1, 1921)
- Weatherby, J H, Ph D Med College of Virginia, Dept of Physiology and Pharmacology, Richmond, Va *Assoc Prof of Pharmacology* (3, 1941)
- Weber, Clarence J, M D, Ph D 5641 Tahoe Lane, Kansas City 3, Kans *Chief, Lab Service, V A Hospital, Wadsworth* (2, 1931)
- Webster, Bruce, M D, C M Cornell Univ Med College, 1300 York Ave, New York City *Asst Prof of Medicine, Assoc Attending Physician, New York Hospital* (5, 1935)
- Weed, Lewis H, M D, Ph D Natl Research Council, 2101 Constitution Ave, Washington, D C (1R, 1919)
- Wégria, René, M D Presbyterian Hospital, Dept of Medicine, 622 W 168th St, New York City *Asst Prof of Medicine* (1, 1941, 3, 1950)
- Weichert, Charles K, Ph D Univ of Cincinnati, Cincinnati, Ohio *Prof of Zoology* (1, 1935)
- Weichselbaum, Theodore E, Ph D Washington Univ School of Medicine, Dept of Surgery, 4580 Scott Ave, St Louis 10, Mo *Research Assoc* (2, 1950)
- Weil, Alfred J, M D The Bronx Hospital, New York City *Dir of Dept of Bacteriology* (6, 1940)
- Weil, Arthur, M D 952 5th Ave, New York City (4, 1940)
- Weil, Leopold, Ph D U S Dept of Agriculture, Eastern Regional Research Lab, Chestnut Hill Station, Philadelphia 18, Pa *Chemist* (2, 1942)
- Weil, Marvin Lee, M D Army Med Dept Research and Grad School, Army Med Center, Washington, D C *Captain, Med Corps* (6, 1950)
- Weinhouse, Sidney, Ph D Lankenau Hospital Research Inst, Fox Chase, Philadelphia 11, Pa *Head, Metabolic Chemistry* (2, 1948)
- Weir, Everett G, Ph D 231 S 13th Ave, Maywood, Ill (1, 1941)
- Weiser, Russell S, Ph D Univ of Washington School of Medicine, Seattle 5, Washington *Assoc Prof of Microbiology* (6, 1948)
- Weiss, Charles, Ph D, M D Jewish Hospital, York and Tabor Rds, Philadelphia, Pa *Dir of Labs* (4, 1934, 6, 1920)
- Weiss, Emil, M D, Ph D 5036 Bernard St, Chicago, Ill *Pathologist, People's Hospital* (6, 1927)
- Weiss, Paul, Ph D Univ of Chicago, Chicago, Ill *Prof of Zoology* (1, 1936)
- Welch, Arnold D, Ph D, M D Western Reserve Univ School of Medicine, Cleveland, Ohio *Prof and Dir of Dept of Pharmacology* (2, 1950, 3, 1942, 5, 1944)
- Welch, Henry, Ph D U S Food and Drug Admin, Rm 6171 S Agriculture Bldg, Washington, D C, *Chief of Div of Penicillin Control and Immunology* (6, 1932)
- Weld, Charles Beecher, M A, M D Dalhousie Univ, Halifax, N S, Canada *Prof of Physiology* (1, 1936)
- Weld, Mrs Julia T Columbia Univ College of Physicians and Surgeons, 630 W 168th St, New York City *Research Assoc in Pathology* (6, 1920)
- Welker, William H, Ph D 534 N Elmwood Ave, Oak Park, Ill *Prof Emeritus of Biological Chemistry, Univ of Illinois College of Medicine* (2, 1906)
- Weller, Carl Vernon, M D 1130 Fair Oaks Parkway, Ann Arbor, Mich *Prof and Chairman of Dept of Pathology, Univ of Michigan* (4, 1923)

- Wells, Herbert S , M D Univ of Minnesota, Minneapolis 14 *Prof of Clin Physiology* (1, 1932)
- Wells, Joseph Albert, M D , Ph D Northwestern Univ Med School, Chicago, Ill *Assoc Prof of Pharmacology* (3, 1944)
- Welsh, John H , Ph D Harvard Univ , Biological Labs , 16 Divinity Ave , Cambridge 38, Mass *Assoc Prof of Zoology* (1, 1945)
- Wendel, William B , Ph D Tulane Univ School of Medicine, 6501 St Charles Ave , New Orleans 15, La *Prof and Head of Dept of Biochemistry* (2, 1932)
- Werber, Erna A , Ph D 44 W 83rd St , New York City *Dir of Research Lab , Jewish Hospital of Brooklyn* (6, 1948)
- Werkman, C H , Ph D Iowa State College, Science Hall, Ames *Prof and Head of Dept of Bacteriology* (2, 1942)
- Werle, Jacob M , M D 2000 W 25th St , Cleveland 13, Ohio *Surgeon* (1, 1943)
- Werner, Harold W , Ph D The Wm S Merrell Co , Lockland Station, Cincinnati, Ohio *Dir Pharmacology Research* (3, 1942)
- Wertenberger, Grace E , Ph D Univ of Indiana, Dept of Physiology, Bloomington (1, 1943)
- Werthessen, Nicholas T , Ph D Shrewsbury, Mass Worcester Foundation for Exper Biology *Sr Fellow* (1, 1946)
- Wertz, Anne W , Ph D Univ of Massachusetts, Nutrition Research Labs , Home Economics Dept , Amherst *Prof , Research, Home Economics Nutrition* (5, 1950)
- Wescoe, W Clarke, M D Cornell Univ Med College, 1300 York Ave , New York City 21 *Asst Prof of Pharmacology* (3, 1949)
- Wesson, Laurence G , Ph D Forsyth Dental Infirmary, Boston, Mass *Research Biochemist* (2, 1929, 3, 1932)
- Wesson, Laurence G , Jr , Ph D New York Univ College of Medicine, Dept of Physiology, New York City 16 *Asst Prof* (1, 1949)
- West, Edward S , Ph D Univ of Oregon Med School, Portland *Prof of Biochemistry* (2, 1925)
- West, Harold D , Ph D Meharry Med College, Nashville 8, Tenn *Prof and Head of Dept of Biochemistry* (2, 1946)
- Westerfeld, Wilfred Wiedey, Ph D State Univ of New York, Med Center at Syracuse Univ , Syracuse 10, N Y *Prof of Biochemistry* (2, 1944)
- Westfall, B A , Ph D Univ of Missouri School of Medicine, Dept of Physiology and Pharmacology, Columbia *Prof of Pharmacology* (1, 1949, 3, 1950)
- Weston, Raymond E , M D , Ph D Montefiore Hospital, Med Div , New York City 67 *Asst in Medicine* (1, 1947)
- Weymouth, Frank W , Ph D Stanford Univ , Calif *Prof and Exec of Dept of Physiology* (1R, 1917)
- Wheeler, Albert H , M S , M S P H , Dr P H Univ of Michigan Hospital, Serology Lab , Ann Arbor *Research Assoc* (6, 1950)
- Wheeler, George W , M D New York Hospital, 525 E 68th St , New York City *Asst Dir* (6, 1920)
- Wheeler, Mary W , M A New York State Dept of Health, Div of Labs and Research, Albany *Assoc Bacteriologist* (6, 1933)
- Wheelon, Homer, M S , M D Univ of Washington, Seattle, Wash *Prof of Medicine* (1, 1919)
- Whipple, George H , M D , Sc D Univ of Rochester, Rochester, N Y *Prof of Pathology and Dean of School of Medicine and Dentistry* (1, 1911, 4, 1913)
- White, Abraham, Ph D Univ of California School of Medicine, Los Angeles 24 *Prof and Chairman of Dept of Physiological Chemistry* (2, 1934, 5, 1937)
- White, Alan G C , Ph D Tulane Univ , Dept of Biochemistry, New Orleans, La *Asst Prof of Biochemistry* (2, 1949)
- White, Colin, B S Med School, Hospital Centre, Dept of Physiology, Birmingham 15, England (1, 1949)
- White, Florence R , Ph D % Dr Julius White, Natl Insts of Health, Natl Cancer Inst , Bethesda 14, Md *Biochemist* (2, 1946)
- White, Frank D , Ph D Univ of Manitoba, Faculty of Medicine, Bannatyne Ave , Winnipeg, Manitoba, Canada *Prof of Biochemistry, Biochemist, Winnipeg General Hospital* (2, 1931)
- White, Harvey Lester, M D Washington Univ Med School, St Louis 10, Mo *Prof of Physiology* (1, 1923)
- White, Julius, Ph D Natl Insts of Health, Natl Cancer Inst , Bethesda 14, Md *Head Chemist* (2, 1937)
- White, Paul Dudley, M D Massachusetts General Hospital, Boston, Mass *Physician (in charge of Cardiac Clinics and Lab), Lecturer in Medicine, Harvard Med School* (3, 1921)
- Whitehead, Richard W , M A , M D Univ of Colorado School of Medicine, 4200 E Ninth Ave , Denver *Prof of Physiology and Pharmacology* (1, 1933, 3, 1928)
- Whitehorn, William V , M D Univ of Illinois College of Medicine, Chicago *Asst Prof of Applied Physiology* (1, 1947)
- Whittenberger, James L , M D Harvard School of Public Health, Dept of Physiology, 55 Shattuck St , Boston 15, Mass *Asst Prof and Head of Dept of Physiology* (1, 1949)
- Wiener, Alexander S , M D 64 Rutland Rd Brooklyn, N Y *Bacteriologist and Serologist to Office of Chief Med Examiner of New York*

- City, Head of Transfusion Div, Jewish Hospital of Brooklyn* (6, 1932)
- Wiercinski, Floyd J**, Ph D Hahnemann Med College, 235 N 15th St, Philadelphia, Pa *Asst Prof in Physiology* (1, 1950)
- Wiersma, Cornelis A G**, Ph D California Inst of Technology, Pasadena *Assoc Prof of Physiology* (1, 1941)
- Wiese, Alvin C**, Ph D Univ of Idaho, Dept of Agricultural Chemistry, Moscow *Prof and Head of Dept* (5, 1950)
- Wiggers, Carl J**, M D, Sc D Western Reserve Univ Med School, Cleveland, Ohio *Prof and Dir of Physiology* (1, 1907, 3R, 1909)
- Wiggers, Harold C**, Ph D Union Univ, Albany Med College, Dept of Physiology and Pharmacology Albany 3, N Y *Prof and Chairman of Dept* (1, 1938)
- Wigodsky, Herman S**, Ph D, M D 420 E Houston St, San Antonio 5, Tex (1, 1943)
- Wikler, Abraham**, M D USPHS Hospital, Lexington, Ky *Sr Surgeon (R)* (3, 1944)
- Wilber, Charles G**, Ph D St Louis Univ, 1402 S Grand Blvd, St Louis 4, Mo *Dir of Biological Labs* (1, 1947)
- Wilde, Walter S**, Ph D Tulane Univ School of Medicine, Station 20, New Orleans, La *Assoc Prof of Physiology* (1, 1944)
- Wilder, Russell M**, Ph D, M D Mayo Clinic, Rochester, Minn *Prof of Medicine, Mayo Foundation, Univ of Minnesota* (1, 1921, 4R, 1924, 5, 1933)
- Wiley, Frank H**, Ph D Federal Security Agency, Food and Drug Admin, Washington 25, D C *Chief Div of Pharmaceutical Chemistry* (2, 1933)
- Wilhelmi, Alfred E**, Ph D Emory Univ School of Medicine, Emory Univ, Ga *Prof of Biochemistry* (2, 1942)
- Wilhelmj, Charles Martel**, M D Creighton Univ School of Medicine, Omaha, Neb *Prof of Physiology* (1, 1931)
- Wilkerson, Vernon A**, M D, Ph D Med Arts Bldg, 61 K St, N W, Washington, D C *Biochemical Consultant* (2, 1936)
- Williams, Carroll M**, Ph D, M D Harvard Univ, Biological Labs, Cambridge, Mass *Asst Prof of Zoology* (1, 1947)
- Williams, Harold H**, Ph D Cornell Univ, Fernow Hall, Ithaca, N Y *Prof of Biochemistry* (2, 1938, 5, 1936)
- Williams, Horatio B**, M D, Sc D Box 893, Greenwich, Conn *Dalton Prof Emeritus of Physiology, Columbia Univ* (1, 1912)
- Williams, J W**, Ph D Univ of Wisconsin, Chemistry Bldg, Madison *Prof of Chemistry* (2, 1944)
- Williams, Ray D**, M S, M D 6834 Waterman St, St Louis, Mo *Asst Prof of Clin Medicine, Washington Univ* (5, 1941)
- Williams, Robert Hardin**, M D Univ of Washington, Dept of Medicine, Seattle *Prof and Exec Officer* (4, 1940)
- Williams, Robert R**, D Sc 297 Summit Ave, Summit, N J *Dir of Grants, Research Corp* (2, 1919, 5, 1941)
- Williams, Roger J**, Ph D Univ of Texas, Dept of Chemistry, Austin *Prof of Chemistry, Dir of Biochemical Inst* (2, 1931)
- Williams, W Lane**, Ph D Univ of Minnesota Med School, Minneapolis 14 *Assoc Prof of Anatomy* (1, 4, 1947)
- Wills, J H**, Ph D Med Div, Pharmacology Section, Army Chemical Center, Md (1, 1943)
- Wilson, Armine T Alfred I DuPont Inst**, Wilmington 99, Del *Chief Bacteriologist, Pediatrician-in-Chief* (6, 1949)
- Wilson, David Wright**, Ph D Univ of Pennsylvania Med School, Philadelphia *Benjamin Rush Prof of Physiological Chemistry* (1, 1915, 2, 1915)
- Wilson, Eva D**, Ph D 256 E Irvin Ave, State College, Pa (5, 1947)
- Wilson, Frank N**, M D Univ Hospital, Ann Arbor, Mich *Prof of Medicine, Univ of Michigan* (4, 1925)
- Wilson, J Walter**, Ph D Brown Univ, Dept of Biology, Providence 12, R I *Chairman of Dept of Biology, F L Day Prof of Biology* (1, 1949, 4, 1950)
- Wilson, John W**, Ph D Wright-Patterson Air Force, Aero-Med Lab, Dayton, Ohio *Research Physiologist* (1, 1948)
- Wilson, Karl M**, M D Univ of Rochester School of Medicine, Rochester, N Y *Prof of Obstetrics and Gynecology* (4, 1927)
- Wilson, P W**, Ph D Univ of Wisconsin, Dept of Agricultural Bacteriology, Madison *Prof of Agricultural Bacteriology* (2, 1939)
- Wilson, Robert H**, Ph D U S Dept of Agriculture, Western Regional Research Lab, 800 Buchanan St, Albany, Calif *Sr Pharmacologist* (3, 1937)
- Winder, Claude V**, Sc D Parke Davis and Co, Detroit, Mich *Research Pharmacologist* (1, 1938, 3, 1948)
- Windle, William Frederick**, Ph D Univ of Pennsylvania Med School, Philadelphia *Prof of Anatomy* (1, 1937)
- Winkenwerder, Walter LaF**, M D 1014 St Paul St, Baltimore, Md *Assoc in Medicine, Johns Hopkins Med School* (6, 1938)
- Winnick, Theodore**, Ph D Univ of Iowa Med School, Iowa City *Assoc Prof of Biochemistry, Radiation Research Lab* (2, 1946)
- Winter, Charles A**, Ph D Merck Inst for Therapeutic Research, Rahway, N J *Research Assoc* (1, 1940)
- Winter, Irwin Clinton**, Ph D, M D G D Searle

- and Co , P O Box 5110, Chicago 80, Ill *Dir of Clin Research* (3, 1941)
- Winternitz, M C , M D Natl Research Council, 2101 Constitution Ave , Washington 25, D C *Chairman, Div of Med Sciences* (4, 1913)
- Wintersteiner, Oskar, Ph D Squibb Inst for Med Research, New Brunswick, N J *Member, Head, Div of Organic Chemistry* (2, 1930)
- Wintrobe, Maxwell Myer, M D , Ph D 175 E 21st St , S , Salt Lake City 15, Utah *Prof and Head, Dept of Internal Medicine, Univ of Utah College of Medicine, Physician-in-Chief, Salt Lake County General Hospital* (4, 1940)
- Winzler, Richard J , Ph D Univ of Southern California Med School, Dept of Biochemistry, Los Angeles 7 *Professor* (2, 1946)
- Wiseman, Bruce Kenneth, M D Ohio State Univ , Kinsman Hall, Columbus *Prof and Chairman of Dept of Medicine, Asst Dir of Med Research* (4, 1932)
- Wislocki, George B , M D Harvard Univ Med School, 25 Shattuck St , Boston, Mass *Parkman Prof of Anatomy* (1, 1924)
- Wissler, Robert W , M D , Ph D Albert Merritt Billings Hospital, 950 E 59th St , Chicago 37, Ill *Asst Prof of Pathology, Univ of Chicago* (4, 1949)
- Witebsky, Ernest, M D Buffalo General Hospital, 100 High St , Buffalo, N Y *Prof and Head of Dept of Bacteriology and Immunology* (6, 1935)
- Witlich, Fred W , M D 401 LaSalle Med Bldg , Minneapolis 2, Minn *Sec-Treas of American College of Allergists, Chairman of Exec Committee, International Assoc of Allergists* (6, 1944)
- Wolbach, S Burt, M D Children's Hospital, Boston, Mass *Shattuck Prof Emeritus of Pathological Anatomy, Harvard Med School, Dir of Nutritional Research, Children's Hospital* (4, prior to 1920)
- Wolf, Abner, M D Columbia Univ College of Physicians and Surgeons, New York City 32 *Assoc Prof of Neuropathology* (4, 1948)
- Wolf, Arnold Veryl, Ph D Union Univ , Albany Med College, Albany, N Y *Assoc Prof of Physiology* (1, 1946)
- Wolf, Stewart, M D Cornell Univ Med College, New York City *Asst Prof of Medicine* (1, 1948)
- Wolff, Harold G , M D , M A New York Hospital, 525 E 68th St , New York City *Assoc Prof of Medicine, Cornell Univ Med College, Assoc Attending Physician, New York Hospital* (1, 1930, 3, 1942)
- Wolff, William A , Ph D Wake Forest College, Bowman Gray School of Medicine, Winston-Salem 7, N C *Asst Prof of Biochemistry* (2, 1947)
- Womack, Madelyn, Ph D U S Dept of Agriculture, Agricultural Research Admin , Foods and Nutrition Div , Washington 25, D C *Biochemist* (5, 1947)
- Wood, Earl H , Ph D , M D Mayo Foundation, Rochester, Minn *Assoc Prof of Physiology, Grad School, Univ of Minnesota, Consultant in Physiology, Mayo Clinic* (1, 1943, 3, 1949)
- Wood, Harland G , Ph D Western Reserve Univ , Dept of Biochemistry, Cleveland 6, Ohio *Prof of Biochemistry* (2, 1944)
- Wood, Horatio C , Jr , M D , Ph M 319 S 41st St , Philadelphia 4, Pa *Prof of Pharmacology, Philadelphia College of Pharmacy and Science* (3R, 1908)
- Wood, John L , Ph D Univ of Tennessee School of Biological Sciences, 875 Monroe Ave , Memphis 3 *Assoc Prof of Chemistry* (2, 1947)
- Woodbury, Robert A , Ph D , M D Univ of Tennessee, Dept of Pharmacology, Memphis *Prof and Chief of Div of Pharmacology* (1, 1936, 3, 1941)
- Woods, Alan C , M D Johns Hopkins Hospital, Wilmer Ophthalmological Inst , Baltimore, Md *Dir of Inst and Ophthalmologist-in-Chief, Acting Prof of Ophthalmology, Johns Hopkins Univ* (6, 1918)
- Woods, Ella, Ph D Univ of Idaho, Moscow *Home Economist, Exper Station* (2, 1925, 5, 1933)
- Woods, Lauren A , M D , Ph D Univ of Michigan, Dept of Pharmacology, Ann Arbor *Asst Prof* (3, 1949)
- Woodward, Alvalyn E , Ph D Univ of Michigan, Ann Arbor *Asst Prof of Zoology* (1, 1932)
- Woodyatt, Rollin T , M D 237 E Delaware Place, Chicago, Ill *Prof of Medicine, Rush Med College, Univ of Chicago* (2, 1912)
- Wooley, Jerald G Natl Insts of Health, Exper Biology and Medicine Inst , Bethesda, Md *Sr Biologist* (6, 1949)
- Woolley, D Wayne, Ph D Rockefeller Inst for Med Research, 66th St and York Ave , New York City *Member* (2, 1946, 5, 1941)
- Woolpert, Oram C , M D , Ph D Camp Detrick, Frederick, Md *Tech Dir of Biological Div , Chemical Corps* (6, 1947)
- Woolsey, Clinton N , M D Univ of Wisconsin, Service Memorial Insts , Madison *Charles Sumner Slichter Research Prof of Neurophysiology* (1, 1938)
- Wortis, S Bernard, M D New York Univ College of Medicine, Dept of Psychiatry, New York City 16 *Prof and Chairman of Dept of Psychiatry, Dir of Psychiatric Div of Bellevue Hospital* (1, 1947)
- Wright, Angus, M D Univ of Southern California Med School, 657 S Westlake Ave , Los Angeles *Pathologist, California Hospital* (4, 1935)
- Wright, Arthur W , M D Albany Med College, New Scotland Ave , Albany, N Y *Prof of Pathology and Bacteriology* (4, 1941)

- Wright, Charles Ingham, Ph D Natl Insts of Health, Bethesda, Md *Sr Pharmacologist, USPHS* (1, 1935, 3, 1936)
- Wright, George G, Ph D Camp Detrick, Frederick, Md *Chief, Special Procedures Branch, S-Div* (6, 1943)
- Wright, Harold N, Ph D Univ of Minnesota, Minneapolis *Prof of Pharmacology* (3, 1931)
- Wright, Lemuel D, Ph D Sharp and Dohme, Inc, Med Research Div, Glenolden, Pa, *Dir of Nutritional Research* (2, 1946, 5, 1946)
- Wright, Paul A, Ph D Univ of Michigan, Dept of Zoology, Ann Arbor *Asst Prof* (1, 1950)
- Wright, Sydney L, Ph D Endsmeet Farm, Wyncote, Pa (2, 1933)
- Wu, Hsein, Ph D Med College of Alabama, Birmingham 5 *Visiting Prof of Biochemistry* (2, 1950)
- Wulff, V J, Ph D Univ of Illinois, Dept of Zoology and Physiology, Urbana *Asst Prof of Physiology, Special Research Asst* (1, 1949)
- Wulzen, Rosalind, Ph D Oregon State College, Corvallis *Asst Prof of Zoology* (1R, 1916)
- Wyckoff, Ralph W G, Ph D USPHS, Natl Insts of Health, Bethesda, Md *Sr Scientist* (6, 1940)
- Wyman, Jeffries, Jr, Ph D Harvard Univ, Biological Labs, Cambridge, Mass *Assoc Prof of Zoology* (1, 1928)
- Wyman, Leland C, Ph D Boston Univ, College of Liberal Arts, 675 Commonwealth Ave, Boston, Mass *Prof of Biology* (1, 1927)
- Wynne, Arthur M, Ph D Univ of Toronto, Dept of Biochemistry, Toronto, Ontario, Canada *Prof of Biochemistry* (2, 1940)
- Yager, Robert H, V.M.C. Army Med Dept Research and Grad School, Army Med Center, Washington 12, D C *Lt Col, Dir, Veterinary Div* (6, 1950)
- Yerkes, Robert M, Ph D Yale Univ School of Medicine, New Haven, Conn *Prof Emeritus of Psychobiology, Yale Univ* (1R, 1904)
- Yonkman, Frederick F, Ph D, M D Ciba Pharmaceutical Products, Inc, Summit, N J *Dir of Research at Ciba, Lecturer in Pharmacology, Columbia Univ College of Physicians and Surgeons* (3, 1931)
- Youmans, John B, M D Vanderbilt Univ School of Medicine, Nashville, Tenn *Dean* (5, 1948)
- Youmans, William Barton, Ph D, M D Univ of Oregon Med School, Portland *Prof of Physiology* (1, 1939, 3, 1949)
- Young, A G, Ph D, M D 520 Commonwealth Ave, Boston, Mass *Asst Prof of Therapeutics, Boston Univ School of Medicine, Med Dir of Corey Hill Hospital, Brookline* (3, 1925)
- Young, E G, Ph D Natl Research Council of Canada, Maritime Regional Lab, Halifax, N S *Director* (2, 1925)
- Youngburg, Guy E, Ph D Route 2, Box 268 Mesa, Ariz *Emeritus* (2, 1927)
- Youngner, Julius Stuart, M S, Sc.D Univ of Pittsburgh, School of Medicine, Virus Research Lab, Pittsburgh, Pa *Asst Research Prof of Bacteriology* (6, 1950)
- Yuile, Charles L, M D, C M Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Assoc Prof of Pathology* (4, 1941)
- Zamecnik, Paul, M D Massachusetts General Hospital, Fruit St, Boston 14, Mass *Asst Prof of Medicine and Tutor in Biochemical Sciences, Harvard Univ* (2, 1950)
- Zapp, John A, Jr, Ph D 916 Harper Ave, Drexel Hill, Pa *Asst Dir, Haskell Lab of Industrial Toxicology, E I duPont de Nemours & Co* (1, 1950)
- Zarrow, M X, Ph D Purdue Univ, Dept of Biological Sciences, Lafayette, Ind (1, 1949)
- Zechmeister, L, Dr Ing California Inst of Technology, Pasadena *Prof of Organic Chemistry* (2, 1941)
- Zeckwer, Iselde T, M D Univ of Pennsylvania School of Medicine, Philadelphia *Assoc Prof of Pathology* (1, 1934, 4, 1927)
- Zeidman, Irving, M D Univ of Pennsylvania School of Medicine, Dept of Pathology, Philadelphia *Associate* (4, 1949)
- Zeldis, Louis J, M D Brookhaven Natl Lab, Med Dept, Upton, Long Island, N Y *Pathologist, Div of Pathology and Brookhaven Natl Lab Hospital* (4, 1945)
- Zilversmit, D B, Ph D Univ of Tennessee, Dept of Physiology, Memphis 3 *Instructor* (1, 1949)
- Zimmerman, Harry M, M D Montefiore Hospital, Gun Hill Rd, New York City 67 *Chief, Lab Div, Prof of Pathology, College of Physicians and Surgeons, Columbia Univ* (4, 1933)
- Zirkle, Raymond E, Ph D Univ of Chicago, Chicago, Ill *Prof of Botany and Dir of Inst of Radiobiology and Biophysics* (1, 1948)
- Zittle, Charles A, Ph D U S Dept of Agriculture, Eastern Regional Research Lab, Philadelphia 18, Pa *Chemist, Protein Div* (2, 1946)
- Zucker, Marjorie B, Ph D New York Univ College of Dentistry, Dept of Physiology, 209 E 23rd St, New York City 10 (1, 1947)
- Zweifach, Benjamin W, Ph D New York Hospital and Cornell Univ Med College, Dept of Medicine, 525 E 68th St, New York City 21 *Asst Prof of Physiology* (1, 1945)
- Zwemer, Raymund L, Ph D 5003 Battery Lane, Bethesda 14, Md *Chief, Science Div, Library of Congress, Washington, D C* (1, 1930)

SUMMARY OF MEMBERSHIP

The American Physiological Society	1238
American Society of Biological Chemists	882
American Society for Pharmacology and Experimental Therapeutics	458
The American Society for Experimental Pathology	352
American Institute of Nutrition	357
The American Association of Immunologists	384
Total membership of Federation	3671

DECEASED MEMBERS

Babkin, B P (1, 1924) May 3, 1950	Kurotchkin, Timothy J (6, 1946) April 29, 1949
Baudisch, Oskar (2, 1931) March 28, 1950	Lehmann, Gerhard (3, 1939) November 1948
Bazett, Henry C (1, 1921) July 11, 1950	Munro, F L (2, 1948) April 8, 1950
Boivin, Andre (6, 1949) March 1, 1950	Murphy, James B (4, prior to 1920) August 24, 1950
Cope, Otis M (1, 1929) January 28, 1950	Pemberton, Ralph (5, 1933) June 1949
Emmett, Arthur D (2, 1908, 5, 1933) June 11, 1947	Perlzweig, William A (2, 1924, 5, 1944) December 10, 1949
Friedemann, Ulrich (6, 1938) November 15, 1949	Petersen, William F (4, 1923) August 21, 1950
Gray, Samuel H (4, 1939) August 18, 1949	Pohlman, Augustus G (1, 1934) March 31, 1950
Groat, William A (6, 1917) 1945	Reed, Howard S (2, 1909) May 12, 1950
Gutierrez-Noriega, Carlos (3, 1948) November 1950	Robbie, W A (1, 1947) September 7, 1949
Haythorn, Samuel R (4, 1925) December 6, 1949	Stillman, Ernest G (6, 1930) December 16, 1949
Hertz, Saul (4, 1935) August 2, 1950	Toomey, John A (6, 1943) January 1, 1950
Howe, Percy R (5, 1935) February 28, 1950

FEDERATION NOTICE

Regulations for Submission of Abstracts

1951 Annual Meeting—April 29–May 3

Cleveland, Ohio

The 35th Annual Convention of the Federation will be held in Cleveland, Ohio, April 29–May 3, 1951. The headquarters hotels will be the Statler (Physiology, Pharmacology, Pathology) and the Cleveland (Biochemistry, Nutrition, Immunology). Scientific sessions will be held in the Cleveland Public Auditorium.

Deadline for Abstracts, January 13, 1951 In order to have the abstracts of papers to be presented on the program published and distributed to all members and subscribers to Federation Proceedings in advance of the Annual Meeting, the date of January 13 has been set as the deadline for the submission of abstracts to the Society Secretaries. This applies to both members and non-members who wish to present papers at the scientific sessions. The following regulations for the preparation of abstracts and titles, and for ordering reprints of abstracts, if desired, must be carefully followed to insure the appearance of the paper on the program.

1 Abstracts may not exceed 275 words or equivalent space, including title, authors' names, institutional connections, references and acknowledgments. The text of the abstract should consist of a single paragraph. Structural chemical formulae, figures or footnotes cannot be used. Tabular data are discouraged but, if used, must allow setting in a single column, and each line of a table and its heading must be counted as ten text words.

2 The Title heading must be arranged as follows *Line 1 Title*

Line 2 Author/s The name of each non-member author collaborating with member-authors is to be followed by the phrase "(by invitation)". Names of non-members who are introduced, i.e., who are not collaborators with member-authors, are to be followed by the phrase "(introduced by)"

Line 3 Laboratory of origin (as brief as possible)

Line 4 If applicable, one of the following should be stated (a) Read by title, (b) Motion Picture. Put also at the top of the abstract sheet.

Examples See Federation Proceedings, March, 1950 (Vol. 9 No. 1, Part I) for examples of form and style to be followed.

3 The body of the abstract, typed double space, should follow the title heading. If more than one sheet must be used the sheets must be stapled together.

4 Abstracts must be submitted in quadruplicate to the Secretary of the Society of membership, to reach him not later than January 15, 1951.

5 Abstracts should be letter-perfect since there will be no opportunity for proof reading by authors. However, provision will be made for the correction of printer's errors in the June, 1951, issue of Federation Proceedings, if these are reported to Dr. M. O. Lee, 2101 Constitution Avenue, Washington 25, D. C., within two weeks after the Annual Meeting.

Requests for extra hotel reservation forms or extra reprint order forms may be addressed to Society Secretaries or to the Federation Secretary, 2101 Constitution Ave., Washington 25, D. C.

Instruments and Services For Every Radiation Counting Requirement

by

STANDARD NUCLEAR INSTRUMENTS for virtually every radiation counting requirement have been developed and proved in step with the rapid progress of nuclear research. From a pen-size radiation monitor to a complete laboratory, Nuclear offers precision-made equipment of wide versatility and established performance ability.

For special techniques and unusual applications, Nuclear research and engineering personnel are ready and willing to work with you to provide matched Nuclear Instruments to fit your requirements . . . Or to assist in development of special equipment where the need is indicated.

- Scaling Instruments
- Radiation Detectors
- Radioactivity Demonstration Equipment
- Complete Counting Systems
- Monitoring Instruments
- Uranium Prospecting Units
- Complete accessories for the nuclear laboratory
- Special Instruments

The Rat in Laboratory Investigation

*edited by Edmond J Farris, Ph D , Associate Member in Anatomy,
Executive Director, The Wistar Institute of Anatomy and Biology,
and John Q Griffith, Jr , M D , John Q Griffith, Jr , Research
Foundation, Philadelphia formerly Associate in Medicine, University
of Pennsylvania
With 29 Contributors*

This definitive book on the albino rat, which was developed at the Wistar Institute for laboratory investigation, is revised in a new, second edition

Current findings in the economical feeding and breeding of the rats and their use in experimental biology are presented The material on drugs by Dr Harald Holck of the University of Nebraska has been entirely revised and reset, and the tables on dosage and the resulting effects are brought up-to-date There is new material on histologic, staining and calcification methods

Contributions by 29 authorities in the field make up the text, including a chapter on "Gross Anatomy" by Eunice C Greene Here is a comprehensive and reliable source book on the use of the albino rat in laboratory research
New, 2nd Edition 542 Pages 179 Illustrations \$15 00

SUNDERMAN DIRECT READING

CONDUCTIVITY OUTFIT

FOR THE MEASUREMENT OF SERUM TOTAL BASE

CONDUCTIVITY OUTFIT, Sunderman Direct Reading Type, A H T Co Specification
For rapid routine determinations of the electrometric conductivity of small quantities of biological fluids, and particularly for the measurement of serum total base and the estimation of serum sodium Tests can be made with only 1.5 ml of sample

The bridge is an improved, direct reading model of that originally described by F. William Sunderman, *American Journal of Clinical Pathology*, Vol. 19, No. 7 (July, 1949), p. 659. It is of the Wheatstone type, with direct reading dial graduated 5 to 21 in 0.1 divisions, indicating specific conductance expressed as mhos (reciprocal ohms) $\times 10^{-3}$ at 25°C. It is furnished with temperature cell constant compensators and "magic eye" null point indicator, and is entirely self-contained, requiring only the connection of the conductivity cell.

The Conductivity Cell, pipette form, is convenient for the collection of samples from small-mouthed vessels and for subsequent recovery of the sample for further tests. Each cell is individually calibrated and permanently marked with cell constant.

4031 Conductivity Outfit, Sunderman Direct Reading Type, consisting of Conductivity Bridge and Conductivity Cell, as above described, Water Bath 2- $\frac{1}{2}$ \times 4- $\frac{1}{4}$ \times 6 inches, Thermometer Holder of Stainless steel, and Thermometer 0 to 40°C in 0.2° divisions. Complete with directions for use and author's nomogram for calculating serum total base, 5 ft. cord and plug. For 115 volts, 50 or 60 cycles, a.c. **149.00**

4031-B Conductivity Bridge, Sunderman Direct Reading Type, only, as supplied with above outfit, with directions for use and author's nomogram. For 115 volts, 50 or 60 cycles, a.c. **105.00**

4031-E Conductivity Cell, Pipette Form, Sunderman Improved Type, as supplied with above outfit, with platinized electrodes, 30 inch leads, glass bead valve, 20 inches of rubber tubing, mouthpiece and rubber closure for tip. With directions for use and author's nomogram. **34.45**

FEDERATION PROCEEDINGS is published quarterly by the Federation of American Societies for Experimental Biology. The *March* issue consists of the program (Part II) of the Annual Meeting of the Federation, and the Abstracts (Part I) of the papers presented at the scientific sessions. The program includes an author index. The abstracts are arranged alphabetically according to the first author and segregated as to Societies. The *June* and *September* issues contain symposia and other special papers presented at Federation meetings as selected by the Editorial Board. The *December* issue contains the membership list and other matters pertinent to the Constituent Societies of the Federation.

Price Schedule

The subscription price is \$4.50 (\$5.25 foreign) payable in advance. Single issues may be purchased, if ordered in advance, at the following prices: No. 1 (Part I, March, Abstracts), \$3.00; No. 1 (Part II, March Program), 50¢; Nos. 2 and 3 (June and September), \$1.50 an issue; No. 4 (December), \$2.00. Subscriptions and orders should be sent to the Federation of American Societies for Experimental Biology, 2101 Constitution Ave., Washington 25, D. C.

Entered as second-class matter March 16, 1942, at the Post Office at Baltimore, Maryland, under the Act of August 24, 1912.

MY-B-DEN

(ADENOSINE-5-MONOPHOSPHATE, Bischoff)

*now freely available in purer form
for clinical and biochemical research*

Realization of the biochemical role and therapeutic potentialities of MY-B-DEN (Adenosine-5-monophosphate, Bischoff) will now be facilitated by the availability of adequate supplies in exceptionally pure form

Recent technical improvements, devised by Bischoff research scientists, have enabled the preparation of this compound in a much higher state of purity than hitherto MY-B-DEN is now offered as the crystalline free acid with a purity of 99.5%. Complete analytical data, pertaining specifically to the individual MY-B-DEN preparation released, accompanies each shipment

Biochemically, adenosine-5-monophosphate, is a purine nucleotide present in cozymase and the Warburg-type respiratory enzyme, and is a fundamental participant in phosphorylation reactions

Additional compounds of biochemical significance now being released by the Ernst Bischoff Company include TRI-B-DEN and GUANOSINE. TRI-B-DEN is the dibarium salt of Adenosine-tri-phosphate, and is of the highest purity. Analysis data is sent with each shipment. Further packaging and pricing information available on request.

nuclear MODEL L-163

*Radioisotope Analyst for
discriminately detecting
alpha, beta and gamma radiation*

Complete Counting Systems...

FOR SIMPLE, SENSITIVE **nuclear** MEASUREMENT

THE selection of a complete Counting System for your work program has many advantages over the unplanned purchase of separate instruments. NUCLEAR systems consist of a selected group of matched components, each one designed for best use in conjunction with the other units to do a precise and complete research job. There is no complicated rewiring or reconnecting to be done in order to make unmatched instruments work together. NUCLEAR offers a line of complete systems designed and perfected to meet the most exacting requirements of nuclear research. Before you buy, get all the facts about these and other NUCLEAR products and services.

SEND FOR THIS NEW COMPLETE CATALOG!

Complete information on all instruments, including applications, specifications, features, dimensions, etc. Also details on NUCLEAR'S special services and products. No organization engaged in nucleonics should be without this complete catalog!

MODEL 111—Parallel plate Alpha Counting System for counting low activity alpha samples having relatively large area. Consists of parallel plate "pulse type" ion chamber and three stage preamplifier in one unit, plus a scaling unit with integral high voltage supply.

MODEL 117—Methane Flow Alpha Proportional Counter for counting alpha particles in the presence of strong beta activity. The only commercial instrument of its kind, it embodies a methane flow proportional counter, variable, high gain linear amplifier, impulse recorder, high voltage supply, and a scaling circuit of 256.

MODEL L-163—Radioisotope Analyst is especially planned for analyzing radioisotopes. This precise system, which will discriminately detect alpha, beta, and gamma radiation, consists of NUCLEAR'S exclusive "Q G-1s" Counter, plus Model 163 Countomatic Scaling Unit.

MODEL L-165—Packaged Laboratory is a group of instruments which permits precise research or monitoring. It includes a complete scaling unit, a thin mica end window counter, an aluminum Geiger tube mount, and cables and sample dishes.

FRACTIONATION PROBLEMS?

here's help for you . . .

THIS tireless servant in your laboratory will automatically collect any number (up to 200) of rigidly controlled samples of predetermined fluid volumes. Each collected sample may comprise any number of drops from one to four hundred. As each separate sampling is completed, the carriage automatically advances to repeat identical collections consecutively until the whole fractionation has been made.

All you have to do is to set it up for the conditions of the chosen experiment, short or long, and then leave it alone. The machine will plod along without attention hour after hour, all day (and night) long. When the job's done, it will shut itself off.

The Technicon Fraction Collector has been thoroughly tested in actual laboratory installations, where it has proven invaluable to busy research staffs. We shall be happy to send you details.

Ref. Chromatography of Amino Acids on Starch Columns—
W. H. Stein and S. Moore, *Jrnl Biol Chem* 176, 337, (1948)

saves time and labor

relieves laboratory staff of the fretful and time-consuming chore of fraction-cutting releases workers for other duties

triples work output

you can run it twenty-four hours a day, continuously, to triple fractionation output as compared with an 8 hour laboratory day

gives greater resolution

by collecting a large number of small fractions, rather than a few gross ones, you'll get more data from a given fractionation, e.g. a chromatogram, or a fractional distillation

assures accuracy

because the possibility of human error is automatically ruled out. Now fraction-collection becomes a straightforward mechanical procedure.

APPARATUS FOR THE PHYSIOLOGIST

— The Bird Kymograph —

70-060

The Bird Kymograph, pictured as cat #70-060, represents the most advanced design along with practical, convenient and exceptionally rugged construction. It is electrically powered, operates on 110V A C, and has four speeds 22, 110, 54 and 270 cm/min. The drum is 154 mm high with a diameter of 159 mm and is adjustable vertically through 140 mm travel on its center rod.

For long paper work the auxiliary drum, cat #70-130 and the extension arm, cat #70-125 are available. Length of extension can be adjusted from 45 to 85 cm for various paper lengths. Where recording on smoked drum is preferred, the smoking stand and burner, cat #70-150 is supplied. This affords an easy, efficient means of drum preparation.

Write for our latest catalog, "Tools for Biophysics", which lists complete equipment for instruction, control or research in Physiology and Pharmacology.

"HAND" PROCESSING

The tissue, lying at rest merely steeping in a reagent, is surrounded by a "skin" of relatively inactive solution. Permeation is slow, uncertain.

"AUTOTECHNICON" PROCESSING

The tissue moves about in the fluid, as it revolves in the carrier basket. Fresh surfaces are constantly being presented for penetration by a reagent which is, itself, in a state of gentle agitation through the constant rotation of the basket.

A brochure describing the Autotechnicon is available on request.

Not only does the Autotechnicon relieve the laboratory staff of the tedious task of processing tissues "by hand," but it also completes the chosen technique *faster, more thoroughly, more uniformly, more dependably*. The Autotechnicon is versatile . . . it fixes, dehydrates, washes, stains . . . delivers beautifully finished tissues ready for diagnosis.

And because it needs no human intervention, it knows no "working day." To-day's tissues, processed overnight by your own technique, will be waiting for you in the morning.

CATALYTIC ACTION OF THE METAL PEPTIDASES²

EMIL L SMITH

From the Laboratory for the Study of Hereditary and Metabolic Disorders and the Departments of Biological Chemistry and Medicine, University of Utah School of Medicine

SALT LAKE CITY, UTAH

PROTEIN metabolism in the animal begins with proteolysis. The proteolytic enzymes of the gastro-intestinal tract and other tissues hydrolyze the peptide bonds of the proteins to form peptides of varying size and finally free amino acids. It is customary to classify the proteases in two groups: the true proteinases which can attack the high molecular weight proteins and the peptidases which can attack the smaller units, the peptides. Thanks to the work of Bergmann, Fruton and their collaborators (1) we know that this classification is not entirely valid. These investigators have shown that proteinases can hydrolyze simple peptide derivatives. Thus, trypsin attacks such a simple compound as α -benzoyl-L-argininamide at the amide linkage. A more valid classification was initiated by these investigators (1) in distinguishing between the endopeptidases and the exopeptidases. This means that the endopeptidases can attack at the interior of completely or partially substituted peptide chains while the exopeptidases generally attack peptides or their derivatives at bonds adjacent to a free α -amino or α -carboxyl group or both. Hence the terminology which distinguishes between aminopeptidases, carboxypeptidases and dipeptidases. Both the endo- and exopeptidases show a marked specificity toward peptide bonds involving particular amino acids. For example, pepsin attacks compounds like carbobenzoxyglutamylphenylalanine

or carbobenzoxyglutamyltyrosine. The only known compounds which pepsin can attack contain the aromatic rings of tyrosine or phenylalanine residues. Similarly, we speak of leucine aminopeptidase since this enzyme has a markedly rapid action on leucine peptides.

Most investigators agree that enzymes must form definite chemical compounds with their substrates. This thesis, first clearly stated by Michaelis and Menten (2), has been demonstrated by kinetic studies on a large number of enzymes. Keilin and Mann (3) found that peroxidase forms a complex with hydrogen peroxide, and, recently, Chance (4) has studied the spectroscopically well-defined compounds that are formed by catalase and peroxidase with their substrate, hydrogen peroxide. In 1926, Euler and Josephson (5) suggested that the polar groups which are required in the substrates of the peptidases indicate that the enzyme combines with its substrate not only at the sensitive peptide linkage but also with the free polar groups of the substrate, they spoke of this as the di-affinity concept. In other words, the enzyme has a two-point combination with its substrate.

Some years ago, Johnson and his co-workers (6) made the extremely important observation that many of the peptidase activities obtained from animal and plant tissues were greatly increased by the addition of certain metal ions. For example, it was found that leucine aminopeptidase is strongly activated by manganese or magnesium ions. It now appears that the role of the metals in the various peptidase systems is to form the complex between the proteins and the

¹ Detroit, Michigan, April 20, 1949.

² Much of the original work reported in this paper by the author and his collaborators was aided by grants from the United States Public Health Service.

substrates. Evidence of this comes in part from the essentiality of the metal. Leucine aminopeptidase and other peptidases are inhibited by such typical metal poisons as cyanide, sulfide etc. It is also demonstrated by the fact that when the enzyme is purified the activity decreases unless metal ions are added back to the system (7).

The metal does not act simply as an activator of the enzyme but appears to be linked in true chemical combination with the protein of the whole enzyme system. This may be illustrated by the studies on purified leucine aminopeptidase. When protein, metal and substrate are added simultaneously, the activity is, at first, quite low

FIG 1 COMBINATION OF LEUCINE AMINOPEPTIDASE AND Mn^{++} . The curve is the theoretical one from the mass law equation for combination of one Mn^{++} per active group of enzyme (8)

with slow hydrolysis of the substrate, this is followed by a rapidly increasing rate of reaction. In contrast to this, if the metal is allowed to stand with the protein for some time before its addition to the substrate, then it is found that the hydrolysis of the substrate proceeds quite rapidly following the usual kinetics of a first-order reaction. The occurrence of such a time-reaction between the metal and the protein must be interpreted as due to formation of a new compound (7). Similar time-reactions have also been found with many other enzymes, e.g., various peptidases, phosphatase and arginase.

If a complex is formed, then the combination between metal and protein should follow the usual mass action law for such a dissociable complex. The effect of Mn^{++} on leucine aminopeptidase does show the type of curve to be expected for the mass law equilibrium (8). The theoretical curve which is drawn through the data in figure 1 indicates the requirement of one atom of manganese for each active group of the enzyme.

An example of how the metal is bound with its

substrate can be shown with the enzyme which has been called glycylglycine dipeptidase (9). From present information it appears that this enzyme is exceedingly specific, it is known to attack only this one peptide, glycylglycine. This enzyme is strongly activated by the addition of cobaltous ions and a definite spectroscopic complex is formed between glycylglycine and cobalt. This suggested that the enzyme-substrate complex might be formed by combination of the metal with the substrate on one hand and with the protein on the other. Therefore, many compounds were tested both for their ability to be hydrolyzed by the enzyme and for their ability to form complexes with cobalt. The structures are indicated in the following diagram.

If one hydrogen on the free amino group is replaced with a methyl group to form the compound sarcosylglycine, there is complex formation between the substrate and the metal and this compound is susceptible to hydrolysis. If, however, both hydrogens on the amino group are replaced to make N-dimethylglycylglycine, this compound is not hydrolyzed by the enzyme nor does it form a complex with cobalt. If the hydrogen at the sensitive peptide bond is substituted by a methyl group to make glycylsarcosine, there is no complex formation with cobalt and no hydrolysis by the enzyme. If the carboxyl group is altered to make glycylglycinamide, a spectroscopic compound is formed with cobalt but there is no hydrolysis by the enzyme. The complex formed between glycylglycinamide and cobalt has its maximal absorption position shifted about 40 $m\mu$ as compared to that given by cobalt and glycylglycine. It is clear that the chelation, the combination between cobalt and glycylglycinamide, must be different from the combination between cobalt and the substrate glycylglycine. This marked parallelism has also been found with a number of other compounds but they cannot all be mentioned here. Perhaps one more would be of

interest in this connection. The compound β -alanylglycine is not hydrolyzed by the enzyme nor does it form a spectroscopic complex with cobalt. It is well known that cobalt tends to make chelate compounds, that is ring compounds in which there are only five members, and that is the type of complex given by glycylglycine and cobalt. With β -alanylglycine a six-membered ring would be necessary but such compounds are very rare in the cobaltous series.

It appears from this, as a first approximation, that the ability of a compound to be susceptible to the action of this enzyme requires that the compound can form a complex with cobalt. Obviously, this is a necessary condition but not a sufficient condition since many peptides, for example, L-leucylglycine, can form complexes with cobalt but these compounds are not hydrolyzed by this enzyme. On the other hand, such a compound as glycyl-L-leucine, the isomeric peptide, does not form a strong complex with cobalt. Thus, there is exhibited the remarkable specificity of a metal ion in forming a strong complex with leucylglycine and a poor complex with glycylleucine. This specificity is indeed at a very low level. While we are all familiar with the concept that proteins are extremely specific in their combination with various substances, it is interesting to find such a specificity at the dipeptide level.

From the probable mode of combination of metal and substrate, we can begin to understand the differences between a dipeptidase and an aminopeptidase. Glycylglycine dipeptidase requires in its substrate a free amino group, a free hydrogen at the peptide nitrogen and a free carboxyl group; it appears that cobalt forms a complex with three valences bound to the substrate and probably with three valences bound to the protein.³ On the other hand, with leucine aminopeptidase it must be assumed that the metal, either manganese or magnesium, combines only with the free amino group and with the nitrogen at the peptide bond. A free carboxyl group is not required since the enzyme can hydrolyze leucinamide just as rapidly as it can the dipeptide, leucylglycine (7). Thus, we have an explanation in terms of the metal binding with

these substrates of the difference between an aminopeptidase and a dipeptidase.

If the general thesis is correct that the exopeptidases require free polar groups in their substrates because the metal combines with these polar groups, then we must examine carboxypeptidase. This enzyme was first isolated in crystalline form by Anson (10) some years ago, but no attempt appears to have been made to ascertain whether a metal is present. It was found (11) that carboxypeptidase is strongly inhibited by such typical metal poisons as cyanide, sulfide, pyrophosphate, orthophosphate, citrate, oxalate, etc. There is, therefore, a strong indication that a metal is present in carboxypeptidase. Examination, in a sensitive spectrograph, of the ash of a large amount of crystalline carboxypeptidase showed that the only metal present in significant amounts was magnesium. It was extremely gratifying that those metal ions that were used during the purification of the enzyme could not be detected in the final ashed material.

The first part of the thesis is confirmed in the sense that these exopeptidases, or the majority of them, appear to be metal proteins. Unlike the substrates for aminopeptidases and dipeptidases, the substrates for carboxypeptidase do not contain free amino groups. The best substrates for carboxypeptidase are those in which the amino group is blocked by an acylating group (12). For example, a typical substrate is carbobenzoxyglycyl-L-phenylalanine. The terminal carboxyl group is essential for the action of the enzyme. The peptide hydrogen is not essential for the action of this enzyme as is shown by the fact that the enzyme can hydrolyze such a compound as carbobenzoxytryptophylproline (13). Since proline is an imino acid, there is no hydrogen at the peptide bond. The unessential character of the peptide nitrogen is shown very strikingly by the discovery of Snoise, Schwert and Neurath (14) that carboxypeptidase can hydrolyze esters of the correct configuration, such a compound as hippurylphenyllactic acid is hydrolyzed by carboxypeptidase. Therefore, if it is assumed that the metal combines with the substrate in carboxypeptidase, the metal must bind with the free carboxyl group and with the keto group at the peptide bond and not with the nitrogen at all. An interesting correlation appears from this in that the chelate rings formed by the metal with the substrate in each case involve linkages at opposite sides of the sensitive peptide bond (15). It would

³ It had previously been assumed that Co^{++} possessed a coordination number of four in the enzyme-substrate complex (9). A more reasonable description of the data is given by assuming that Co^{++} is bound in a six-coordinate complex.

appear that the explanation of the distinction between the three kinds of exopeptidases that have been discussed is in terms of the nature of the groups bound by the metal in each enzyme

Since the metal in carboxypeptidase is tightly bound, it becomes possible to do quantitative inhibition studies in order to determine how many valences of the metal are available for combination with the substrate or, alternatively, for combination with an inhibitor which binds with the metal. It was found that each active group of carboxypeptidase is capable of binding two cyanide atoms or one orthophosphate or one sulfide

Fig 2 DIAGRAM INDICATES SPATIAL RELATIONSHIPS of the binding of an acylated dipeptide by carboxypeptidase

From these data it would appear that there are two free valences available for combination with the substrate or with an inhibitor (11, 15). This, then, is the true di-affinity as first defined by Euler and Josephson, but it may now be ascribed to the characteristic binding with the metal in the enzyme.

Obviously, in addition to the binding of the substrate by the metal through the polar groups, there are additional binding forces exerted by the protein moiety of the enzyme through the side chains of the substrate. For example, carbobenzyglycylglycine is a poor substrate for carboxypeptidase, but carbobenzyglycylphenylalanine is an excellent substrate (12). This indicates that the protein of carboxypeptidase binds very strongly with the terminal phenyl residue, and we can speak of this as the R group binding by the protein.

The polyaffinity concept first suggested by Bergmann and his co-workers (16) indicates that there must be a correct steric relationship between the polar groups of the substrate and the side chain branches of the substrate. Hence,

carboxypeptidase hydrolyzes only compounds in the L series and not in the D series (17, 18). A simple diagram (fig 2) may be drawn to indicate this polyaffinity relationship for carboxypeptidase. The polar groups are bound through the metal, presumably magnesium, and the R groups are bound by the protein. From the polyaffinity concept and the knowledge that the metal is concerned in binding the polar groups, a beginning may be made in explaining the substrate specificities and inhibition properties of this enzyme. It is known that compounds which have free amino groups are either not hydrolyzed at all or are acted upon extremely slowly by this enzyme (12). It may be supposed that the metal has a greater affinity for the amino group than it does for the terminal carboxyl group, and a different type of complex is formed than in the usual enzyme-substrate complex. Such a combination with a free dipeptide is not a fruitful combination in that the substrate is not hydrolyzed. An explanation for the lack of action is that the linkages are not on opposite sides of the peptide bond but are on the same side (15).

In the same way we can explain why an L-amino acid like L-phenylalanine is not an inhibitor for carboxypeptidase, the combination given by an L-amino acid with the enzyme would be a weak one since no chelate rings are formed. However, Elkins-Kaufman and Neurath (19) found that D-amino acids are strong competitive inhibitors of this enzyme. We must suppose that the reason for this is that in the D-amino acid the R

group binding is extremely strong and that with this orientation a carboxyl group is not presented to the enzyme, but instead, a free amino group (15)

The validity of this concept can be partially tested by inhibition studies of various kinds. For example, the enzyme may be inhibited by blocking the metal portion of the enzyme or by blocking the R group position or both. Ideally, we should expect that the strongest inhibitors would be those that would bind both with the metal and with the R group position of the protein. From the type of scheme that has been indicated, we can predict the type of substances which would be expected to inhibit this enzyme. The sensitivity of the known substrates indicates that the strongest binding at the R position of the protein is given by those compounds that contain aromatic residues (12, 13, 17). It is also to be expected that those compounds that contain carboxyl groups would bind with the metal. It was found that benzylmalonic acid is such a compound. It has two carboxyl groups and it has a side chain much like that of phenylalanine, and it is indeed a strong inhibitor of carboxypeptidase (20). It was found that one mole of benzylmalonic acid combines with each active group of the enzyme. Interestingly enough, the unsubstituted dicarboxylic acid, malonic acid, is only an extremely poor and doubtful inhibitor of carboxypeptidase. Malonic acid at 0.5 M gives only slight inhibition in contrast to the 50 per cent inhibition produced by benzylmalonic acid at 0.003 M. Similarly, other compounds which can block the R group position and which bind with the metal also proved to be strong inhibitors. Such a compound as benzoic acid is a weak inhibitor but phenylacetic acid is quite a strong inhibitor. Likewise, indolacetic acid and indolpropionic acid have been found to be strong inhibitors of carboxypeptidase. From a series of inhibitors of different configuration, we can begin to evaluate and understand the precise limits of the configurations required for binding with the R group and with the metal simultaneously. We can measure the distances in terms of the number of carbon atoms between the functional groups, we can vary the substituents on the aromatic ring, and we can vary the kinds of functional groups. Such studies are now in progress.

What further can be done with these ideas of metal binding with the substrate? As we have indicated the normal enzyme-substrate combination occurs through chelate ring formation of the

metal and the polar groups of the substrate. We must assume, as is known from many studies of inorganic and organic compounds, that the chelation is extremely strong indeed and that where ring formation is not possible, only weak combination occurs. How strong the chelation is between metals and amino acids or peptides is beautifully illustrated by an observation made by Neuberg and Mandl (21). They found that the metal ions known to be important in biological systems could not be precipitated as metal sulfides when amino acids or peptides were present. Moreover, they found that when an amino acid or peptide was added to an insoluble sulfide like zinc sulfide, the sulfide went back into solution. This indicates that the combination of the metal with amino acids or peptides is extremely strong indeed, and such a strong combination must be what is occurring in the enzyme-substrate complexes of the peptidases. The combination in the enzyme suggests that a strong electronic pull is exerted by the metal through the polar groups of the substrate to produce an electronic distortion or deformation at the sensitive peptide linkage (15). This deformation is presumably made still stronger through the combination of the metal with the protein, in other words, we must assume that the rôle of the protein, or part of the rôle of the protein in enzymes, is to make the metals even more electropositive than they normally are. The strong electropositive character increases the deformation at the peptide bond and that is what we mean, then, by the lowering of the free energy of the activation. In other words, the rôle of the enzyme as a catalyst is to lower the free energy of activation, and we can assume that this is caused in some way by the electronic pull through the metal. If this hypothesis is true, the real hydrolysis of the peptide bond is probably due to the acidic or basic catalysis of the hydrogen and hydroxyl ions of the aqueous solution. Hydrogen and hydroxyl ions can catalyze the hydrolysis of the peptide bonds. Normally, this hydrolysis occurs only in strongly acid or strongly alkaline solutions, but with a lower free energy of activation through the mediation of the enzyme, this catalysis now occurs in neutral solution.

As a consequence, the enzymatic hydrolysis of the peptides should follow many of the relationships which govern acid and base catalysis. For example, it is well known that with a series of related esters or amides the rate of the hydrolysis is a function of the strength of the acid which is

linked in the ester or amide bond (22) Examination of known substrates for carboxypeptidase shows this relationship to hold For example, chloroacetylphenylalanine is hydrolyzed very much more rapidly than acetylphenylalanine Obviously, chloroacetic acid is a far stronger acid than acetic acid Similarly, it was reported last year (23) that carbobenzoxy- β -alanylphenylalanine is hydrolyzed about a thousand times more slowly than carbobenzoxyglycylphenylalanine Again it has been found that carbobenzoxy- β -alanine is a much weaker acid than carbobenzoxyglycine (20) In other words, a substantial portion

Fig 3 ACTION OF LEUCINE AMINOPEPTIDASE ON various aliphatic amino acid amides The logarithm of the relative first order velocity constant is plotted as a function of the mass (molecular weight) of the side chain bound to the alpha carbon The initial slope indicates that the rate of hydrolysis is directly proportional to the mass (24)

of what has been called the specificity of an enzyme is not specificity at all but is a function of the free energy of the bond which is exposed to the action of the enzyme

Thus, a beginning may be made in evaluating a number of distinct factors concerned in the specificity of these enzymes First of all, as already indicated, there is the di-affinity concept of Euler and Josephson We interpret this as the ability of the metal to form a chelate complex with the substrate Secondly, there is the polyaffinity concept of Bergmann and his collaborators The R groups must lie in a definite spatial position in relation to the polar groups This is a second factor in specificity A third factor, which was mentioned just a moment ago, is the free energy of the sensitive bond in terms of the acid strength of the carboxyl group which is linked in

the peptide bond Correspondingly, the energetic contribution of the amino group, imino group or ester group will also play a rôle in determining the rate of hydrolysis of such substrates

A fourth factor may be termed the true specificity as determined by the protein, namely, the binding of the R group by the protein itself and the contribution made by this binding in terms of lowering the free energy of activation The R group specificity has been measured very carefully with leucine aminopeptidase (24) Here we find, in contrast to former assumptions that this peptidase attacks only leucine compounds, that this enzyme hydrolyzes a variety of peptides containing different aliphatic residues The simplest compounds are the homologous aliphatic amino acid amides and strictly comparable data have been obtained for their hydrolysis It appears from these data (fig 3) that the binding by the protein of the side chain is a function of the mass of the side chain in terms of its molecular weight This suggests that the binding forces involved may perhaps be those of Van der Waal's forces since it is difficult to visualize other forces which are capable of binding aliphatic side chains Here is a fourth effect which determines the specificity of these enzymes

A fifth factor is one which appears to be a steric effect With leucine aminopeptidase we find that L-leucinamide is hydrolyzed very rapidly, on the other hand, D-leucinamide is hydrolyzed at less than one-tenth thousandth of the rate (7, 24) We cannot fix this in absolute terms since it is almost impossible to make absolute kinetic measurements involving such a slow hydrolysis The difference in rates between these L and D compounds is obviously due to the polyaffinity relationship, namely, the isobutyl side chain of the D-amino acid amide lies in such a position that it cannot combine with the protein at the same time as there is a combination of the amino group and the peptide nitrogen with the metal When the relative rate of hydrolysis of L-leucyl-L-alanine is compared to L-leucyl-D-alanine a different optical effect is observed Here the L-compound is hydrolyzed about 25 times more rapidly than its diastereoisomer, L-leucyl-D-alanine (24) Since the residue attached to the nitrogen of the sensitive peptide bond does not appear to have any affinity for the protein, this must be interpreted as a steric effect in which the methyl group of the D-alanine lies in such a position as to interfere with the combination of the metal with the peptide nitrogen

The residue attached to the peptide nitrogen does not seem to be bound by the protein because the rates of hydrolysis for a variety of compounds are almost identical, L-leucinamide, L-leucylglycine, L-leucyl-L-alanine, and L-leucyl- β -alanine are all hydrolyzed at the same rate so that the presence or absence of a carboxyl group or the change in position from an α -amino group to a β -amino group has no effect whatsoever. Thus, there is a fifth effect which is steric and which can influence the specificity of these enzymes.

To summarize, it may be remarked that while most earlier concepts of enzyme specificity were represented almost exclusively in terms of vague concepts such as lock and key mechanisms, we can now utilize the available information to evaluate separately at least five factors which determine the specificity of an enzyme. Undoubtedly, many other factors will also be discovered. The peptidases represent an extremely favorable group of enzymes in which to investigate these factors because the genius of Emil Fischer and Max Bergmann has given us the techniques for varying the potential substrates almost at will.

Our concepts of how enzymes work has been presented for the peptidases because we seem to be in a better position to do so with this group of enzymes. Obviously, two questions emerge in terms of the general theory which has been presented. First of all, do these concepts apply to other metal enzymes? Perhaps the simplest illustration is to how they apply may be shown with

carbonic anhydrase (15). Here is an enzyme which contains zinc as the active metal as shown by the work of Keilin and Mann (25). The substrate, bicarbonate ion, is extremely simple in character and there can be no great concern about R group binding with the protein. In fact, this factor may be neglected completely and we may suppose that zinc forms a chelate complex with the protein on one hand and with two of the oxygens of bicarbonate ion on the other. Since the bicarbonate ion has a resonating structure it doesn't matter which two are postulated. Hydrolysis is obviously a basic catalysis. After the splitting occurs, carbon dioxide is bound to one valence of the zinc and hydroxyl ion with the other. Since this enzyme is reversible in its action, these are the bindings that lead to the formation of bicarbonate ion. It should be emphasized that the types of linkages that have been postulated are not hypothetical. Zinc binds strongly with carbonate and zinc carbonate is an extremely insoluble substance with little tendency to dissociate. Likewise at pH 7.0 it is well-known that zinc forms subcarbonates which are mixed compounds containing both hydroxyl ions and carbonic acid. Thus, the types of linkages that have been assumed for the reversible action of carbonic anhydrase are identical with those known to exist for ordinary inorganic combinations of zinc.

Similarly, the β -keto-carboxylic acids like oxalosuccinic acid and oxaloacetic acid form beautiful spectroscopic chelate complexes with metal ions as reported by Kornberg, Ochoa and Mehler (26). In fact, with some of these compounds the combination with the metal is sufficient to lower the free energy of activation enough so that decarboxylation proceeds. With others, the protein is required in order to make the metal more electropositive and to lower the free energy of activation still further. Oxalosuccinic acid is rather unstable at pH 7.0 in the absence of any outside agents, adding a trace of metal which forms a chelate complex lowers the free energy of activation enough to allow the decarboxylation to proceed. On the other hand, acetoacetic acid is rather stable in aqueous solution and combination with metal alone does not lower the free energy of activation sufficiently. Here the specific protein is required. In a similar manner, these concepts of the chelate complexing of metals may be applied to various other metal enzymes such as the phosphatases, phosphorylases, etc.

A second question is, what about those enzymes

which do not contain metal ions. The discovery of the metal in carboxypeptidase represents an object lesson in our type of thinking. Perhaps other enzymes which are known to exist in fairly homogeneous form should be tested for the presence of metal ions. On the other hand, there are many enzymes like crystalline trypsin, which do not contain metal ions. We examined the action of various substances on crystalline trypsin and could not find any inhibition whatsoever by the usual metal poisons (11). Here our thinking must be different.

Since it is probable that all enzymes function by a fundamentally similar mechanism, let us assume that the chelate character of the enzyme-substrate combination is correct, and that the lowering of the free energy of activation is due in each instance to electronic deformation. Then, where there is no metal present, the rôle of the

metal ion must be taken over by other groups within the protein itself. There are extremely electropositive and electronegative groups in proteins. It would be useless at the present time to speculate as to the nature of these active groupings in the various enzymes. This is an experimental task for the future. However, it is well to recall at this point the extremely valuable and fundamental observations of Bergmann, Fruton and their collaborators (1) on the synthetic substrates of trypsin and other proteinases. Trypsin hydrolyzes synthetic peptide derivatives which contain free polar groupings, benzoylargininamide contains a free guanido group, benzoyllysineamide contains a free epsilon amino group. We must suppose that there is a combination between these polar groupings and groups at the peptide linkages with as yet unknown groups in the enzymes.

UPTAKE OF LABELED AMINO ACIDS BY TISSUE PROTEINS IN VITRO¹

HENRY BORSOOK, CLARA L. DEASY, ARIE J. HAAGEN-SMIT,
GEOFFREY KEIGHLEY AND PETER H. LOWY

From the Kerckhoff Laboratories of Biology, California Institute of Technology

PASADENA, CALIFORNIA

THE uptake of labeled amino acids by tissue proteins has been construed by workers in this field to be the same as protein synthesis. We shall return to this topic later. Assuming, for the moment, this to be true, there can be no question that those who have entered the field were influenced by the work of Schoenheimer and his colleagues (1) who proved that the rate of protein degradation and resynthesis *in vivo* was much faster than was envisaged in the theory of endogenous and exogenous protein metabolism. We, in the Pasadena laboratory, had come to this conclusion some years earlier (2). Our evidence was mainly indirect, some additional evidence came from crude labeling experiments, and some was inferred from data on the free energy of formation of the peptide bond. We referred to the dynamic steady state of breakdown and synthesis of protein as the 'continuing metabolism' of nitrogen. The response to this view, generally, was unsympathetic. The direct and incontrovertible evidence came from the experiments of Schoenheimer and his colleagues on the feeding of N¹⁵ labeled amino acids and ammonia. This work and the clearing up of the problems of creatine (3-5) and of creatinine (6-8) formation cut away all the support of the theory of endogenous and exogenous metabolism of protein.

We were emboldened then to look with labeled amino acids for evidence of protein synthesis *in vitro*.

In vitro studies employing tracers appear to offer the best chance, at present, of gaining some insight into the mechanism of the biological synthesis of protein. The following considerations indicate the experimental problem of finding evi-

dence of protein synthesis *in vitro*. The minimum duration of the *in vivo* experiments with N¹⁵ labeled amino acids was 3 days, *in vitro* the maximum time is about 6 hours. On the basis that the rates *in vitro* would be the same as *in vivo* the concentrations of labeled amino acids likely to be in a tissue protein were, therefore, in the *in vitro* experiments 1/12 or roughly 10 per cent of those *in vivo*. Furthermore, whereas the whole organs or carcasses of several animals are available for analysis after an *in vivo* experiment, only 100 mg of protein or less may be available after *in vitro* experiments, especially where one wishes to make a series of comparisons. Roughly, then, the amount of a labeled amino acid to be measured after an *in vitro* experiment is about 1 per cent or less of that after an *in vivo* experiment. With radioactive isotopes such as C¹⁴ and S³⁵ this can be done easily. One tenth of a microgram of a labeled amino acid with a specific activity of 100,000 count/min/mg can be measured. We have been able to use leucine and lysine with specific activities as low as 6000 counts/min/mg.

C¹⁴ is the isotope which has been used most in *in vitro* work so far, it is especially convenient because of its long half life of 5100 years and ease of measurement. S³⁵ has a half life of 87 days. Tritium has been made available recently, its half life is 31 years.

Table 1 gives some figures on the amounts of different labeled amino acids taken up *in vitro* by intact cells of different animal tissues. Animal tissue slices or cells were suspended in a saline solution containing the labeled additive and incubated at 36 to 38°. The experimental time varied from 2 to 6 hours, the figures given represent approximately the maximum uptake and indicate the orders of magnitude in the longest time it is useful to run experiments of this kind.

The table shows that both indispensable and dispensable amino acids are taken *in vitro* by tissue proteins. Every tissue so far tested has

¹ The experimental data of the authors presented here were obtained in a project under the joint sponsorship of the United States Atomic Energy Commission and the Office of Naval Research.

taken up every labeled amino acid presented to it

Of the normal tissues so far investigated the uptake was fastest in bone marrow cells. The rates were slower and approximately equal in liver slices and in diaphragm. It is interesting that the CO_2 of bicarbonate is so rapidly taken up

into the dicarboxylic acids of proteins. The rapid uptake of labeled amino acids by bone marrow cells and diaphragm indicate that these tissues may be useful biological objects for a variety of physiological and pathological studies.

The figures on the amounts of labeled amino acids taken up have, as they stand, only an operational significance. From figures such as these one can calculate how many counts one is likely to find in the protein. A more relevant presentation of the results is as percentage of the labeled amino acids in the protein which had become

labeled, and to compare those figures with comparable ones obtained by Schoenheimer and his colleagues with N^{15} labeled amino acids *in vivo*. For example, the latter workers found that after feeding N^{15} labeled leucine to a rat for 3 days 8 per cent of the leucine in the liver proteins was labeled (1), we may say, therefore, that in 4 hours about 0.5 per cent was labeled. Our figure for bone marrow cell proteins *in vitro* in 4 hours is 1 per cent. In rat liver slices Melchior and Tarver

found 0.3 per cent of the methionine labeled in 4 hours, Zamecnik *et al.* found 0.23 per cent of the alanine labeled in 4 hours and 5 times this amount in hepatoma cells. The uptake of L-lysine by liver homogenate is about as fast as *in vivo* (14). These estimates, rough as they are, are sufficient to indicate that the uptake of labeled amino acids by tissue proteins is of the same order of magnitude *in vitro* as *in vivo*.

The uptake of labeled amino acids is much faster in embryonic and malignant than in normal adult tissues (table 2). Rabbit bone marrow cells which have the fastest uptake of any tissue in normal animals so far tested belong, of course, with embryonic tissues.

Mechanical damage to cells reduces the rate at which their proteins take up labeled amino acids

(tables 3 and 4) The important point is that liver homogenate (table 5) does take up glycine, leucine and lysine at a considerable rate. The rate of uptake of glycine by an homogenate is, to be sure, slower than in liver slices, but only one third slower, and the rate of uptake of lysine is as fast as *in vivo*. The uptake of lysine by liver homoge-

nate appears to be a special case of which we shall have more to say later.

But an homogenate is neither an enzyme solution nor a suspension of insoluble protein. A large fraction of the suspension consists of organized particles such as nuclei and mitochondria. When working with homogenates we are not free of organized structures, and the level of organization of the particles is much higher than even that of proteins.

Tissues differ in the rates at which they take

up different amino acids (table 6). The differences in the absolute rates are much greater than that of the relative rates. Thus bone marrow cells take up the 3 amino acids five times as fast as diaphragm although the order is the same.

In the one case tested so far, that of lysine, the L-isomer is taken up by liver homogenate protein much faster than the unnatural D-form (table 7). A part *certainly*, and possibly *all*, of the effect with the D-lysine may be ascribed to the small amount of the L-form in the D-preparation used.

In the course of an experimental run the rate of uptake of labeled amino acids by rabbit marrow cells and rat diaphragm is nearly linear up to 3

to 5 hours (fig. 1). In the case of glycine (fig. 2) with liver homogenate the rate is logarithmic up to 6 hours (when uptake is plotted against the logarithm of the time a straight line is obtained). In all of these cases whether the rate is linear or logarithmic it does not decline appreciably up to 3 to 4 hours. *Lysine* in liver homogenate again is an exception, the reaction comes to a stop in 2 hours (fig. 2).

The dependence of the rate of uptake on the initial concentration of labeled amino acid is in all cases but one up to a concentration of 50 mg per cent, (approximately 0.005 molar) logarithmic (figs. 3, 4 and 5). High concentrations may be somewhat inhibitory, as has been observed in other enzymatic reactions with amino acids. The exception again is the uptake of lysine by liver homogenate (fig. 5). The relation of uptake to initial concentration of labeled lysine is in contri-

distinction to all the other cases linear instead of logarithmic

The important point in the data of figures 3, 4 and 5 is that the concentrations of labeled amino acids from which tissues can incorporate them into their proteins are of the order of those in the blood. And the dependence of the rate of uptake on the concentration of labeled amino acid is greatest in the physiological range of concentration

FIG 1 RATES of uptake of amino acids (12)

FIG 2 RATES of uptake of amino acids

Some years ago we determined the free energy of formation of the peptide bond in a number of simple di- and tri-peptides. It was clear that over the pH range from 4 to 8 and at any practical amino acid concentration the equilibrium position was beyond 99.9 per cent hydrolysis of the peptide. Ionization constants and solubilities were taken into account. Peptide synthesis, under physiological conditions, could not, therefore, be a simple mass action reversal of hydrolysis (2). The process must be coupled with an energy donating reaction. Most of the protein in the cell is unhydrolyzed, and not because the system is inert, Schoenheimer and his colleagues proved that the proteins of all tissues are continually being broken down and resynthesized. At thermodynamic equilibrium the protein of the body

would be practically all hydrolyzed if not coupled with energy donating reactions. The steady state with regard to proteins is maintained where it is by the respiration of the cell.

It was to be expected, therefore, that if the uptake of the labeled amino acids by tissue proteins

FIG 3 EFFECT ON UPTAKE of concentration of amino acids. The abscissa is on a logarithmic scale, ordinates for each curve are fractions of the maximum

FIG 4 EFFECT ON UPTAKE of concentration of amino acids. The abscissa is on a logarithmic scale, ordinates for each curve are fractions of the maximum

is, indeed, peptide synthesis that this process would be inhibited by inhibition of respiration. Figure 6 shows that this is the case. The effects of dinitrophenol and of arsenate suggest that respiration promotes peptide synthesis by way of phosphorylation.

The foregoing observations are in accord with those of all other workers. Thus Melchior *et al* (13) found that the uptake of methionine by *E. coli* was inhibited by azide, fluoride and cyanide, Winnick *et al* (16) found that oxygen consumption and glycine uptake by rat liver homogenate went together and that the process was inhibited by

anaerobiosis Frantz *et al* found that anaerobiosis (17) and dinitrophenol (18) inhibited the uptake of alanine by rat liver slices

The exception, again, is the uptake of lysine by the proteins of guinea pig liver homogenate Table 8 summarizes some of the major differences in the process of lysine uptake by liver and that of all other amino acids in all tissues so far examined Lysine is taken up by at least two differ-

occur In the latter case most of the free energy of the bond is retained in a complex of the enzyme and one cleavage product Another cleavage product may then recombine with that on the enzyme and so reconstitute a peptide bond, and this process would be independent of respiration

We have surveyed the effects of metal ions such as cobalt, copper and manganese on the one hand because of the well known effects of cobalt and of copper on hemoglobin and red cell formation, and

FIG 5 EFFECT ON UPTAKE OF CONCENTRATION OF amino acids The abscissae for the glycine and lysine curves are logarithmic and linear, respectively, ordinates are fractions of the maximum

ent processes in liver homogenate, characterized by differences in pH optimum, dependence on calcium ions, sensitivity to fluoride and to oxidation and phosphorylation inhibitors (14)

The findings with lysine caution against generalization even with respect to so elementary a condition as dependence of amino acid uptake on respiration. Synthesis of peptides by coupled reactions between peptides and hydrolytic enzymes, as discovered by Bergmann and his collaborators (19), may play a part, and these would not depend on respiration. Or syntheses analogous to those of disaccharides by sucrose phosphorylase discovered by Doudoroff *et al* (20) may

Concentration of inhibitors was 0.001 M

on the other because the activity of a number of peptidases depends on these ions

In bone marrow cells cobalt, copper and manganese were inhibitory with all 3 amino acids over a range of 0.05 to 0.001 molal. The final concentrations of the free metal ions in the reaction medium were certainly much less than these. Substantially the same effects were observed in diaphragm. Of the 3 metal ions copper was the most inhibitory and manganese the least. In liver, copper was inhibitory at an added concentration of 0.001M or higher. Manganese was not inhibitory and at concentrations below 0.001M there may have been a slightly increased rate of uptake. These findings argue against participation of peptidases in the uptake of labeled amino acids by tissue proteins.

The effects of cobalt in liver homogenate were especially interesting and point to the need of

caution in interpreting the effects of metal ions Table 9 shows that the addition of cobalt (Co Cl₂) increased the counts which could not be washed out of the protein after the homogenate had been incubated with labeled leucine or glycine But after the proteins (which had been exhaustively extracted with trichloroacetic acid) were treated with the ninhydrin reagent the CO₂ liberated gave a larger fraction of the counts originally in the protein As the ninhydrin reagent liberates CO₂ from the carboxyl groups of amino acids only when both their carboxyl and amino groups are free, we have interpreted this result as indicating

the formation of a protein-cobalt-amino acid complex Similar results were obtained with lysine, but as the latter amino acid was labeled in the ϵ -position treatment with the ninhydrin reagent could not be used to demonstrate the protein-cobalt-amino acid complex Table 9 shows that as far as the actual incorporation of amino acids into the proteins is concerned, cobalt was inhibitory, as it was in marrow cells and in diaphragm

The degree of complex formation is greater the greater the concentration of added cobalt Not all proteins form this complex with cobalt to the same degree The most active we have found are those in the sedimented fraction of liver homogenate, diaphragm proteins come next, bone marrow proteins and egg albumin are the least active Amino acids also vary in their ability to partici-

pate in this complex formation Of the 3 amino acids we have tried the order of effectiveness is leucine, glycine and lysine The formation of this complex takes about 6 hours to reach completion at 38°, it does not proceed below pH 6.0, and increases progressively at pH values above that

Having several tissues each of which was capable of taking up glycine, leucine and lysine we were in a position to examine whether the amino acids mutually influence their uptake The results summarized in figure 7 show that glycine, leucine and lysine are taken up independently in the 3 tissues tested The counts in the protein when all 3 amino acids were added together was the sum of the 3 added separately

In other experiments addition of 2 radio-inactive amino acids together with one which was radio-active did not affect the uptake of the latter Nor did the addition of a mixture of amino

FIG 7 UPTAKE OF AMINO ACIDS added separately and together (12)

acids approximating the composition of casein or of hemoglobin affect the uptake of labeled glycine, leucine or lysine

This result needs to be correlated or reconciled with the observations in feeding experiments (21-25) It was found in those experiments that an indispensable amino acid is ineffective for growth or recovery from protein depletion unless it is fed within a few hours of other necessary amino acids In all of the *in vitro* experiments so far the tissues no doubt contained all the normal amino acids to some extent

A major assumption underlying all this work is that radioactivity in the protein after incubating a tissue with a radioactive amino acid means that the labeled amino acid has been incorporated into it by peptide bonds The whole structure of interpretation rests on this assumption It has not been proved

After it was found possible to identify with the ninhydrin reagent the binding of labeled amino acids to protein by cobalt all the crucial experiments with bone marrow cells, diaphragm and liver homogenate with glycine and leucine were repeated and the ninhydrin test applied to their

radioactivity The test is applicable to our glycine and leucine, which were labeled in their COOH groups, but not to the lysine, which was labeled in the ϵ -position The CO₂ liberated by ninhydrin from all the radioactive proteins, in those experiments in which no cobalt was added, gave no counts We may conclude, then, that the labeled amino acids were bound in such manner that either their COOH or their amino groups were masked, possibly by participation in peptide bonds but possibly also in bonds of some other kind

In many of the experiments by other workers and in all of ours the labeled amino acid was recovered as such after acid hydrolysis of the protein This showed that the radioactivity was carried into the protein by the labeled amino acid in such form that the amino acid could be recovered as such after complete acid hydrolysis

The results of this test and of the ninhydrin test were necessary but they are not sufficient evidence, they are not proof that the labeled amino acids were incorporated by peptide bond formation

It would be proof if a peptide could be isolated and identified among the partial hydrolysis products of a radioactive protein To obtain such evidence bone marrow protein was obtained radioactive by incubating the cells with labeled leucine An aliquot of the protein was treated with ninhydrin and the CO₂ evolved gave no counts The protein was partially hydrolyzed with a mixture of strong acetic and hydrochloric acids for 10 days at 38°, and the hydrolysate was then chromatographed on a starch column according to the method of Moore and Stein (26) The effluent fractions were analyzed with the ninhydrin reagent for amino nitrogen and also for radioactivity One region was found of coinciding ninhydrin color and of radioactivity The position of this region was in advance of the position of leucine, in fact 2 non-radioactive ninhydrin bands intervened between it and the leucine band Over 90 per cent of the radioactivity originally in the protein was in the one radioactive band

Fractions at the peak of the radioactive band were pooled and completely hydrolyzed with HCl, and the hydrolysate was again chromatographed The complete hydrolysate gave a starch chromatogram indicating 17 or more amino acids in the hydrolysate All of the radioactivity was confined to the leucine plus isoleucine band Carrier isolation was then applied to this radioactive

fraction and all of the radioactivity was identified as being in the leucine These results showed that partial hydrolyses of the radioactive protein liberated the incorporated radioactive leucine in a large peptide

The objection to this particular piece of evidence is that the radioactive fraction in the partial hydrolysate emerged from the starch column too soon for good resolution, and the peptide fraction in which the radioactivity was found was too complex for determination of its structure

We have repeated this experiment several times on bone marrow protein containing labeled glycine, leucine and lysine Among the partial hydrolyzed products a large peptide was found containing leucine and lysine

This kind of evidence brings us closer to rigorous proof that the labeled amino acids taken up

TABLE 10 SYNERGISTIC ACTION OF FRACTIONS OF GUINEA PIG LIVER HOMOGENATE ON UPTAKE OF GLYCINE (12)

INCUBATED WITH FRACTIONS SEDIMENTED AT 2500 g	FRACTIONS SEDIMENTED AT 30 000 g	RADIO- ACTIVITY OF PROTEIN Cts/min/mg	WEIGHT OF PROTEIN mg	TOTAL RADIO- ACTIVITY OF PROTEIN Cts/min

+	+	0 72	124	89

by the protein are incorporated by means of peptide bonds, but it is not yet proof It will be necessary to identify the peptides, isolate them and show that the labeled amino acids are constituent amino acids of the peptides

However the evidence at hand, as far as it goes, is in accord with the interpretation that the labeled amino acids are taken up by tissue proteins in peptide bonds There are no discrepancies and the evidence is quite varied in character

Multiple labeling of protein followed by partial hydrolysis and isolation of the peptides promises to be a new and useful method of determining the detailed amino acid pattern of proteins

Workers in the field of biological oxidations are finding that they have to deal with organized cytoplasmic particles We have found this in the methylation of guanidoacetic acid by methionine in liver homogenate We are now finding the same in this field Table 10 summarizes a result we have obtained with labeled glycine in guinea pig liver homogenate The fraction sedimented at 2500 g which consists largely of mitochondria, takes up glycine actively, the fraction sedimented

above 30,000 g, microsomes largely, take up much less, when the two fractions are incubated together the amount of glycine taken up is about double the sum of the two when incubated separately. There is clearly a synergistic action between the two sets of particles.

A summary of the situation in this field at present runs somewhat as follows. All the tissues so far tested can take up *in vitro* into their proteins every labeled amino acid which has been presented to them. The most active normal tissue in adult animals is bone marrow. The uptake of every amino acid in every tissue, with one exception, is immediately dependent on respiration.

The exception is the uptake of lysine by liver homogenate. The effective range of labeled amino acid concentration is within the order of that in the plasma, and the rate of uptake is of the order of that *in vivo*. Glycine, leucine and lysine are taken up independently of each other. The evidence indicates that the amino acids are taken up in peptide bonds, but this point is not yet proved. There is evidence in the case of liver homogenate, at least, of a synergistic action between two sets of intracellular particles.

A one sentence summary is that the field of the biological synthesis of protein is now wide open.

MECHANISM OF PEPTIDE BOND FORMATION

FRITZ LIPMANN

From the Massachusetts General Hospital and the Harvard Medical School

BOSTON, MASSACHUSETTS

THE present understanding of the mechanism of peptide synthesis derives mainly from the study of relatively simple reactions. The animal body has fortunately supplied a number of model reactions for the study of synthesis of peptidic¹ links in two-component systems. Reactions of such a type are found among the so-called detoxication reaction, hippuric acid synthesis as well as acetylation of aromatic amine are relatively convenient model systems. The study of the acetylation of aromatic amines (1) in particular has relatively early furnished valuable detail which appears now rather generally applicable. It will, therefore, be advantageous to summarize first results obtained with this reaction.

ACETYLATION OF AROMATIC AMINES

Our interest in this reaction had originally been aroused by the finding of acetyl phosphate as an intermediary in a reaction chain geared apparently on generation of energy-rich phosphate bonds (2). The emergence of this particular molecule, however, suggested that it might not only be a link, as it indeed can be, in a phosphate transfer chain. It was suggestive to imply that acetyl phosphate may, with the appropriate catalyst, also offer its organic part in a state of activation for synthesis (3). This expectation led rather early to the generalization that carboxyl activation by phosphorylation may be a major phase in biosynthesis (3).

After initial disappointments with the use of synthetic acetyl phosphate, it was observed that acetate plus adenylyl pyrophosphate (ATP) would serve in pigeon liver extract as acetyl donor to aromatic amines (1). Using a protein fraction of pigeon liver extract a near equivalence of ATP

¹ To simplify the following discussion, the term "peptidic link" is introduced as generic name for a $-NH-CO-$ link between any amino or carboxyl group. The term "peptide link" is then reserved for the 1-carboxyl, 2-amino-link between two α -amino acids as it occurs in protein.

breakdown and sulfonamide acetylation was obtained (4).

In table 1 a closely related reaction is included, namely, the activation of acetate by ATP to form hydroxamic acid in the presence of hydroxylamine. With a somewhat greater activity for hydroxamic acid formation in this extract, the stoichiometric relationship between acetylation and phosphate mineralization appears more clearly than in the case of sulfonamide acetylation. The overall condensation reaction is thus formulated:

R stands here for either aromatic residue or the hydroxyl group of hydroxylamine.

The hydroxamic acid reaction has proven a very helpful tool in the investigation of acyl activation. Some time ago, quite accidentally, we had become aware of an explosive, non-enzymatic liberation of inorganic phosphate from acetyl— or other acyl—phosphate on addition of hydroxylamine. The corresponding hydroxamic acid is formed which gives with ferric ion a deeply purple colored complex. This reaction is used now for a colorimetric determination of the acyl phosphate (5). Furthermore, if added to an enzymatic system, hydroxylamine may act as a trap for activated carboxyl groups which thereby become accessible to determination by the color reaction (6, 9, 10). Due to the great reactivity of hydroxylamine, the evaluation of such results requires well controlled conditions (cf. 7).

The further establishment of the carboxyl group as the site of activation in peptidic synthesis appeared important. In view of the existence of an energy-rich N-P phosphate bond in creatine phosphate, the possibility of a primary phosphorylation of the amino group appeared plausible. As mentioned previously, experiments

with synthetically prepared acetyl phosphate as acetyl donor for amines had proven unsuccessful. More recently, however, Dr Kaplan studied in our laboratory a compound formed by enzymatic phosphorylation of acetate with ATP, or phosphopyruvate plus ADP, in extracts of *E. coli*. He found it to differ in some respects from synthetic acetyl phosphate. This 'natural' ATP-acetate reaction product appeared active as acetyl donor, the compound was shown to condense with for-

if the two steps represent separable enzyme systems³.

GLUTAMINE

We now turn to the discussion of a very similar but more truly 'peptidic' reaction, the synthesis of glutamine. Speck found this reaction in acetone pigeon liver extract (9) prepared analogously to the one used in our sulfonamide acetylation experiments. In such an extract, glutamic acid, ATP and ammonia yield anaerobically glutamine when cysteine and magnesium ion are present. So far no indication for an involvement of coenzyme A in this reaction has been found. It is significant that hydroxylamine is practically as effective an acceptor as ammonia. This reaction is very rapid. In the experiment shown in table 3, 0.15 ml extract were used only and in 15 minutes nearly 2 micromoles of glutamine were formed.

TABLE 1 COMPARISON OF PHOSPHATE MINERALIZATION AND AMINE ACETYLATION OR HYDROXAMIC ACID FORMATION IN FRACTIONS OF PIGEON LIVER EXTRACT¹

² + acetate

mate in extracts of *E. coli* yielding pyruvate. It also acts, as shown in table 2, as acetyl donor for aromatic amines, significantly still requiring coenzyme A (8).

This observation then allows us to divide the overall reaction into two steps,

The intermediate formation of an acyl phosphate in the synthesis of a peptidic link is therewith established. It remains, however, still doubtful

TABLE 3 GLUTAMINE SYNTHESIS IN PIGEON LIVER EXTRACTS¹

Without glutamate	0.13	0.54	0.11

¹ SPECK, J. F. *J. Biol. Chem.* 168: 402, 1947

With this rapid synthesis and a relatively low background ATP-decomposition the stoichiometric relationship between ATP breakdown and glutamic acid-ammonia condensation appears most clearly. Such rapid phosphate transfer followed immediately by condensation leading eventually to phosphate liberation is remarkable. It should make one very cautious not to mistake an ATP-decomposition of such a type for ATP hydrolysis. For instance, with some ammonium ion present, as is the rule in any crude tissue extract, an ATP breakdown with added glutamate, due to glutamine formation, could easily be mistaken for a 'glutamate-catalyzed ATP-ase' effect.

Simultaneously with Speck, Elliott in Cambridge, England, found in acetone brain extract (10) and in bacterial preparations (11) an analogous glutamine and glutamhydroxamic acid syn-

³ Recently a separation of the two enzymes, catalyzing steps 1 and 2, was accomplished by acetone fractionation of pigeon liver extract in the cold (14).

thesis (table 4) Although Speck as well as Elliott was not able to show an acyl phosphate accumulation in the absence of an acceptor, the reaction with hydroxylamine strongly indicates carboxyl activation as a primary reaction

HIPPURIC ACID

A third peptidic synthesis of this type was found to be hippuric acid condensation. The p-aminohippuric acid synthesis has been studied extensively by Cohen and his group (12) in rabbit liver homogenate. In this case the synthetic activity is particle-bound. The figure 1 from Cohen's paper (12) shows anaerobic synthesis due to addition of ATP. Because of the considerable

Fig 1 SUPPORT of anaerobic hippuric acid formation by ATP. Rat liver homogenate in nitrogen (12)

background decomposition of ATP, a large excess of this reagent has to be applied in such a particle suspension, which obviates experiments on the stoichiometry.

These three examples of peptide bond formation summarized in figure 2, we may conclude, present a thoroughly analogous situation: the energy-rich phosphate of ATP acts as immediate energy source, attaching itself primarily to the carboxyl component. Certainly this is so in the case of acetylation and presumably also in glut-

amine and hippurate synthesis. The inability to isolate the primary reaction products in tissue experiments at least, may be due to the presence there of a very active acyl phosphatase in such preparations (13). It should be pointed out, however, that in Speck's experiments glutamic acid alone causes only little if any specific ATP breakdown. And, conversely, no ATP breakdown occurs with ammonia and hydroxylamine alone. This may be due to a special construction of the enzyme which permits reaction only if both the primary phosphate acceptor and the second participant in the condensation reaction are present. Or, the equilibrium conditions or the transfer from ATP allow no appreciable accumulation of the reaction product. The definite answer to such rather important questions of finer reaction mechanism may be obtainable by fractionation of pigeon liver extract and such experiments are in

Fig 2 SYNOPSIS of ATP-dependent peptidic syntheses. Two-component systems

progress. Presently, we have only found that glutamine synthesis and acetylation may quite easily be separated on fractionation with ammonium sulfate (14).

GLUTATHIONE

So far we have considered only two component systems and it is not too surprising that at this still exploratory stage best information on the mechanism is available with these relatively simple reactions. Promising progress, however, was made recently with the study of the mechanism of synthesis of a tripeptide, namely glutathione.

After the use of isotopes as a rapid turnover rate with this abundant cell constituent, Bloch reported to have obtained in liver homogenate support of anaerobic incorporation of radioactive glycine when ATP was added (15). No exchange occurred in the absence of a phosphate donor. He now has been able to obtain the reaction in acetone pigeon liver extract, which seems to be an almost inexhaustible source of ATP.

clear that a single energy-rich phosphate bond is used to effect a single peptide link. This is evidenced by the one to one relationship between synthesis and phosphate liberation. Judging plainly from the energy data, the possibility would

the limits of 2500 and 3000 calories per peptide bond.

On the other hand, the pyrophosphate link in adenylyl pyrophosphate represents 12,000¹ calories (3). This means that excess energy is spilling

Fig 4 *m*-DINITROPHENOL INHIBITION. Comparison of the inhibition by dinitrophenol of phosphorylation and protein synthesis. The inhibition of phosphorylation was measured in kidney homogenate as described by Loomis and Lipmann (20). Protein synthesis was measured in liver slices. The data reproduced are taken from the paper by Frantz *et al* (21). For better comparison the data are given in percentages of normal oxygen uptake, phosphorylation and alanine incorporation.

² LIPMANN, F. *Advances in Enzymology* 1:99, 1941

exist that an energy-rich phosphate bond could cover two or even more peptide links. Thus, however, would anyway be unlikely for reasons of reaction mechanism.

The energy requirement for peptide synthesis has been determined by Borsook (23). His earlier data were recently revised and extended and Dr Borsook has kindly permitted me to use his most recent and as yet unpublished results. This and related data are listed in table 6. The energy figures for a number of typical peptides show no great deviation from the average and fall inside

Fig 5 CHARTING OF RELATIONSHIP between the two energy levels dominant in cellular chemistry and corresponding to energy-rich and energy-poor phosphate bond levels.

over with a net utilization of around 20 to 25 per cent in the formation of the new bond. The scheme of figure 5 indicates such correlation between energy donor and acceptor system to be a very general occurrence in cellular synthesis.

As has been earlier pointed out elsewhere (3), there is a distinct grouping around two energy levels, a higher one at 12,000 calories and a lower at 3000 calories. The energy-rich phosphate bond carries excess energy if performing condensation

reactions on the lower level, as, e g, ester, peptide and glucoside syntheses. In such rather frequent instances then not more than about a quarter of the available energy is utilized.

This appears, however, not too surprising. The

more and more realized applicability in biosynthesis of a standard form of energy for a great variety of purposes has to entail in some instances a more or less pronounced loss of energy, in exchange for a simplification of procedure.

MECHANISM OF UREA SYNTHESIS

SARAH RATNER

From the Department of Pharmacology, New York University College of Medicine

NEW YORK CITY

IN 1932 Krebs succeeded, for the first time, in demonstrating the *in vitro* formation of urea in mammalian liver. He showed in further detail that the synthesis proceeds by a stepwise mechanism, the ornithine cycle. It is of interest to recent developments in this field that the rapid formation of urea in rat liver slices, as carried out by Krebs and Henseleit (1), required the presence of lactate and oxygen in addition to ornithine, bicarbonate and NH_3 .

More recently Cohen and Hayano established the conditions for obtaining arginine synthesis (2) in rat liver homogenates starting with citrulline (Step II of the ornithine cycle), and for obtaining citrulline synthesis (2) from ornithine (Step I). According to their studies of Step II, glutamic acid, rather than NH_3 , appeared to be the nitrogen donor in arginine formation from citrulline. Mg ion, catalytic amounts of adenosine triphosphate (ATP) and oxygen were required in addition to the amino acid substrates.

Similar results had been obtained in kidney slices with glutamic and aspartic acid by Borsook and Dubnoff (3) who proposed that the transfer of the $-\text{NH}_2$ group occurred by a transamination accompanied by the simultaneous oxidative removal of 2 H atoms (transimination). An α -keto acid, thought to be the second product of the reaction would, of course, escape detection in respiring preparations.

Under the conditions of Borsook and Dubnoff, or of Cohen and Hayano, neither slices nor homogenates can form arginine in the absence of oxygen. Moreover, since the latter group found glutamic acid to be much more effective than aspartic acid in liver homogenates, they considered glutamic acid to be the specific $-\text{NH}_2$ donor in the transamination reaction. Aspartic acid was thought to be active only in so far as it could be converted to glutamic acid. We hoped that further insight into the nature of this mechanism might be gained from a study of the isolated system.

By separation and partial purification of the enzymes involved in the citrulline to arginine conversion, it can be shown that aspartic acid is the specific $-\text{NH}_2$ donor and that the transfer of nitrogen does not involve an oxidative step. The enzymes concerned are quite soluble and may be readily obtained from extracts of acetone powder mammalian liver. They withstand exposure to alcohol and ammonium sulfate fractionation procedures at low temperature and keep moderately well (4).

Mechanism of Nitrogen Transfer In the reaction, aspartic acid and citrulline are converted to arginine and malic acid, anaerobically, in the presence of Mg ions. ATP participates directly as a reactant.

As shown in table 1, line 1, 14.4 μM of arginine (estimated as urea) and an equivalent amount of malic acid were formed from aspartic acid and citrulline in 20 minutes by an extract of beef liver acetone powder, subjected to one alcohol fractionation. When either citrulline or aspartic acid was omitted, neither arginine nor malic acid was formed.

Although ATP is specifically required, maximum rates cannot be reached with ATP alone, owing to competition by contaminating ATP-ase and to an inhibition caused by high concentrations of ATP. The difficulty can be overcome by employing 3-phosphoglyceric acid, in excess, as a source of high energy phosphate ($\sim\text{pH}$), and ATP in catalytic amounts, to effect the phosphate transfer. The glycolytic enzymes catalyzing the transfer of $\sim\text{pH}$ through phosphopyruvic acid and ADP are present in the preparation. When necessary their concentration was augmented by addition of a fraction from rabbit muscle extract. The dependence of arginine synthesis upon $\sim\text{pH}$ is shown in table 1, line 3, when phosphoglyceric acid was omitted, neither arginine nor malic acid was formed.

Glutamic acid could not replace aspartic acid (line 5) nor could any of some 20 other amino acids tried. With glutamic and oxaloacetic acids

(line 4) 7 μ M of arginine and malate were formed. The activity of this combination is due to the formation of aspartic acid by transamination. Assay of the glutamic-aspartic transaminase content of various preparations shows that the extent to which the combination of glutamic and oxalacetic acids will replace aspartic acid is proportional to the transaminase content of the preparation.

Aspartic acid cannot be replaced by NH_3 or by the combination of oxalacetic acid and NH_3 . It is

TABLE 1 SYNTHESIS OF ARGININE FROM CITRULLINE IN ALCOHOL FRACTIONATED EXTRACT OF OX LIVER ACETONE POWDER

Each tube contained in addition 4 μ M ATP, 13 μ M MgSO_4 , 0.4 ml phosphate buffer, pH 7.5, enzyme preparation containing 31 mg protein and 8 mg muscle extract in a final volume of 4 ml. Time 20 min, 38°.

SUBSTRATE ADDED					FOUND	
L-Aspartate 20 μ M	L-Glutamate 20 μ M	Oxalacetate 30 μ M	L-Citrulline 20 μ M	3 Phosphoglycerate 50 μ M	Arginine μ M	L-Malic acid μ M

+				+	0.0	0.0
+			+		0.9	1.0
	+	+	+	+	7.0	6.8
	+		+	+	0.0	0.0
	+	+		+	0.0	0.1
		+	+	+	0.0	0.2

particularly significant that in the absence of citrulline, no combination including oxalacetic acid gave rise to malic acid. For example, with oxalacetic and glutamic acids (line 6), malic acid would certainly have been formed by a glutamic dehydrogenase-malic dehydrogenase catalyzed dismutation (5) had diphosphopyridine nucleotide (DPN) been present. Under the given experimental conditions, malic acid cannot be formed independently of arginine.

The simultaneous formation of arginine and malic acid, by interaction of the two substrates, strongly suggests that the mechanism of nitrogen transfer involves a preliminary condensation of the amino group of aspartic acid with the ureido group of citrulline to form a C—NH—C linkage, followed by hydrolytic cleavage on the second side of the nitrogen, as shown in reactions 1a and 1b.

Regarding optical specificity of the overall reaction, only L-citrulline and L-aspartic acid react, while L-malic acid and L-arginine are formed. Identification of the products of the reaction has been established by isolation from a large-scale enzymatic run. L-Malic acid was isolated as the cinchonine salt and estimated quantitatively with the highly purified 'malic enzyme' described by Ochoa, Kornberg and Mehler (6). Since arginase was always present in excess, urea was estimated by the colorimetric method of Archibald (7) and L-ornithine was isolated as the dibenzoyl derivative.

Intermediary Condensation Product. The intermediary condensation product shown in reaction 1a is quite different from that postulated in keto-amino acid transamination. In the latter case, the reaction, however formulated (8-10), supposedly occurs through transient Schiff base formation, and the whole reaction is catalyzed by a single enzyme. Here the condensation product is depicted as an N,N' disubstituted guanidine and at least two enzymatically distinct steps are involved in the overall synthesis of arginine.

The two enzymes have been separated by ammonium sulfate fractionation of extracts of ox liver acetone powder, thus permitting a study of each step separately. In the first step (reaction 1a), ATP and Mg ion are specifically required. Urea formation from CO_2 and NH_3 is known to be endergonic. It may therefore be reasonably assumed that both citrulline and arginine synthesis are each endergonic, and that as far as arginine synthesis is concerned, it is precisely in the condensation reaction, that energy, supplied by ATP, is actually utilized.

Presumably, condensation occurs via a pre-

linumary phosphorylation. Although much information regarding the phosphorylation step is still lacking, phosphorylation of the isourea form of citrulline rather than of aspartic acid would appear more likely, for it would provide a means of shifting the citrulline equilibrium toward the more reactive isourea form.

Table 2 shows some of the experimental evidence for the stepwise reaction. Since phosphoglyceric acid was used as the source of \sim pH in the presence of condensing enzyme A, the amount of pyruvic acid formed, as well as the amount of inorganic phosphate, is a measure of the extent of \sim pH transfer. Citrulline disappears

TABLE 2 STEPWISE ENZYMIC FORMATION OF ARGININE

The conditions are as in table 1, line 1, except that muscle extract was omitted and glycylglycine buffer was substituted for phosphate. In the first step a solution of enzyme A containing 25 mg of protein was added to each tube. 38°, 20 min. After heat inactivation, enzyme B (18 mg protein per tube) was added. 38°, 20 min. The values are corrected for the small amounts of pyruvate and inorganic phosphate formed in the absence of citrulline.

	ENZYME A μ M	ENZYME B μ M
Citrulline removed	11.0	
Pyruvate formed	15.5	
Inorganic P formed	17.4	
Arginine formed	0.2	6.1
Malate formed	0.3	6.3

ance was found to be roughly equivalent to the amount of pyruvate and inorganic phosphate formed. The excess of these two over the amount of citrulline removed is undoubtedly due to competition with some contaminating ATP-ase. Neither arginine nor malic acid was formed, but the condensation product appeared to accumulate, for upon addition of the hydrolyzing enzyme B to the deproteinized reaction mixture, arginine and malic acid were formed in equivalent amounts.

About 50 mg of the intermediate have been accumulated in a large scale enzymatic run with enzyme A. By fractionation of the barium salt with alcohol, the intermediate has been freed of organic and inorganic phosphorous compounds originally present in the medium, and of citrulline, though traces of aspartic and pyruvic acids

remain. At this stage of purification, enzymatic cleavage to arginine and malic acid requires no further additions beyond enzyme B and the intermediate, thus confirming the formulation of reaction 1b as being purely hydrolytic.

Comparison of Arginine Synthesis in Slices, Homogenates, and Extracts. A comparison of the specific activity, expressed as Q_{urea} (μ l arginine or urea formed per mg protein per hour), of various liver preparations is given in table 3. The activity of crude extracts of ox liver acetone powder varies with the age of the powder. A preparation made from a powder after 4 weeks'

TABLE 3 SPECIFIC ACTIVITY OF VARIOUS LIVER PREPARATIONS

SPECIES	PREPARATION	CONDITIONS	Q_{urea}
Rat	Slice	NH ₄ , Lactate	18
	Homogenate	Glutamate ²	14
	Homogenate	Aspartate, pyruvate ²	16
	Acetone powder extract	Aspartate, \sim pH	18.8
	Acetone powder extract	Aspartate, \sim pH + muscle extr	20.2
Ox	Acetone powder extract	Aspartate, \sim pH	7.4
	Acetone powder extract	Aspartate, \sim pH + muscle extr	11.2
	EthOH fraction 3	Aspartate, \sim pH	7.8
	EthOH fraction 3	Aspartate, \sim pH + muscle extr	20.0
	EthOH fraction 4	Aspartate, \sim pH	17.9
	EthOH fraction 4	Aspartate, \sim pH + muscle extr	33.6

¹ Q_{urea} recalculated from the data of Krebs and Henseleit assuming 85% of the dry weight to be protein. ² Calculated from the rate of arginine synthesis per mg N given by Cohen and Hayano. ³ Calculated from the data in table 4, assuming 85% of the dry weight to be protein.

storage had a Q_{urea} of 7 which was increased to 11 by the addition of an extract of rabbit muscle, thus accelerating the rate of arginine synthesis to the point where only arginine synthesizing enzymes were limiting. On alcohol fractionation, a three-fold purification was reached in fraction 4 (Q_{urea} 33 with added muscle extract) corresponding to about 30 per cent alcohol.

Though much less stable, extracts of rat liver acetone powder have a higher specific activity. Under optimal conditions a Q_{urea} of 20 was found as compared to a Q_{urea} of 18 obtained by Krebs for rat liver slices, and a Q_{urea} of 14 obtained by Cohen and Hayano for rat liver homogenate in the presence of glutamic acid. In the presence of aspartic acid, supplemented with pyruvic acid

rat liver homogenates gave a somewhat higher Q_{urea} value of 16

On calculating the total activity of an extract of rat liver acetone powder, it appears that about 50 per cent of the original arginine synthesizing activity of the whole tissue can immediately be accounted for in the extract, without correction for destruction by acetone treatment or incompleteness of extraction, suggesting that the same enzyme system is involved regardless of the substrates offered or of other variations in experimental conditions

RELATIONSHIP OF THE TRICARBOXYLIC
CYCLE AND OF TRANSAMINASE TO
ARGININE SYNTHESIS

If, as studies on the anaerobic isolated system indicate, aspartic acid is the specific $-NH_2$ donor in arginine synthesis, then a number of questions are raised in relation to published observations concerning the following main points 1) Glutamic acid is four times as effective as aspartic acid in homogenates, aerobically (2, 11) 2) Both glutamic acid and aspartic acid are poor precursors in liver slices (1, 2) 3) The general mechanism of nitrogen transfer from amino acids to form aspartic acid, prior to arginine synthesis, is not immediately apparent

With regard to glutamic acid, an outline of the proposed enzymatic pathway is shown below where the rectangle is meant to represent the Krebs tricarboxylic cycle in highly schematized form, including only those intermediates of the cycle pertinent to the present discussion

In homogenates, aerobically, when glutamate is the $-NH_2$ donor, some of the glutamic acid is oxidized through glutamic dehydrogenase and the tricarboxylic cycle, to form oxalacetate. The latter is then converted to aspartate by transamination with a further amount of glutamate. ATP, generated by phosphorylations coupled with oxidation, is formed during these steps. From a quantitative point of view, it has been

shown by Ochoa (12) that the ratio of $\sim pH$ generated per atom of oxygen is 3.1, thus more than an ample supply would be provided for arginine synthesis. The oxygen requirement in liver homogenates, when glutamate is the NH_2 donor, must then be ascribed to dependence upon a) ATP generation and b) oxalacetate formation.

When aspartate is the NH_2 donor, in homogenates, arginine synthesis is poor because as-

TABLE 4. SYNTHESIS OF ARGININE FROM CITRULLINE IN RAT LIVER HOMOGENATES UNDER AEROBIC CONDITIONS IN THE ABSENCE AND PRESENCE OF MALONATE

In addition each vessel contained 20 μM L-citrulline, 5 μM ATP, 10 μM $MgSO_4$, 0.3 ml of 0.25M potassium phosphate, pH 7.5, 0.5 ml of 25% homogenate. Final volume 3.0 ml, 38° time 40 minutes. Calculated for 31 mg dry weight of tissue. The values are given in μM .

¹ Average deviation. ² 2.5 μM fumaric acid was added as a primer. Good respiration was often obtained without it, but the addition insured uniformly high values. Fumarate was not added to pyruvate when glutamate was employed nor was it added in any malonate experiment.

partic acid is oxidized very slowly and little, if any, oxalacetate is released to enter the tricarboxylic cycle. Sufficient ATP for arginine synthesis is therefore not made available, it being supplied directly only in catalytic amounts. If aspartic acid is supplemented by pyruvate, α -ketoglutarate, or any other member of the tricarboxylic cycle, arginine synthesis is increased to a high value. The values for oxygen uptake and arginine synthesis from aspartic acid, with and without the addition of various respiratory substrates, are given in table 4.

If when glutamate is offered aspartate must be formed by transamination, prior to arginine

synthesis, then it may be anticipated that whatever affects the concentration of aspartic acid, either directly through the transaminase equilibrium or secondarily, will affect the rate of arginine synthesis

Certain inhibitory effects reported from the laboratories of Borsook, Cohen, Krebs and Leuthardt may be explained on this basis. For example, the addition of α -ketoglutarate to glutamate (2, 11, 13) inhibits the rate of arginine synthesis about 40 to 60 per cent by pushing the transaminase equilibrium to the left, thus lowering the aspartate concentration (table 4)

Pyruvate exerts a similar inhibition (2, 3, 11, 13), by transamination with glutamic acid, some glutamate is removed and α -ketoglutarate formed. Both of these effects tend to diminish the aspartic acid concentration (table 4)

When aspartate is offered directly as the $-\text{NH}_2$ donor, the aspartate concentration is in excess, as far as enzyme saturation is concerned. Even if lowered from 20 to 15 μM by the addition of 20 μM of α -ketoglutarate, arginine synthesis will still be quite rapid (table 4)

Malonate also inhibits arginine synthesis from glutamate (2, 11, 14). This can readily be explained by the well-known block of α -ketoglutarate oxidation at the succinic dehydrogenase step, thus preventing the formation of oxalacetate. This explains why the addition of the latter or of a closely related precursor, such as fumaric or malic acids (14), specifically removes the inhibition (table 4). As is to be expected, the addition of malonate has practically no effect on arginine synthesis from aspartate under optimal conditions (*i.e.* in the presence of a respiratory substrate), for the rate of ATP generation, while excessive in the absence of malonate (see values for O_2 uptake in table 4) is sufficiently rapid even in the presence of malonate, to maintain a high rate of arginine synthesis.

Anaerobic Synthesis of Arginine in Homogenates
Once the requirements of the system are known, it is possible to obtain arginine synthesis in homogenates under anaerobic conditions by utilizing glycolytic reactions to generate $\sim\text{pH}$. Table 5 shows the amount of arginine formed in the presence of citrulline, aspartic acid and phosphoglyceric acid or hexose diphosphate. None was formed in the absence of a supply of $\sim\text{pH}$. The addition of phosphoglyceric acid, or of hexose diphosphate, caused no arginine formation when glutamate was substituted for aspartate, unless oxalacetate was also present.

Owing to the decreased efficiency of anaerobic, as compared to aerobic phosphorylation, competition with ATP-ase is less successful anaerobically. The rates of arginine synthesis were therefore much lower, anaerobically, than those obtained with an equal amount of homogenate in oxygen. A considerable portion of the ATP-ase present is associated with the suspended particles of the homogenate, and can be removed by high speed centrifugation. The last column of table 5 gives the values obtained in an equivalent

TABLE 5 SYNTHESIS OF ARGININE FROM CITRULLINE IN RAT LIVER HOMOGENATES UNDER ANAEROBIC CONDITIONS

Further additions and other conditions as in table 4 except that N_2 replaced O_2 in the gas space and 4 mg DPN was added to each vessel containing hexosediphosphate. The dry weight of 0.5 ml of homogenate and 0.4 ml of supernatant respectively were 34.7 mg and 17.1 mg. The values are given in μM .

SUBSTRATE ADDED					ARGININE FOUND	
L. Aspartate 20 μM	L. Glutamate 20 μM	Oxalacetate 30 μM	3 Phosphoglycerate 40 μM	Hexose diphosphate 25 μM	Whole homogenate	Supernatant
+			+		3.9	7.7
+				+	5.7	8.0
+					0.6	1.2
	+		+		0.1	0.0
	+			+	0.5	0.4
	+	+	+		4.6	6.8
	+	+		+	4.2	4.9

amount of supernatant, after removing the particles. Arginine when formed was found to be higher than in the whole homogenate in each case.

These experiments parallel the behavior of extracts of acetone powder. From the data in table 5, it may be seen that both the arginine synthesizing enzymes and transaminase are present in the supernate. This further supports the view that the particles were required only for the generation of ATP and of oxalacetate, when glutamate was the $-\text{NH}_2$ donor in the aerobic experiments.

Transfer of Amino Nitrogen to Oxalacetate
As to the general problem of $-\text{NH}_2$ transfer to form aspartic acid, tissue slice, isolated enzyme and isotope evidence (15-17) indicate that a good part of amino acid nitrogen probably goes through NH . However, there appears to be no known en-

zyme which oxidizes aspartic acid rapidly, comparable for example to glutamic dehydrogenase in activity and reversibility. Nevertheless rapid nitrogen transfer is possible by means of a combination of glutamic dehydrogenase and glutamic-aspartic transaminase, particularly under conditions where the newly formed aspartate can be continuously removed.

FIG 1 TRANSFER OF NH_3 to citrulline through aspartic acid by anaerobic dismutation and transamination in ox liver acetone powder extracts. Curve 1 malate, α -ketoglutarate dismutation. Curve 1a same as curve 1 in the absence of either DPN, NH_3 or malate. Curve 2 triosephosphate, α -ketoglutarate dismutation. Curve 2a same as curve 2 in the absence of either DPN, NH_3 or oxalacetate. Curve 3 arginine formation with aspartate in the same amount of extract. All tubes contained 4 μM ATP, 20 μM L-citrulline, 13 μM MgSO_4 , 0.4 ml of 0.25 M potassium phosphate pH 7.5 and 1.0 ml acetone powder extract in a final volume of 4 ml, temperature 38°. Further additions were: curve 1 20 μM each NH_4Cl and L-malate, 10 μM α -ketoglutarate, 50 μM 3-phosphoglyceric acid and 2 mg DPN. Curve 2 20 μM NH_4Cl , 10 μM α -ketoglutarate, 30 μM oxalacetate, 25 μM hexosediphosphate and 2 mg DPN. Curve 3 20 μM L-aspartate, 50 μM 3-phosphoglycerate.

The transfer of NH_3 to form aspartic acid has been carried out in extracts of ox liver acetone powder which contain these enzymes by means of dismutation reactions coupled with transamination.

FIG 2 PATHWAY OF AMINO NITROGEN TRANSFER to citrulline in urea synthesis and the relationship of the ornithine cycle to the tricarboxylic cycle.

In the first dismutation, malic acid undergoes a DPN linked dismutation with NH_3 and α -ketoglutarate, catalyzed by malic and glutamic dehydrogenases (reactions 1 and 2) resulting in the formation of oxalacetate and glutamate, which then transaminate (reaction 3) resulting in aspartate formation (reaction 4). In the presence of phosphoglycerate and citrulline, the amount of arginine formed becomes a measure of the rate of aspartate synthesis (fig 1, curve 1).

In the second dismutation, triosephosphate dehydrogenase (reaction 1a) replaced malic dehydrogenase. Starting with NH_3 , α -ketoglutarate, oxalacetate and hexosediphosphate (as the source of triosephosphate), aspartate will be formed as shown by reaction 4a. With the resulting diphosphoglycerate as the source of $\sim\text{pH}$, arginine was formed as shown in curve 2. The rate of arginine

formation in an equal amount of extract with aspartate and phosphoglycerate is shown in curve 3. Curves 1a and 2a represent blank values for the dismutations in the absence of NH_2 or DPN

PHYSIOLOGICAL PATHWAY OF AMINO NITROGEN TRANSFER IN UREA FORMATION

The individual steps in the aerobic transfer of nitrogen to form urea and then relationship to transaminase and to the tricarboxylic cycle of Krebs are summarized in figure 2

Citrulline formation from ornithine (Step E), which appears to require ATP generated by the tricarboxylic cycle, proceeds with carbamyl glutamate as the source of the ureido carbon, according to the most recently published work of Cohen and Grisolia (18). Citrulline is then converted to arginine (Step C) by a two-step reaction involving ATP (generated oxidatively) and aspartate, in the formation of an intermediate, which is then split to form arginine and malic acid.

In homogenates with glutamate as the $-\text{NH}_2$ source, the transfer of nitrogen will start by

transamination (Step B) with oxalacetate supplied by respiration.

In slices, NH_2 transfer will occur at Step A (glutamic dehydrogenase) and Step E. It has become apparent from recent studies on the permeability of liver slices that the poor activity of aspartic and glutamic acids is due to their slow rate of permeability. In the intact animal, NH_2 , arising from amino acid deamination will enter the cycle as with slices.

The scheme represents an expansion of the ornithine cycle of Krebs, connected with the Krebs tricarboxylic cycle by transaminase and by two simpler cycles, one which permits the catalytic turnover of α -ketoglutaric acid as a carrier of NH_2 by means of glutamic dehydrogenase, and the other which permits the malic acid (formed as the second product in arginine synthesis) to function, catalytically, in aspartic acid formation by means of malic dehydrogenase.

From studies on the isolated system and on homogenates, the scheme shown here appears to represent a major pathway of urea formation and accounts for most of the observations on slices and homogenates reported from other laboratories.

NUTRITION, RENAL LESIONS AND HYPERTENSION¹

CHARLES H BEST AND W STANLEY HARTROFT

From the University of Toronto

TORONTO, CANADA

PREVENTION of the accumulation of excess fat in the liver by dietary choline was demonstrated in our laboratories in 1932 using depancreatized dogs and normal rats (1). In 1939, Griffith and Wade (2) reported that in addition to fatty livers, weanling rats exhibited a fulminating, hemorrhagic lesion of the kidneys (fig 6). The occurrence of this syndrome was subsequently confirmed by Gyorgy and Goldblatt (3), by Engel and Salmon (4) and by Handler (5), and it has also been extensively studied in our laboratory. In 1947, Sobin and Landis (6) demonstrated that the blood pressure remained normal in young rats maintained on diets deficient in choline for as long as 7 months. We have confirmed these results by direct measurements in weanling rats exhibiting the syndrome of acute choline deficiency, and also in older animals which were given similar diets for longer periods. As an extension of these investigations, we have also studied the blood pressures in a third group of rats. These were fed the diet low in choline for 6 days at ages of 3 to 4 weeks, and this was then replaced by a fully normal food mixture for the remainder of the experimental period of 4 to 7 months. Of these animals, more than one-third developed a moderate or severe degree of hypertension during the period of observation.

RENAL LESION PRODUCED IN WEANLING RATS BY DIETARY CHOLINE DEFICIENCY

A brief outline of the changes which occur in the kidneys of weanling rats during the acute

stage of choline deficiency will be presented, for these lesions are presumably responsible for the elevation in the level of blood pressure which later develops in many of those animals which survive this initial period. Christensen (7) working with Griffith and Wade reported the pathology of the hemorrhagic renal syndrome. On gross examination, the kidneys are swollen and red and may attain weights twice the normal (fig 6). Christensen's histological investigations demonstrated the presence of a widespread tubular lesion throughout the renal cortices, associated with hemorrhage into and beneath the capsule (fig 7). Tubules in the outer portion of the cortex were necrotic and those lying more deeply were degenerated (fig 8). Hyaline casts filled the tubules at the cortico-medullary junction (fig 9). Stainable fat droplets were present in some of the cortical tubules. These observations were confirmed by Gyorgy and Goldblatt (3) who also emphasized the primary nature of the tubular lesions, for glomerular degeneration always followed the tubular necrosis as a secondary event.

The pathogenesis of these lesions has been the subject of detailed investigations in our laboratories (8). It was shown that the initial lesion demonstrable in the kidneys of weanling rats fed diets low in choline consists of the formation of small droplets of stainable fat within the epithelial cells of the proximal convoluted tubules of the cortex (figs 10 and 11). These droplets appear within 2 to 5 days of dietary choline deficiency. This is associated with generalized swelling of the affected nephrons. Evidence has been presented (8) which indicates that tubular swelling produces obstruction of the intervening cortical capillary plexus with resultant tubular ischemia and necrosis (figs

¹ Presented as part of the Symposium on Nutrition in Preventive Medicine, Detroit, Mich., April 21, 1949.

1 and 2) This mechanism has been termed tubular obstruction of capillaries (TOC) Proximal to the sites of capillary obstruction, the cortical vessels become engorged and rupture into and beneath the renal capsule (fig 7) This combination of parenchymal swelling and necrosis with associated capsular hemorrhage is responsible for the gross appearance of the kidneys The development of this lesion is necessarily accompanied by a reduction of the volume and extent of the renal vascular plexus in the cortex As glomeruli are destroyed in the later stages, their total numbers are accordingly reduced

PRODUCTION OF HYPERTENSION IN SURVIVORS OF THE HEMORRHAGIC RENAL SYNDROME

Methods Weanling albino rats of the Wistar strain (35-42 gm) were fed a diet very low in choline and its precursors² The object at this stage of the experiment was to produce the greatest degree of renal damage compatible with life A series of preliminary trials indicated that the optimum duration of dietary choline deficiency for this purpose was only 5 or 6 days Pair-fed control animals received the same basal diet supplemented with 0.35 per cent choline chloride At the end of this short period of choline deficiency,

the experimental group and also the controls were given a good stock diet which allowed excellent growth and development throughout the remaining 4 to 7 months of the experiment During this period, indirect determinations of the blood pressures of all animals were made at intervals by the method of Sobin (9) But the final assessment of arterial tension was based on direct measurement of blood pressure as indicated by a fine-bore mercury manometer connected with a 24-gauge needle inserted into the animal's femoral artery Following exsanguination and death, the heart was weighed to the nearest 1/100 gram in each case For comparative purposes, heart weight was expressed as a percentage of the total body weight Paraffin sections of kidneys, heart and other viscera were stained by a variety of methods On an histological basis, the animals were tabulated in three groups according to the amount of residual renal damage observed in microsections *slight*, *moderate* or *severe* The series included 62 animals which had survived varying degrees of the renal hemorrhagic syndrome and 36 controls of similar age and weight The controls had received the same diet as the test animals throughout the entire experiment, but were given a choline supplement during the initial 5- to 6-day period when the experimental groups were deprived of lipotropic factors

Results These are presented in graphic form (fig 5) Ten of the 62 experimental animals had suffered *severe* residual renal damage as demonstrated by microscopic examination The average blood pressure of this group was 195 mm Hg (systolic-diastolic mean) and their heart weights were nearly double the normal Thirteen rats had *moderate* degrees of renal damage, and of these, 11 had blood pressures of 150 mm Hg or over and were thus considered hypertensive, the average for the group was 165 mm Hg The average weight of the hearts of the animals which comprised this second group was approximately one-third greater than that of the controls (expressed as percentage of body weight) The third group, which consisted of the remaining 39 experimental rats, had suffered only *slight* degrees of residual renal damage, and the average of the levels of blood pressure in these animals was only a little higher than for the controls The blood pressure of all these control animals, with one exception, were lower than 140 mm Hg The average figure was 118 mm Hg

severe degrees of damage indicated extensive loss of both tubules and glomeruli (fig 12) Those which had escaped destruction were often greatly enlarged Casts filled most of the distended tubules (fig 13) Hyalinization in varying degrees was encountered in many glomeruli (figs 16 and 17) Preparations injected with india ink demonstrated that the glomerular capillary bed was most severely reduced in those animals which had developed the greatest elevation in blood pressure (figs 3 and 4) Arterial lesions were present which were very similar in nature to those which are associated with both benign and malignant phases of human hypertension (figs 18 to 21) In two of 10 rats with arteriolar necrosis, the level of non-protein nitrogen in the blood was determined and found in both instances to exceed 350 mg per cent No evidence of inflammatory disease could be demonstrated in sections of any of the hypertrophied hearts of the hypertensive animals

Discussion The renal lesions of the hypertensive animals were the result not only of the acute period of choline deficiency in early life, but probably also of the hypertension sustained during the last few weeks before death Such features as hyalinization of glomerular loops and thickening of Bowman's capsule are, in our opinion, most likely the result of high levels of intravascular pressure On the other hand, parenchymal loss is probably attributable to the preliminary period of acute dietary deficiency Experiments are now in progress, the results of which should help us to obtain a better understanding of the pathogenesis of these renal lesions

It has been suggested by Dr Handler (10) that fibrotic organization in the areas of capsular and subcapsular hemorrhages, which occur in the acute initial period of deficiency, might be a factor in the production of hypertension later in these animals Such a mechanism would be analogous to that which operates in rats which develop high levels of blood pressure after the kidneys have been wrapped with cellophane or silk (11) (fig 14) In a few of our animals, very slight proliferation of fibrous tissue had occurred in capsular areas (fig 12), but in most cases there was no evidence of abnormal amounts (fig 15) In the acute period of renal damage, however, the site of greatest necrosis is just beneath the capsule It is possible that this necrotic tissue may act like a thickened capsule, but until the entire problem of the pathogenesis of these kidney changes has been more intensively studied, fur-

ther discussion along these lines will not be attempted

The reduction of the renal cortical vasculature which has been demonstrated is probably a factor of prime importance in the development of hypertension in these experiments This would be comparable to that type of hypertension which develops in rats which have been subtotally nephrectomized (12) We have no evidence regarding the hormonal mechanisms involved, but presumably they would be similar to those operating in animals rendered hypertensive by the Goldblatt technique (13)*

Initial attempts to produce hypertension in rats by allowing them to survive the hemorrhagic renal syndrome of choline deficiency met with little success Large numbers of weanling animals were fed the deficient diet for periods as long as 10 days Only a few which were very resistant to this type of renal lesion survived Irreversible damage to the kidneys of a degree sufficient to influence the level of blood pressure in later life had apparently not been produced in these few hardy survivors, for hypertension did not develop and histological examination of the kidneys revealed few abnormalities In later experiments a greater measure of success was obtained by restricting the length of time the young animals were fed the low-choline diet to periods of only 5 or 6 days The greater number of animals which then survived included many with extensive renal damage A significant proportion of these survivors later developed hypertension when fed the normal food mixture

In the experiments conducted by Sobin and Landis (6) in which animals were deprived of dietary choline for long periods, the experimental conditions would also automatically tend to eliminate those rats which were most susceptible to this type of kidney damage Furthermore, the growth of survivors of the acute period of deficiency when left on low-choline diets, is less than if they are transferred to normal rations such as we have used Slower growth rats of survivors would be associated with lesser demands on the cardiovascular-renal systems in these animals, and thus taken together with only slight degrees of initial kidney damage would explain the apparent

* We have seen the hemorrhagic renal syndrome in an adult rat which after a period of undernutrition was placed on a choline-deficient diet We have not yet learned how to produce these lesions consistently in adult rats

discrepancies between our results and those of Sobin and Landis Dr Handler who has con-

which contains a greater percentage of protein than is contained in most choline-deficient food mixtures Our stock diets employed in the second phase of the experiments contained a normal amount of protein, which was of course a higher

FIG 1 (upper) APPEARANCE OF CORTICAL CAPILLARY PLEXUS in kidney of a normal weanling rat used as control The vascular system of the rat was injected with a filtered dilution of india ink introduced under physiological pressure into heparinized, anesthetized animal via left ventricle Slices of formalin-fixed kidney, 100 μ in thickness, were dehydrated in ascending strengths of alcohol and cleared in benzyl benzoate The dense plexus is so well injected that glomeruli are obscured

FIG 2 (lower) APPEARANCE OF CORTICAL CAPILLARY PLEXUS in kidney of a weanling rat fed basal diet deficient in choline for a period of 5 days The technique of demonstration was identical with that described above for fig 1 Note failure of injection mass to penetrate terminal portions of plexus which supply the periphery of each renal lobule In stained sections, the tubules in the ischemic regions were necrotic The mechanism by which this type of regional capillary ischemia is produced has been designated TOC—tubular obstruction of the capillaries The evidence, which has been presented in detail elsewhere (8), indicates that initial lesion in development of hemorrhagic renal syndrome consists of appearance of striable fat in epithelium of the tubules which, at the same time, become swollen Pressure is thus exerted on capillaries which lie between affected tubules and results in vascular occlusion—TOC

firmed our findings (10) has suggested a further explanation He feels that to produce hypertension, it is necessary to feed the survivors a diet

FIG 3 (upper) APPEARANCE OF CORTICAL CAPILLARY PLEXUS in kidney of an adult rat which belonged to the control group With age, tubules have increased in size so that capillary plexus is separated and not sufficiently dense to obscure glomeruli which also are larger than those in weanling rat illustrated in fig 1 Techniques employed for preparing and photographing the specimen are the same as those outlined for fig 1

FIG 4 (lower) APPEARANCE OF CORTICAL CAPILLARY PLEXUS in kidney of an adult rat which developed a malignant type of hypertension The animal belonged to the experimental group which was fed choline-deficient diet for 6 days followed by a full normal diet until time of death several months later Note obvious reduction in number of glomeruli Technical details are the same as described for fig 1

level than that in the basal choline-deficient ration

Selye (14) Krakower and Hemo (15) and Lenel *et al* (16) have demonstrated the inter-related roles of the adrenal cortex, the kidney and of dietary salt in the production of hypertension in chickens Deane and Olson (17) have shown that there is hypertrophy of the adrenal cortex in weanling rats which exhibit the syndrome of

hemorrhagic kidney. It is possible that this hypertrophy may contribute in some manner to the development of hypertension in animals surviving the syndrome. A normal amount of salt was present in the diets we employed, but further investigations along these lines are possibly indicated.

Calder (18a, 18b) has reported experiments in which a slight rise in the level of arterial pressure apparently occurred in rats which had been fed diets partially or completely deficient in the heat-

weeks on low-choline diets. As previously pointed out, Sobin and Landis (6) were unable to demonstrate alterations in the blood pressures of such

FIG 5 COMPARISON OF HEART WEIGHTS AND SYSTOLIC-DIASTOLIC LEVELS of blood pressure (direct method of measurement) in the 4 groups of rats which totalled 98 in number. The upper limits of the bars indicate average levels of blood pressure for each group according to the scale on the left. The shorter, cross hatched portion of each bar indicates for each group the average heart weight expressed as a percentage of body weight, according to the scale on the right. The number of rats in various groups is stated above each column. The animals were selected according to degree of parenchymal damage indicated at base of each column after assessment of microsections of kidneys.

stable fractions of the vitamin B complex. He found an average difference in blood pressure of 23 mm Hg between the rats in his experimental and control groups, as determined by direct measurements taken by cannulation of the abdominal aorta. The levels of blood pressure of his experimental animals (direct readings) averaged only 144 mm Hg. Calder did not report the cardiac weights of the animals in these experiments. Although he describes lesions of the renal parenchyma and thickening of both the arteries and arterioles with hyaline degeneration of the latter, his photomicrographs suggest that these changes were very slight. The parenchymal lesions resemble minor degrees of those which have been produced (8) in young adult rats maintained for several

FIG 6 APPEARANCE ON GROSS EXAMINATION of kidneys and liver (below) of a weanling rat fed the basal diet low in choline for a period of 7 days. Similar organs from a control rat pair fed the basal diet supplemented with choline during the same period are included (above) for comparison. The scale at right is in centimeters. Note increase in size of these organs of the experimental animal, the pale appearance of its fatty liver and the dark hue of its kidneys which were dusky red.

animals, and our investigations have confirmed theirs. The degree of hypertension reported by Calder is comparable perhaps to that which developed in the animals in our experiments which

comprised the group with only slight renal damage. Few of these animals were grouped as hyper-

it will require further work to decide whether or not choline deficiency is the responsible factor. In the meantime, it cannot be considered established that a significant hypertension can be produced by Calder's procedure.

FIG 10 THE LESION which is initially demonstrable in course of development of renal hemorrhagic syndrome of choline-deficient weanling rats consists of appearance of small sudanophilic droplets in epithelium of proximal convoluted tubules which become swollen and compress intervening capillaries. The fat droplets appear as small black dots in the photograph. Frozen section of renal cortex from a weanling rat fed the choline-deficient diet for 2 days, Sudan IV and hematoxylin, Wratten G and H filters, $\times 100$.

tensive, as in our experiments only those with levels of blood pressure (systolic-diastolic averages) of 150 mm Hg or more were so designated. If Calder's findings are confirmed and extended,

The method of producing experimental hypertension in rats by short periods of dietary choline deficiency in early life is one which may introduce less complications than do procedures such as injection of nephrotoxic sera, or those involving

FIG 18 EXAMPLES OF 2 NORMAL ARTERIOLES IN renal cortices of kidneys of rats belonging to the control group Compare with figs 19, 20 and 21 Hematoxylin and eosin stain, $\times 300$

FIG 19 EARLY CELLULAR HYPERPLASIA OF ARTERIOLES in kidney of a rat surviving the hemorrhagic renal syndrome with only a *slight* degree of parenchymal damage This animal's blood pressure (systolic/diastolic average measured by a direct method) at the time it was killed was 150 mm Hg Hematoxylin and eosin stain, $\times 300$

FIG 20 HYALINE DEGENERATION WITH A SUGGESTION OF EARLY NECROSIS in a cortical arteriole in kidney of rat surviving the hemorrhagic renal syndrome with a *moderate* degree of parenchymal damage Blood pressure measured 170 mm Hg (systolic/diastolic average) Hematoxylin and eosin stain, $\times 300$

FIG 21 ADVANCED FIBRINOID NECROSIS OF AN ARTERIOLE in the renal cortex of a rat surviving a brief period of acute dietary choline deficiency in early life with a *severe* degree of parenchymal damage Blood pressure measured 210 mm Hg (systolic/diastolic average) Hematoxylin and eosin stain, $\times 300$

operations such as laparotomy The only difference in the treatment of the animals of our control

series and those in which hypertension was produced lay in the withholding of less than 0.02 grams of choline chloride from the diets of the latter for a brief period of 5 or 6 days

Our findings and those of Sobin and Landis have indicated that if young rats which have survived the hemorrhagic renal syndrome are maintained on diets deficient in choline throughout the entire experimental period, hypertension will not be produced If however, choline and its precursors (including protein) are restored to the diet after kidney damage has occurred, malignant hypertension may develop in later life We have already suggested that an important factor in explaining the absence of hypertension in the first instance may be the slow rate of growth which occurs in this group of animals The demands on the damaged cardiovascular system in these rats would be correspondingly lessened and renal metabolism would presumably be at a lower level because of the low percentage of protein in the deficient type of diet The relative importance of these various factors in the etiology of the hypertension we have produced is a subject of investigations we are planning to pursue

An important outcome of this work is the proof that extensive, and often fatal, pathological changes during adult life may have their origin in a very short period of dietary abnormality in infancy Correction of the abnormality during adult life, under certain conditions, may lead to pathological changes (hypertension in the present instance) which would otherwise not have occurred These findings suggest that the later effects of lesions produced by other dietary deficiencies in very young animals may prove a fruitful field of investigation which may yield the investigator a rich harvest

The nutritional aspects of this work have been made possible by a grant from the Nutrition Foundation, New York The histological studies were supported by the National Research Council of Canada

We are indebted to Dr Jessie H Ridout for a great deal of help with the diets The technical assistance of D H Beaton and W D Wilson in the histological work is gratefully acknowledged

American Association of Immunologists

Symposium on Mechanisms of Immunity to Viruses

Chairman JOSEPH W BEARD

DISTRIBUTION OF ANTIBODY TO POLIOMYELITIS IN VACCINATED AND PARALYTIC MONKEYS¹

ISABEL M MORGAN

From the Poliomyelitis Research Center, Department of Epidemiology, Johns Hopkins University

BALTIMORE, MARYLAND

THE study of immunity to poliomyelitis has taken on new interest since finding that, by intramuscular vaccination with active poliomyelitis virus, the majority of monkeys can be rendered immune to intracerebral challenge with large doses of active virus (1). This method has been effective in differentiating types of poliomyelitis virus (2, 3) as well as instrumental in studying immunogenesis of poliomyelitis. I plan to discuss the immune response to poliomyelitis in monkeys induced by a variety of exposures to virus.

The distribution of antibody in and out of the central nervous system in vaccinated animals has already been contrasted with that in paralyzed animals (4). These data will be reviewed and more recent observations will be presented on antibody distribution in vaccinated animals which have been challenged intracerebrally with various infectious and non-infectious nervous tissue suspensions.

Table 1 gives the distribution of antibody in fluids and CNS tissues of monkeys vaccinated with or paralyzed by Lansing virus.

The rhesus monkeys in the first group were vaccinated 4 to 6 times intramuscularly with 1 cc doses of 10 per cent Lansing infected monkey spinal cord. At 6 weeks, spinal fluid and blood were taken. After perfusion with sterile saline solution, the monkeys were killed. The thalamus, cervical and lumbar enlargements of the spinal cord and the visual cortex were saved. The thalamus was of interest as the region of inoculation,

and, like the anterior horn, a susceptible area. The visual cortex was selected as a non-susceptible area of gray matter. The spinal cord enlargements frozen on dry ice were quartered longitudinally and from the anterior quadrants the white matter was scraped away leaving sticks of gray matter. A single layer of gray matter was obtained from a flattened, frozen piece of visual cortex by scraping away the adjacent layers of white and gray matter. Suspensions of these tissues at a 1/32 dilution in saline were made in a TenBroeck tissue grinder. Further 10-fold dilutions were made from these. Each tissue and fluid was titrated by intracerebral mouse neutralization test, in the presence of 10 LD₅₀ of Lansing virus.

From table 1 it can be seen that in 8 vaccinated monkeys, serum titers arranged in decreasing order ranged from high to moderate titers (titers of 30-38 are maximum in our experience). Yet no antibody was demonstrable in spinal fluid or the parts of the CNS saved. The titers recorded as <1 indicate that from 3 to 5 mice were spared of the group of 8 which received the 1/32 dilution of nervous tissue and virus. The sparing of a few mice is inadequate to establish either a true neutralization or a negative result and is therefore recorded as <1. Tests with many of these tissues which yielded borderline results have been repeated and again yielded an indefinite result.

The next group in table 1 of 11 monkeys which were paralyzed as a result of intracerebral injection of Lansing virus were also studied for antibody distribution in the same tissues (except for thalamus). A marked contrast to the vaccinated group is apparent. The highest titers appeared in

¹ Aided by a grant from The National Foundation for Infantile Paralysis, Inc.

the anterior horn of these convalescents, killed from 16 days to 5 months after onset of paralysis. Serum titers approximated those of the spinal fluid (suggesting a spilling over of antibody from the affected regions of the CNS) whereas no antibody was demonstrable in the visual cortex. The levels in the anterior horn were in most instances 10- to 100-fold greater than those in the fluids

¹Neg log 50% endpoint by mouse neutralization test

The last group of 4 individuals in table 1 were killed 3-7 weeks after onset of paralysis incited by Brunhilde virus. No antibody to Lansing virus was demonstrable in the anterior horn of the spinal cord. The Brunhilde strain of virus is known to be immunologically distinct from Lansing virus as shown by reciprocal immunity tests in vaccinated animals. However, a cross-relationship among poliomyelitis viruses is demonstrable by reinoculation of paralytic convalescent monkeys. Such animals are 100 per cent immune to the

same virus as that with which they were vaccinated or to another poliomyelitis virus of the same immunological type. On the other hand, they are not fully susceptible to poliomyelitis virus of a different immunological type. For example, about half of a Brunhilde-convalescent group resists an intracerebral injection of a large dose of Lansing virus and vice versa (5). Just what is the basis of this relationship we do not know. The negative result presented here fails to throw light on the question.

Having found that in vaccinated animals antibody is found primarily in the blood stream, and that with sufficiently high level of antibody such individuals are immune to intracerebral injection of large doses of homologous virus, I was interested to find what the distribution of antibody would be after such intracerebral challenge. Accordingly, 6 Lansing-vaccinated monkeys which proved immune to intracerebral injection of 10,000 LD₅₀ of Lansing virus were bled, tapped for spinal fluid, perfused with sterile saline and killed for study.

They appear as the first group in table 2. It

can be seen that they had moderate to high levels of serum antibody. The majority had antibody in the spinal fluid at a somewhat lower level. Within the CNS, antibody levels of the thalamus approximated those of the serum, but what is more remarkable was the finding of antibody in the majority of individuals in distant parts of the CNS, viz., the anterior horn and visual cortex. (No antibody was demonstrable in the anterior horn of the 2 individuals with the lowest serum antibody levels.) This finding immediately raises the question of whether the virus incited infection. In three individuals (E422 series) the spinal cord was examined histologically at levels T₂ and L₁ and one (E422) was found to have had inapparent infection. However, the pattern of antibody in this individual was no different from that in the others (with the possible exception of an outstanding concentration in the thalamus). In a larger series of 23 monkeys, vaccinated with and immune to intracerebral injection of Lansing virus, from which the medulla and spinal cord at levels C7 and L7 were examined, this individual alone showed evidence of infection. Thus the immunity of the vaccinated animal as a rule does not depend on CNS infection. It is fascinating to speculate on what may account for this antibody response at remote parts of the CNS. Either it is simply an immune response to introduction of antigen, perhaps as a secondary stimulus, or possibly the antigen as active virus exerts some immunogenic effect beyond what an inactivated preparation would, in spite of no histological evidence of infection. Against the latter hypothesis is the fact that antibody response seems to be universal through the CNS, and not confined to the susceptible areas. The effect of injection of inactivated virus intracerebrally has not been studied. Another control has been done, however, on the effect of intracerebral injection of normal CNS tissue suspension in vaccinated animals. This group of 5 monkeys appears at the bottom of table 2. With moderately high serum antibody levels, they had no antibody definitely demonstrable in the CNS, with the possible exception of the anterior horn of one individual (no material was available to repeat this test). This control serves to establish that the injection of CNS tissue (with the hemorrhage and ensuing local inflammatory reaction) does not in itself introduce anti-poliomyelitic neutralizing substance into the CNS.

Another line of attack is the effect of heterotypic poliomyelitic virus infection in Lansing-

vaccinated animals. This approach was thought of in connection with the question of whether the antibody in the affected areas of CNS in a Lansing paralyzed animal was developed locally or represented an accumulation of antibody produced elsewhere. The second and third groups of animals in table 2 bear on this point. The monkeys in both groups were vaccinated intramuscularly with Lansing virus, and challenged subsequently with Minnesota virus. In one group, they received an intervening Lansing challenge. In the group which failed to have this homologous challenge, one individual (D923) had such low titer of circulating antibody that it probably would not have passed such a challenge and is therefore not comparable to the others. The other 7 individuals showed moderate to high levels of antibody in the anterior horn of the spinal cord and in this regard are comparable to Lansing paralytic animals. The two individuals in which thalamus was tested showed equally high levels of antibody there, with lower levels in the spinal fluid. These findings support the contention that antibody may accumulate in the CNS in response to an inflammation reaction. This is perhaps opposed to the hypothesis which I have proposed of local formation of antibody in the affected parts of the CNS. There is one factor, however, which must be looked into further, and that is the question of possible antigenic relationship of these two poliomyelitis viruses. We now know they are sufficiently distinct immunologically to be considered two types, but to what degree there is a relationship we have not yet sufficient quantitative data to know. This problem recalls the resistance of approximately 50 per cent paralytic convalescent animals to reinfection with heterotypic virus. But as yet there is no immunological evidence to account for this resistance.

To summarize, Lansing paralytic convalescent monkeys have highest antibody levels in the affected parts of the CNS, in contrast to vaccinated animals in which antibody is demonstrable in the serum but not in the CNS. If circulating antibody is sufficiently high in such vaccinated individuals, they are immune to intracerebral injection of a large dose of homologous virus. In response to such injection of virus, antibody appears throughout the nervous system, even in distant, insusceptible areas.

Monkeys paralyzed with one poliomyelitis virus show no demonstrable antibody in the anterior horn of the spinal cord to a heterotypic virus. Nevertheless, monkeys vaccinated with one virus

and paralyzed with a heterotypic polomyelitis virus acquire in the anterior horn high levels of neutralizing antibody to the virus with which they were vaccinated

Does this suggest that antigenic stimulus with any polomyelitis virus within the CNS in an

animal already vaccinated with a polomyelitis virus renders the entire CNS immune? Since this stimulus has not yet been given in the form of inactivated virus, it is all too obvious how many steps will have to be taken before dreaming of any practical application of such an idea to man

LOCAL IMMUNE RESPONSE AND VIRAL GROWTH RATE AS FACTORS IN IMMUNITY TO EQUINE ENCEPHALOMYELITIS VIRUS

R. WALTER SCHLESINGER

*From the Division of Infectious Diseases, The Public Health Research Institute
of the City of New York, Inc*

NEW YORK CITY

THIS discussion will be limited to a brief review of recent studies on the mechanism of acquired active immunity of mice to intracerebral challenge doses of equine encephalomyelitis (E E) virus (1, 2). These studies were the outgrowth of earlier work on the possible significance of humoral factors, specifically neutralizing antibody, in relation to resistance to infection.

Previous efforts to establish or rule out the existence of a quantitative correlation between antibody titers and resistance to infection with E E or other viruses were limited, by and large, to the antibody present at the time of exposure to the infecting dose of virus. This approach has yielded inconsistent or inconclusive results. It was suggested that the relatively high titers of neutralizing antibody in the serum, which appeared to be associated with resistance to intracerebral challenge doses of E E virus (3, 4), reflected the presence within the central nervous system of antibody in adequate concentration. This suggestion was based on the finding (4, 5) that antibody in actively or passively immunized animals was distributed between serum and the central nervous system at a ratio of 100/1 to 300/1. Two observations made it clear, however, that such a concept of immunity as a static function of serum antibody titer was untenable. a) In immunized guinea pigs which had survived an intracerebral challenge dose the serum/brain ratio was altered as a result of a disproportionate increase in neutralizing titer of brain tissue (6). b) The degree of resistance of mice vaccinated with formalinized Western E E virus was found to vary with the use of different strains of this virus as challenge inoculum (7). In particular, mice which following vaccination were resistant to certain strains were not or only partially protected against the 'R I' strain. This was true even for mice immunized

with vaccines prepared from the R I strain itself. Since it was not possible to show serological differences between the R I and the other strains, it was of interest to investigate the nature of this phenomenon.

One point of distinction between the R I and the other strains was that the former had undergone numerous brain-to-brain passages in mice. In the course of this procedure it had acquired the ability to kill mice in about one half of the time required by comparable amounts of the less well adapted strains.

Comparison of the rates of multiplication in the mouse brain of the 'fast' R I strain and a representative 'slow' strain (Kelser) has revealed differences corresponding to their relative rapidity of action. The belief that increase in the rate of viral multiplication is responsible for the difference in response of immunized mice to the R I and the Kelser strains has been strengthened by the finding that the latter, after 37 additional rapid brain-to-brain passages, simulated the R I strain in rapidity of action, and that vaccinated mice were significantly more resistant to the 'slow' parent strain than to its 'fast' derivative.

The difference in response to the two strains was not demonstrable in mice vaccinated with large doses of inactivated virus. By reducing the dosage of vaccine, a level of immunity could be induced at which all of the mice challenged with 10^5 LD₅₀ of the 'slow' strain would survive, while those challenged with the same amount of the 'fast' strain would succumb.

When the fate of the two virus strains in the brains of mice so treated was studied, the following difference was found: the R I strain multiplied at about the same rate in vaccinated as in normal mice. The Kelser strain, to which the vaccinated mice were immune, also multiplied, but at a slower rate than in normal mice. The maxi-

imum increase was about 100-fold over the amount found at 3 hours after inoculation, and virus persisted at the higher level for as long as 4 days after inoculation. No virus was demonstrable under these conditions in brains harvested on or after the 5th day.

Further tests were predicated on the assumption that a local immune response, stimulated by the challenge inoculum, could compete successfully with the slowly multiplying strain but not with the fast R I strain. It was found that brains in which virus was no longer detectable (i.e., in the experiment just described, those harvested from the 5th day on) were capable of neutralizing virus. The neutralizing titer of brain tissue increased markedly, reaching a maximum level after about 10 days and maintaining it for at least 4 months. As a result, the serum/brain ratio of neutralizing titers was reduced from a 'physiological' value of about 200/1 to less than 10/1.

The magnitude of this shift in serum/brain ratio depended inversely on the degree of pre-challenge immunity. One may assume that intensive vaccination by itself stimulated a primary immune response sufficient to render part of the intracerebral inoculum inert as antigen. This fits in with the observation already mentioned that the difference in response to challenge with 'slow' and 'fast' strains was not demonstrable in mice vaccinated with large doses of inactive virus.

The view that the increase in neutralizing titer of brain tissue is due to the antigenic booster action of the intracerebral inoculum finds indirect support in the observation that mice vaccinated with the smallest immunogenic amounts of vaccine were protected against large amounts, as much as 10^5 LD₅₀, but only partially resistant to about 10 to 100 LD₅₀ of the 'slow' strain. Comparative studies on the rate of viral multiplication after intracerebral inoculation of varying amounts have yielded converging curves for large seed inocula and more closely parallel curves for small amounts. This has been interpreted as indicating that after inoculation of large amounts only a fraction of the inoculum is utilized in the initiation of infection, leaving the bulk free to act as antigen. Small inocula, on the other hand, are presumably taken up quantitatively by susceptible cells, leaving no virus available as free antigen. Hence, while in animals 'sensitized' by extremely low-grade immunization there is no adequate primary immune response to overcome small challenge doses, large doses exert an anam-

netic booster effect resulting in the animal's survival. This type of 'paradoxical response' has also been described for other infections, notably in the case of rabies virus where standard potency tests on vaccines involve intracerebral challenge inoculations in immunized mice (8, 9). It may be responsible for misleading results, especially when the challenge test does not include the entire range of effective virus dilutions.

The conclusion that the virus-inactivating substance present in brain tissue is neutralizing antibody is based on the following evidence: a) The reduction in serum/brain ratio of neutralizing titers following challenge is paralleled by similar changes in the ratio of titers of complement-fixing antibody. b) It is specific. In animals vaccinated with a mixture of inactive Western and Eastern E E viruses and challenged with active virus of either type, the relative concentration of the homologous, but not of the heterologous, antibody in brain tissue rises. c) Like antibody in the serum, it follows the 'percentage law' on dilution of underneutralized mixtures.

It may be said, then, that the fate of a vaccinated animal after intracerebral challenge inoculation of E E virus depends on a variety of factors. Death or complete protection are not the only alternatives. Even in the immune, surviving animal, the challenge virus may multiply and persist at high levels for several days. Except for hyperimmunized mice, the decisive factor appears to be the more effective force in a competition between rate of viral multiplication and intensity of local immune response. The latter, in turn, is determined not only by the degree of 'sensitization' acquired with vaccination but also by the size of the challenge inoculum. The term 'sensitization' is used in this connection as denoting an increase in the potential ability of the immunized animal to respond locally to the antigenic stimulus of the intracerebral inoculum. It is chiefly this increase by which mice vaccinated with relatively small doses of inactive virus differ from normal animals.

It is not intended to suggest that mechanisms as complex as the one postulated here apply to other virus-host systems. It must be remembered that the artefact of an intracerebral inoculation is associated with extensive trauma in the immediate vicinity of susceptible cells. The inoculum, moreover, presumably is diffused throughout the closed system of the central nervous system. Thus, if it contains a large excess of virus which

does not participate in initiating infection, this excess is free to act as antigen wherever cellular elements involved in the immune response are exposed to it. It is conceivable that the mechanism of immunity may not involve all of the

factors mentioned to the same extent in those infections, for example, in which the virus acts directly on exposed surface cells or in which the site of inoculation is removed from the susceptible tissue.

REMARKS ON CELLULAR RESISTANCE TO MAMMALIAN VIRUSES¹

JOHN F. ENDERS

From the Harvard Medical School and The Children's Medical Center

BOSTON, MASSACHUSETTS

INTEREST arose in the theory of cellular immunity as applied to viral infections when it became apparent that this class of pathogens could multiply only in close association with living cells—indeed probably only within the confines of the cell membrane itself. With the establishment of this fact the obvious deduction was drawn that these pathogens were particularly fitted to elicit an immune response dependent exclusively upon the development of intracellular antiviral factors. This inference has led to numerous experimental attempts to obtain evidence of acquired cellular immunity to viruses. To a few of the more significant of these I shall refer toward the end of this paper. It may be stated at once, however, that they have not provided an unequivocal answer to the problem. At present, the available evidence permits merely the assessment of the probability that this phenomenon may occur.

In contrast to the doubtful status of acquired cellular immunity, the evidence for the existence of natural or innate resistance of cells to infection by viruses is convincing. I shall therefore review this evidence in some detail, especially that which has been gained through studies in tissue cultures. Before doing so, I shall define the concept of cellular resistance which I have followed in the selection of the material.

Cellular resistance depends upon an intrinsic or acquired property or properties of the cell, which independent of factors in the body fluids may prevent the multiplication of a virus or destroy its activity. Obviously this definition is extremely broad and would include such non-specific and non-immunologic properties as an impermeable cell membrane or the absence of an enzyme system. To embrace, however, the phenomena of natural immunity to viruses such breadth of definition is clearly essential.

NATURAL OR INNATE CELLULAR RESISTANCE

Factors other than the activity of cells which might be responsible for natural resistance. At the outset we may appropriately consider the possibility that certain non-cellular factors could be responsible for the natural resistance of certain species. To do so will serve to reveal the dominant position of the cell in this type of immunity. Such factors may be grouped under three headings: 1) non-specific antiviral effects of plasma, or other body fluids which are destroyed by moderate heating, 2) thermostable virus-neutralizing substances, 3) physical conditions incompatible with survival or multiplication of the virus.

In respect to the first of these, data exist which indicate clearly that fresh unheated serum from normal susceptible animals may inactivate or restrict the multiplication of a virus if mixed with it and then inoculated. For example, Douglas and Smith (1) found that fresh rabbit serum mixed with vaccinia virus and then inoculated intradermally into rabbits definitely modified the development of the lesion. We have also observed, in unpublished experiments, that fresh rabbit and cat sera added to small amounts of vaccinia virus reduce the size and number of pocks which subsequently develop on the chorioallantoic membrane of chick embryos. Recently Leymaster and Ward (2) in a study of the augmenting effect of complement on mumps neutralizing antibody found that undiluted or slightly diluted unheated sera of normal monkeys and presumably susceptible human beings were capable of preventing infection of chick embryos by the mumps virus.

Although such observations are worthy of note for those engaged in the demonstration and titration of virus neutralizing antibodies, one cannot regard the antiviral effect *in vitro* of unheated normal serum as playing a significant part in natural resistance. For it is obvious, as in the case of anthrax, that there is no correlation be-

¹ Presented as part of the Symposium on Mechanisms of Immunity to Viruses, Detroit, Mich., April 20, 1949.

tween host susceptibility and the capacity of the serum *in vitro* to inhibit the virus

A purely physical factor, the normal temperature of the body, may render some species naturally resistant to attack by certain viruses. Dr. Pearson and I (3) a few years ago obtained evidence that the striking difference between the high susceptibility of the chick embryo and the complete resistance of the newly hatched chick to infection with the Melbourne strain of influenza A virus was adequately accounted for by the difference in temperature of the two hosts. Subsequently McLean and his co-workers (4) likewise found that the multiplication of a strain of influenza B virus was markedly inhibited at temperatures corresponding to the body temperature of birds. I am not aware that similar studies have been made with other viruses such as those causing equine encephalomyelitis which are highly virulent for the chick embryo but to which the fowl is almost or completely resistant. Such investigations, though, would be of value in assessing the general importance of a high body temperature in the natural resistance of the fowl to many mammalian viruses as compared with that of its embryo.

In addition to these three classes of non-cellular factors, one can conjecture that other conditions such as an unusually high hydrogen-ion concentration of the saliva or the presence of antagonistic micro-organisms in the flora of the nose, the throat or the gastrointestinal tract might arrest or destroy certain viruses at their portal of entry. In general, however, it would seem, that with the exception of differences in normal body temperature, non-cellular factors are of little significance.

Evidence that cellular resistance is the principal factor in natural immunity. By exclusion, then, one arrives at the tissue cells as the major factor in natural resistance to viruses. Moreover, a great deal of evidence—far too much to be reviewed here—of a more direct character has been accumulated through studies of the behavior of viruses in living animals especially in regard to the type of cell which is injured and the organ or tissue in which multiplication occurs. From certain points of view even more convincing than these observations made *in vivo* are the results obtained by tissue culture techniques. Since I have been interested for some time in these methods and since the time is limited, I shall confine my remarks mainly to a review of the

results so obtained in respect to the problems under discussion. In their evaluation, however, one should bear in mind, that, as Beard and Rous (5) have said, the physiological isolation inevitable to all cultivation *in vitro* is not always an advantage from the experimental point of view.

When directed to the investigation of natural cellular immunity the tissue culture technique has shown that in most cases in which adult tissues have been employed the growth or failure of growth of a given virus *in vitro* is correlated with susceptibility or resistance *in vivo*. So far, I believe, lack of such correlation has been observed only when the resistance *in vitro* of embryonic tissues has been compared with that of the living adult of the same or another species. In these instances where embryonic tissues have proved susceptible and the living adult relatively resistant, it is possible that differences in the properties of the cells may be involved. But before this conclusion can be accepted, the effect of non-cellular factors such as a more elevated body temperature of the adult must be eliminated.

Examples of correlation between natural resistance *in vivo* and *in vitro* have been described by Andrewes (6) and by Ivanovics and Hyde (7) in the case of Virus III infections of rabbits. The same relationship has been demonstrated by Andrewes (8) for the salivary gland virus of guinea pigs. Hallauer (9) who has reviewed the literature up to 1939 cites experiments of Frenkel and van Waveren who found that the virus of foot and mouth disease can only be cultivated in the tissues of susceptible species such as the cow, sheep and the guinea pig. Findlay (10) was able to obtain multiplication of fowl pox only in tissues of susceptible birds. A particularly good instance of agreement between host resistance and the *in vitro* behavior of the cells is to be found in the studies of Hallauer (9) on different strains of fowl plague virus. He was unable to propagate in mouse embryonic tissues a strain to which mice were entirely refractory, although he succeeded easily when he used chick embryonic tissue. On the other hand, working with two strains which induced infection in mice as well as in fowl, he was able to cultivate both agents in cultures of mouse tissue as well as in those composed of chicken cells. Sabin and Olitsky (12) succeeded in growing a strain of human poliomyelitis only in cultures consisting of human embryonic brain

fragments. The virus rapidly disappeared from cultures of chicken or rabbit nervous tissues. Employing the Lansing strain of poliomyelitis virus we have recently confirmed the findings of Sabin and Olitsky in respect to growth in human nervous tissues (13). As yet, however, we have been unable to obtain evidence of the multiplication of this virus in fragments of mouse brain. Since the Lansing strain is pathogenic for mice, this unexpected finding might appear as an exception to the general correlation between *in vivo* and *in vitro* susceptibility. But there may well be other reasons for this discrepancy.

The difference in resistance to a number of viruses of various types of cells derived from the same host species has also been investigated by means of tissue cultures. Unfortunately there have been few studies in which pure cultures of cells have been employed. They are sufficient, however, to establish the fact that some viruses can multiply only in certain cell types. Thus Carrel (14) as early as 1926 showed that the Rous sarcoma virus failed to proliferate in cultures of chick fibroblasts but actively increased in cultures of monocytes. The agents of foot and mouth disease and fowl plague according to Köbe and Fertig (15) and to Hallauer (11) multiply only in epithelium. Findings of this sort serve to demonstrate even more clearly than in the living animal the strict cytotropism of some viruses. They also forcefully reveal how closely adapted these viruses are to subtle differences in metabolism or other properties which must distinguish one cell type from another. In contrast to such agents the cytotropism of certain other viruses appears to be much broader. The virus of vaccinia has been grown in pure cultures of Kupffer cells by Beard and Rous (5) and in cultures of blood monocytes by Florman and Enders (16) as well as in corneal epithelium by Rivers and his co-workers (17).

With Feller and Weller (18) we have obtained evidence that this virus will also increase in fibroblasts although pure cell cultures were not used. If cell injury and death be criteria for the multiplication of a virus, the agent of equine encephalomyelitis is pancytotropic in respect to the cells of the chick embryo as revealed by unpublished experiments of Relova and myself and by the more recent observations of Huang (19). In experiments carried out during the past year with the Lansing strain of poliomyelitis virus we have, in collaboration with Robbins and Weller (13), determined that multiplication takes

place in cultures not only of nervous tissue but in those composed of fragments of intestine as well as in those consisting mainly of skin and striated muscle. Since no intact nerve cells were present in the cultures of skin and muscle it is highly probable that cells other than those of the nervous system are susceptible to this strain of the virus.

Varying degree of resistance of cells to different viruses. We have so far been mainly concerned with observations which show that certain cells may be completely resistant while others are susceptible. There are many data to suggest, however, that between these two extremes different types of cells may exhibit variable degrees of susceptibility to different viruses. Variation in susceptibility may be expressed in two ways: first, by differences in the quantity of the virus produced by different cells within a fixed period, second, by the extent of the injury the cell undergoes as a result of the presence of the virus.

That different tissues, at least, vary in their capacity to support the multiplication of a virus is indicated by numerous experiments in which the virus content of tissues removed from infected animals has been measured. As illustrations, it will be sufficient to mention two investigations in which determinations of the concentration of virus present in different parts of the infected chick embryo have been carried out. Pearson (20) employing the Melbourne strain of influenza A virus found it present in largest quantities in the allantoic fluid and yolk sac. Relatively low concentrations were observed in the amniotic fluid and in the embryo itself. Similarly in unpublished experiments we have observed that with an egg-adapted strain of mumps virus the highest yields were obtained in the embryonic fluids and membranes. In the embryo itself small amounts were encountered. Very little has been done with tissue cultures to determine whether isolated cells vary in their capacity to support the growth of virus. I can only refer to some observations made in my laboratory a few years ago when it was noted that in roller tube cultures of fibroblasts developing from fragments of chick embryonic heart muscle the production of vaccinia virus appeared to be somewhat greater than in comparable cultures of blood monocytes.

As I have said, the extent of injury the cell undergoes as a result of the presence of a virus may also be interpreted as measure of its resistance or susceptibility to the pathogenic effect of the infecting agent. Thus it has long been apparent that the nerve cells are particularly sus-

ceptible to certain neurotropic viruses, the parenchyma cells of the liver to yellow fever virus and so on. Indeed so little affected are other types of cells in such diseases that it has often been held that the responsible agents multiply only in those cells which exhibit gross manifestations of injury. Evidence obtained by a variety of techniques during the past 15 or 20 years shows, however, that obvious cell injury is not the inevitable consequence of virus multiplication. Some of the most conclusive information on this important point has been gained through measurements of virus increase in tissue cultures correlated with the histological examination of the infected tissues. Thus the virus of equine encephalomyelitis not only increases very rapidly in cultures of mixed chicken embryonic tissues but within 24 to 48 hours brings about the death of all or nearly all the cells as indicated by morphological appearance and cessation of metabolism (19). In sharp contrast the virus of mumps, as we have recently found, increases relatively slowly in cultures of chick amniotic membrane and continues to multiply for several weeks without inducing any recognizable change in cell morphology or metabolism as measured by acid production (21). Similarly Florman and I (16) could detect no pathologic changes in cultures of blood monocytes in which vaccinia virus continued to multiply for several weeks. Vaccinia virus, however, induces the formation of cytoplasmic inclusions in fibroblasts growing out of fragments of chick embryonic tissues in roller tube cultures (18). Nevertheless the death of these cells does not appear to ensue immediately. Indeed such cultures may continue to metabolize and cell growth take place for many weeks while multiplication of the virus continues at a fairly constant rate. It is also probable that certain other viruses exert an injurious effect on cells only after prolonged contact. Thus we have lately repeatedly observed in cultures of various human embryonic tissues infected with the Lansing strain of poliomyelitis virus degenerative changes in most of the cells after 25 to 32 days of cultivation although it was shown that the agent had undergone active multiplication at a much earlier period when no cytologic abnormalities attributable to the effect of the virus could be discerned (13). Dr. Herbert Morgan has observed an analogous series of events in tissue cultures infected with psittacosis virus (22).

I have dwelt at this length upon the variation in the pathogenicity of various viruses for different cell types not only because it illustrates

a difference in resistance between cells but to re-emphasize the fact that the multiplication of some mammalian viruses may occur, and often does occur, quite independently of any demonstrable injurious effect on the cells with which they are associated. This fact, as we shall see, may be important in considering the problem of acquired cellular immunity which I shall now very briefly discuss.

PROBLEM OF ACQUIRED CELLULAR IMMUNITY TO VIRUSES

Indications that cells acquire specific resistance as a result of infection. The possibility that tissue cells may acquire a specific immunity to viruses is suggested mainly by the failure in numerous instances to demonstrate a constant correlation between the presence or concentration of virus-neutralizing antibodies in the body fluids and the resistance to reinoculation of an animal that has been previously infected or vaccinated.

Many examples of this phenomenon could be cited. It will suffice here to recall only one. Hodes and Webster (23) found that mice which had been vaccinated with St. Louis encephalitis virus developed a very considerable resistance to reinfection which lasted for 6 or 7 weeks. During most of this period, however, virus neutralizing antibody could not be demonstrated in the serum. Later when such antibody had appeared, resistance to reinfection had diminished. At the end of 20 weeks when the animals again became entirely susceptible to infection, the antibody was still present in high titer in the blood.

Findings of this sort are indeed difficult to explain entirely on the grounds of humoral immunity. In some cases as Vieuchange and Galli (24) have shown in dermal infections with vaccinia virus the neutralizing antibody first emerges locally in the area of the infected tissues and only appears later in the blood stream. But the interval of time between these two events is usually short, not exceeding a few days. It is difficult therefore to explain such phenomena as described by Webster and Hodes on the basis of local antibody retention.

The theory of course has long been current that under certain circumstances the antibody produced at the site of infection remains permanently fixed to the cells and does not enter the circulation in appreciable quantities. Lépine (25), just before the war, again discussed this hypothesis and presented some evidence to support it. On the whole,

though, in spite of many attempts to demonstrate antibodies exclusively associated with the cells no convincing evidence that this occurs has been presented

In other instances interference between the inactive virus originally introduced and that employed for reinoculation might be responsible for the observed resistance. The effects of interference, however, would not be expected to be very durable—at least when inactivated virus is employed as an immunizing agent

Failure to demonstrate the development of cellular mechanisms which prevent the multiplication of virus If, then, neither virus neutralizing antibody nor the interference phenomenon adequately explain such manifestations of acquired resistance, can it be shown that the cells of immunized animals removed from the influence of neutralizing antibody or other inhibiting factors in the serum fail to support the multiplication of the homologous virus?

The bulk of experimental results would seem to leave little doubt that the answer to this question is in the negative. When adequate precautions have been taken to eliminate absorbed antibody, fixed tissue cells derived from immune animals have been shown by the tissue culture method to be as susceptible as those obtained from normal individuals. Moreover, various types of phagocytic cells removed from immune donors when freed of antibody by repeated washing have not been found to inhibit the multiplication of virus to a degree exceeding that exhibited by comparable cells from normal animals. In support of these statements it is only necessary to refer to the work of Andrewes on the propagation of herpes simplex virus (26) and Virus III (27) in fragments of rabbit testicle, the experiments of Rous, Hudack and MacMaster (28) with rabbit embryonic tissues and vaccinia virus, those of Beard and Rous (5) with isolated Kupffer cells and vaccinia and those of Smorodinseff and Shushkina (29) with polymorphonuclear leucocytes and macrophages from mice immunized against influenza A virus

Possibly unrecognized mechanisms dependent upon increased resistance of cells In conclusion we shall inquire whether there may be any other possible mechanisms of acquired immunity to viruses associated with or developed by the cells. Relatively recent observations suggest that perhaps two hitherto unrecognized responses of this sort may occur. Various workers such as Grabar

and Schoen (30) in France as cited by Lépine (25) and Gard (31) in Sweden have obtained from extracts of infected tissue removed during the acute stage of certain virus diseases, factors which when mixed with the homologous virus inhibit its activity. Whether or not these antiviral factors are to be identified with serum antibodies or whether they are distinct products of the cell or possibly the virus itself has not yet been conclusively determined. It is probable, however, that they do not represent the usual type of antibody. In a personal communication Dr. Gard has informed me that the factor he has obtained from mouse brain infected with Theiler's virus is more heat resistant than the known antibodies and also resists digestion by such active proteolytic enzymes as ficin. Grabar and Schoen prepared their material from the brains and lungs of mice infected with the virus of lymphogranuloma venereum. Mice infected with this virus do not develop in the blood appreciable quantities of neutralizing antibodies. It is unlikely therefore, that the antiviral activity of these extracts can be attributed to the usual type of neutralizing antibody. In this connection the recent experiments of Bodian (32) are also relevant. He has shown that monkeys suffering from acute poliomyelitis caused by one serologic type of virus are usually refractory to intracerebral inoculation with a heterologous strain. In contrast, convalescent monkeys are not immune to heterologous strains. Bodian does not believe that the resistance exhibited by monkeys in the acute phase of the disease depends upon the interference phenomenon.

The possibility, then, that under the impact of primary infections certain cells may respond by the production of antiviral factors which have hitherto not been recognized must obviously be further investigated.

Another approach to the problem may have been opened by observations by Galli and Cipollone (33) which were reported in 1941, but have not yet been confirmed. Following repeated unilateral intratesticular inoculation of formalin-inactivated vaccinia virus in rabbits, these workers noted that a high concentration of virus neutralizing antibodies developed in the blood serum. In such animals, in spite of the presence of the antibody, active virus introduced into the skin or into the untreated testis produced reactions which were only moderately or slightly less severe than those observed in unvaccinated rabbits. In contrast, the injection of the same quantity of

virus into the vaccinated testicle did not induce an inflammatory reaction. Yet titration of the virus content of each testicle showed that the agent had increased greatly and to the same degree in both. Failure of the vaccinated testicle to react could be demonstrated at least 37 days after inoculation of the last dose of vaccine. If these experiments can be confirmed, it would seem that

resistance to the pathogenic effect of a virus may be induced without increasing the capacity of the cell to prevent the multiplication of the agent. The thought that the response of a cell may be altered artificially in this manner, is perhaps rendered more acceptable by the fact that in normal cells the response to injury is not an inevitable consequence of virus proliferation.

INHIBITION OF SOME HEMAGGLUTINATING VIRUSES

S G ANDERSON

From the Department of Preventive Medicine, Western Reserve University

CLEVELAND, OHIO

THE polysaccharides have been studied more intensively than several other agents (1-3) which are known to inhibit viruses. This study of the polysaccharides has been integrated with research on the relation of virus to host cell. I will first briefly mention this relation as it applies to the viruses of the mumps-influenza group, and later will describe inhibitors of these viruses found in serum, ovarian cyst contents and other mucous secretions, allantoic fluid, vegetable polysaccharides and certain bacterial extracts.

You are all familiar with the phenomenon of the attachment of the hemagglutinating viruses to red cells (4), and know that with many strains there is a subsequent elution of apparently unchanged virus and a permanent alteration of the cell. Elution is believed to be due to enzymic alteration of cellular receptors.

Several types of bacteria, notably the *cholera vibrio*, produce soluble products which cause receptor alteration much more rapidly and completely than do the viruses of mumps, Newcastle disease or influenza (5).

The attachment of virus to red cell has been considered to be a model of the early stages of the infection of living cells. The comparison may be only partly valid (6).

Polysaccharide inhibitors may be conceived to act in two ways: they may prevent the attachment of virus to cells (red cells, or living or dead tissue cells) or may modify the multiplication of virus within living cells.

In normal animal serum, there are at least two types of inhibitor. One is possibly a globulin, it is destroyed by heat at 65° C. in less than 30 minutes (7). It is slowly destroyed by cholera filtrates, but apparently is not altered by incubation with live virus. It inhibits hemagglutination by living virus, but only to low titer, this titer varies between strains, being in general higher with the more recently isolated strains. The titer also varies considerably according to the particular chicken which supplies the red cells for the Hirst inhibition test (8).

A second class of inhibitor we believe to be a

mucoid (9) and I will assume this to be so during the rest of this paper. It inhibits hemagglutination by virus which has been heated to 56° C. for 30 minutes and it is the substance responsible for the phenomenon described by Francis (10) in 1947. It is thermostable, in fact the apparent titer of the substance increases up to 8-fold when a 1:10 dilution of serum in saline is heated to 100° C. for one minute. It is rapidly destroyed by cholera filtrates, and also by live virus at 37° C. (11). In the latter case the system reaches an equilibrium, at which the amount of inhibitor inactivated is characteristic of the virus used (12). The inhibitor is destroyed by large amounts of periodate (12), a reagent which is particularly active against carbohydrates.

A similar mucoid inhibitor has been isolated from human ovarian cysts (12), and the action of periodate on this mucoid has been particularly studied (13). The raw mucoid will inhibit hemagglutination by heated WSE influenza virus, but not by living WSE, and will reduce the infective titer of WSE 10-100 fold. A large amount of periodate will destroy this inhibitory power completely, but mucoid treated with small amounts of periodate will inhibit hemagglutination by living WSE virus, and will reduce the infectivity of WSE about 1000-fold as tested in the chick embryo. You will see that mild periodate treatment of mucoid has magnified its inhibitory power against live virus, such treated mucoid can no longer be destroyed by virus, or by choleia enzyme.

Essentially the same properties are shared by inhibitors from a wide variety of sources, such as egg white (14), allantoic fluid (15, 16) and aqueous extracts of many tissues (17), particularly of certain salivary glands of ferrets, men, mice and sheep. It is possible that blood group A substance should be included in this list (12). A similar inhibitor can be extracted from red cells of certain species (17, 18), partly because of this, there has been commonly accepted the working hypothesis that red cell receptors and soluble inhibitors are closely related.

Probably all these inhibitors act by competing with the red cell for the virus surface. It seems likely that this competition gives rise to a state of dynamic equilibrium between the various possible combinations of virus, cell and inhibitor. For example the estimated titer of either inhibitor in serum is greatly influenced by the type of chicken cells used in the system (11). When cells with a low affinity for heated virus are employed, the titer of mucoid inhibitor in a serum may be, say 5000, if cells with a high affinity are added to the system, the inhibitory titer will be in the region of 100 with the same serum. This suggests that the union of virus with inhibitor is reversible, and that, in the circumstances I have described, the dissociation of virus and inhibitor is not due primarily to enzymic action of the virus. This is supported by the finding of Hardy and Horsfall (19) that virus in the presence of a certain inhibitor in allantoic fluid is equally as infectious as virus in the absence of inhibitor, though the virus cannot free itself from this inhibitor by enzymic action.

We have seen that in this competition for the virus, the advantage is given to the mucoid rather than to the red cells, either when the mucoid is partially treated with periodate or when the virus is heated. Either procedure prevents subsequent action of the virus enzyme. It has been concluded that these mucoids act as inhibitors because their attraction for the heated virus is not reduced by enzymic activity, and conversely that live virus is not inhibited because it can inactivate the inhibitor (19-21). There appear to be two difficulties to this explanation. a) Although at 0° C enzymic action of virus on mucoid inhibitor is minimal, live Lee virus in our hands is not inhibited to significant titer even at this temperature. b) When live virus agglutinates red cells at 0° C in the presence of inhibitor, the thermostable agent which can be recovered from the system is still highly potent in the inhibition of heated virus. Of course, there can be no doubt that live virus will react with inhibitor and destroy it at 37° C and that heated virus cannot react in this way. But is it safe to assume that this functional difference is the basis of the inhibition of heated virus by mucoid? It may be, for example, that the greater effect of the mucoid inhibitor on heated virus is due to a thermal alteration of the adsorptive surface of the virus rather than to the loss of enzymic activity per se (22).

Svedmyr reports (16) that the inhibitory agent

for PR8 hemagglutinin, present in normal allantoic fluid, is in the main connected with particles with a sedimentation constant of 200 S. This component reacts in precipitation tests with virus, and does so in definite proportions. The inhibitor progressively decreases in amount in infected embryos, and is destroyed *in vitro* by live virus and by cholera filtrate. It does not inhibit virus multiplication in the egg. Svedmyr briefly describes a second type of hemagglutinin inhibitor in allantoic fluid, an inhibitor which is not susceptible to inactivation by virus and which is not sedimentable at 27,000 r.p.m. These two inhibitors may well correspond to the two described before as being present in normal serum. Hardy and Horsfall (19) have suggested that in infected allantoic fluid some of the virus is linked to an inhibitor which it does not inactivate. It may be that this substance is the same as Svedmyr's unsedimentable inhibitor and the same as the thermostable inhibitor in normal serum described by McCrea in 1946 (7).

Svedmyr believes the thermostable particulate inhibitor may be derived directly from the cell receptors lining the allantoic cavity. This concept of the identity of the 'soluble' thermostable inhibitor, the receptors on red cells, and the receptors on susceptible tissue cells, constantly appears. On the basis of the latter part of this hypothesis, Dr Stone (23) in 1947 carried out a series of interesting experiments. She reasoned that if the hypothesis were correct, the cholera filtrate which readily destroyed red cell receptors should also destroy tissue cell receptors. With their receptors destroyed, the cells would not be susceptible to virus attack. Her experiments confirmed this. Prior treatment with cholera filtrate in the allantoic cavity of chick embryos prevented subsequent infection in all the eggs inoculated with up to 30 infective doses of CAM influenza virus, and in about 90 per cent of eggs inoculated with 50 ID₅₀ of NDV. The protective effect lasted for about two days following the cholera treatment. After about 54 hours the receptors were apparently regenerating and the cells again became susceptible.

You will remember that the salivary mucus of ferret, mouse and man had a particularly high titer of thermostable inhibitor, in these species clinical signs of influenza are readily produced. There is a suggestion, though no more, that the sheep, which is the only other animal known to have a high titer of inhibitor, may also be clini-

cally infected. These correlations seem more than coincidental, but their significance remains open to question. It may be that the presence of inhibitor in the respiratory secretions merely reflects the presence of virus receptors on respiratory cells, or the relation may be more direct in that virus more readily persists, and infects in the presence of a mucin to which it can be adsorbed and with which it can react enzymically. It is cogent to ask whether in other species the respiratory mucin, which is not so susceptible to virus action, prevents the rapid spread of virus over the respiratory cells.

Bacterial polysaccharides were reported by Levine and Frisch in 1932 (24) to inhibit the lysis of the corresponding bacteria by bacteriophage. Burnet and Gough (25, 26) confirmed the specificity of this inhibition and believed that it was due to the blocking of the bacteriophage by the polysaccharide. More recently, Maurer and Woolley (27) described the non-specific action of pectin in preventing lysis of bacteria after they have been infected with bacteriophage. Apple pectin has also been found by Green and Woolley (28, 29) to prevent hemagglutination due to Lee virus, and in doing so to adhere both to virus and to red cells. It was also partially or completely effective in inhibiting Lee virus multiplication in the fertile hen egg, even when given 1-2 hours after inoculation of the virus. The authors were stimulated to investigate apple pectin because it was thought to be possibly an analogue of the hypothetical cellular substrate of the influenza virus. Subsequently Woolley (30) has reviewed the subject of competition between analogues and has suggested (31) that such competition may be the basis of the inhibitory action of apple pectin.

It is not known whether the effect of these pectins is destroyed by virus or by cholera filtrates. Woolley (29) states that of the polysaccharides tested the most active were polygalacturonides but that those containing glucuronic acid and mannuronic acid had some potency.

So far I have referred to competitive adsorption and the prevention of receptor-virus union as the mechanism of inhibition. The point of view of Horsfall and Ginsberg (32) strikes a new note.

They believe that bacterial polysaccharides inhibit virus multiplication by an intracellular action. They believe that the virus can enter the cell but cannot multiply there because of the presence of the intracellular polysaccharide. The background of their thesis is briefly this:

Horsfall and McCarty (33) reported that substances, probably polysaccharides, found in several species of bacteria would inhibit multiplication of pneumonia virus of mice in the mouse lung. This effect was seen even if the polysaccharide was given up to 4 days after the initial infection. Ginsberg and Horsfall (32) later found that 1 mg of Friedlander bacillus polysaccharide would prevent the reproduction of mumps virus in the allantoic cavity of chick embryos so long as the inoculum was less than 10^5 ID₅₀. These authors placed polysaccharide, together with a large amount of virus in the allantoic cavity, and found some virus was absorbed. They assumed that if a smaller inoculum were used (such as 10^5 ID₅₀), a portion of that, too, would be absorbed. They believed therefore that polysaccharide inhibits mumps inside, not outside the cell.

To summarize, I have described two types of inhibitors of hemagglutination in serum. One is destroyed at 65° C and is possibly protein, the other is thermostable and is probably mucoid. Both act by combining reversibly with extracellular virus. Two inhibitors described in allantoic fluid, and the inhibitor found in mucous secretions, may be of the same type as those in serum. Certain bacterial polysaccharides have been postulated to inhibit intracellular virus multiplication.

Work in this field is a step toward unravelling the relation between virus and host cell. If it is true that the mucoid or vegetable polysaccharide inhibitors are analogues of the cell receptor, we have one phase of that relation reproduced in a simple system and in solution. On the other hand, as Horsfall, McCarty and Ginsberg have said, their work may open the way to a study of *intracellular* metabolic processes. Because of this I believe it is very important to have confirmation of their hypothesis that bacterial polysaccharide affects intracellular virus metabolism rather than adsorption of virus on cell.

authors as precursor or immature form of the virus

A similar suggestion could serve as an explanation of the following data. If one injects a large dose of optimally prepared virus into the allantoic sac and studies thereafter, at hourly intervals, the allantoic fluids and membranes from representative numbers of eggs, for their infectivity, hemagglutinating and complement-fixing activities, it can be seen, allowing one hour for adsorption of the seed, that the infectivity in the fluid and tissue remains constant for 6 and 5 hours, respectively. On the other hand, development of hemagglutinins becomes measurable after the third hour, and they increase 30- to 100-fold before any rise in infectivity is noted. The complement-fixing antigen develops in the membranes even before the hemagglutinins, a fact recently reported also by Hoyle. This series of events is the more striking if one considers that the order of increasing sensitivity of these three tests is just the reverse, the complement fixation test being the least sensitive.

Further experiments revealed that the rise in hemagglutinins, prior to that of infectivity, is accompanied by the development of interfering activity as measured after inactivation of the various preparations by ultraviolet light. Although the origin of this non-infectious, but hemagglutinating, interfering and complement-fixing material is not definitely established, whether it is a breakdown product of the seed virus or an intermediary stage of virus formation, all indications point to the latter possibility at present.

As far as the interactions between host and interfering agent are concerned, the interference phenomenon can be induced only by direct contact of the host cells with the irradiated virus. The effect can not be counteracted either by flushing of the allantoic cavity with saline solution, or by the injection of potent immune serum immediately after the administration of the interfering agent. It is apparent, therefore, that interference is induced very rapidly, and possibly within less than one minute. The cells thus altered remain so for at least 6 days. It does not seem to matter whether a few or 10 million ID_{50} of active virus are used for the challenge, the results of interference appear identical. However, recent observations seem to indicate that the interfering activity may be overcome to some extent by the use of excessive amounts of active virus, a point which is at present under investigation.

The quantitative aspects of the interference phenomenon in this system have not been clearly worked out as yet. Rough estimates of the number of cells lining the allantoic cavity of the 11- to 12-day-old chick embryo by two different approaches led to the figure of about 10^8 cells. The equivalent of approximately 10^8 ID_{50} of virus in the inactivated state is required to produce interference to such an extent that no measurable amounts of hemagglutinin are formed. Thus it appears that the equivalent of about one ID_{50} per cell will cause interference. However, it is not known whether every cell lining the allantoic sac will support viral propagation, and the number of virus particles constituting one ID_{50} , likewise, has not been definitely determined although it appears to be of the order of 10 and possibly less. These considerations would imply that the quantitative aspects are very similar to those encountered in the bacteriophage system by Luria and Delbrück.

The interference reaction is non-specific in the sense that inactivated influenza virus interferes with the active agents, not only of the homologous but also of the heterologous types, as well as with some strains of mumps virus, equine encephalomyelitis, epidemic keratoconjunctivitis, Newcastle disease, and possibly other viruses. There is no obvious difference in the degree of cross-interference between influenza A and B viruses, if the irradiated virus is injected prior to the administration of the active agents. However, if the irradiated virus is injected after infection, during the first hour of the first infectious cycle, then the homologous irradiated virus may markedly affect viral propagation in the tissues, whereas heterologous irradiated virus inhibits only to a lesser extent. This would seem to indicate that interference may be obtained at two different levels of the infectious cycle, at the first, a relatively non-specific effect is obtained, whereas at the second it appears rather specific for the type.

Various hypotheses have been proposed to furnish an explanation for the interference reaction. Many of these can be disregarded since they obviously do not apply to the system under study. However, two of these, suggested by Ziegler and Horsfall, and by Delbrück and Luria, respectively, require discussion. They are 1) blockade or destruction by the primarily injected virus of cell receptors which mediate also infection of the host tissue by the second virus, and 2) blockade of a key enzyme in the host cell by the interfering

agent which is necessary also for the propagation of the excluded virus

The cell receptor theory, of course, is based on the studies of the hemagglutination phenomenon. As is well known, influenza virus is adsorbed onto and subsequently eluted from chicken red cells, and the erythrocytes thus treated become non-agglutinable, as measured by the addition of fresh homologous virus and, to a varying extent, by other strains of virus of the homologous and heterologous types. Similar phenomena of adsorption and elution have been observed by Hirst and by Stone, to occur in the lungs of ferrets and mice, and in the allantoic cavity of the chick embryo, under conditions which in all probability, would have precluded viral multiplication. Elution of active or inactivated virus has not been demonstrated as yet in the intact host. Furthermore, as has been pointed out previously, ultraviolet irradiation of influenza viruses destroyed the interfering property more rapidly than the hemagglutinating property. In other words, on prolonged irradiation a preparation may be obtained which does not cause interference but still is adsorbed and eluted from red cells to an apparently unaltered degree.

Finally, cells which have been treated with interfering preparations of irradiated virus still may adsorb additional virus of the homologous or heterologous types.

Although receptor blockade thus can be ruled out as the major cause of interference, it has not been entirely excluded as a contributing factor. Adsorption of virus onto the allantoic tissue amounts to only about 70 per cent in the average, the remainder of the seed virus being left free in the allantoic fluid. If this equilibrium is markedly

disturbed by secondary injection of large amounts of virus, the additional adsorption apparently is more pronounced than in the case of small amounts of challenge virus, where less additional adsorption seems to take place. These relationships will bear further clarification since the experimental conditions are such as to approach closely the limits of accuracy of the available techniques used for the assays.

As to the key enzyme hypothesis of Delbruck and Luria it seems to fit best to most of the available data. It is possible that the enzyme or enzymes affected are necessary both for viral and host cell multiplication. It was found that bacteria, treated with irradiated phage, discontinued multiplication, and, similarly, the allantoic sac of the 8-day-old chick embryo, injected with irradiated influenza virus, failed to grow thereafter at the normal rate. If the key enzyme hypothesis is correct, one would have to postulate now that one enzyme system must be involved in propagation of a number of viruses, and, consequently, its blockade would be responsible for the interference phenomenon between immunologically distinct viruses. The specific interference obtained by injection of irradiated virus of the homologous type within the first hour after infection, i.e., during the first infectious cycle, would seem to have to be caused by blockade of another enzyme system involved in production of components needed only for formation of virus of the homologous type.

It is obvious from these remarks that we are still far from having a satisfactory explanation for the interference phenomenon and, indeed, it may very well be that not a single explanation will ultimately fit all the observed facts.

TRAVEL AWARDS

18th International Physiological Congress

The Executive Committee of the Federation of American Societies for Experimental Biology has authorized the granting of five or more Travel Awards to younger scientists in the physiological field desiring to present papers before the 18th International Physiological Congress in Copenhagen, Denmark, August 15 to 18, 1950. Awards will be in the amount of \$500 each, and will be made to those scientists, not older than 35 years, who submit for presentation the best contributions in physiology, broadly defined, and give the best evidence of creative productivity. Membership in one of the Federated Societies will not influence selection for an award.

Applicants may address letters to Dr. M. O. Lee, Federation Secretary, 2101 Constitution Avenue, Washington 25, D. C., enclosing seven copies of an abstract of the paper proposed for presentation, and seven copies of a curriculum vitae and bibliography. The applicant should also include a list of two to four references, scientists competent to evaluate the applicant's work.

Applications will be received until January 20, 1950.

A Federation Committee, consisting of the Presidents of the six Societies, will select the individuals to receive the travel awards.

Books You Should Not Overlook

HOBBER

Physical Chemistry of Cells and Tissues

Presents material of major importance to teachers, students and workers in physical chemistry, medical and biological physiology. Emphasis is given to new developments in submicroscopic structures. Some of the contents: principles of physical chemistry; properties, architectural and functional significance in living matter of the large molecules; respiration of

cells and tissues; passive penetration etc. "For the advanced students and investigators interested in the application of physical chemistry to biological systems, this volume is indispensable," says the *Medical Times*. "The Authors have done an excellent job" *Clinical Medicine*.

70 Illus., 676 Pages, \$6.00 (*Reprinted 1948*)

WINTON & BAYLISS

Human Physiology (3rd Edition)

Students in medicine and dentistry will find in this very popular textbook a thorough presentation of the relationships between pathology and physiology, and of physiological experimental evidence. All chapters have been revised and a large number of new illustrations added. Each section was written by a colleague

with special knowledge and experience—a particularly valuable feature. Subject matter includes the circulation, autonomic nervous system and chemical transmission at nerve endings, the sense organs, ductless glands, and many others.

248 Illus., 592 Pages, \$7.00 (*1948*)

Blakiston's New Gould is the only completely new medical dictionary in 38 years. Do you have one? Textbook edition \$8.50—Thin paper edition, \$10.75—Deluxe edition, \$13.50

The Diagnosis of Pancreatic Disease

by **Louis Bauman, M D**, *Formerly Assistant Professor of Clinical Medicine, Columbia Univ., and Assistant Visiting Physician to the Presbyterian Hospital, New York*

A monograph on the pancreatic function tests and their application to the diagnosis of pancreatic disease

"Dr Bauman's experience during the past twenty-five years in the study of metabolic disease and pancreatic lesions, in association with the medical and surgical services at the Columbia-Presbyterian Clinic, eminently qualify him in his analysis of the large mass of clinical and laboratory data in these fields. His management is based upon carefully checked and followed clinical histories

"This is a much-needed monograph and should stimulate further studies in the clinics of this country in pancreatic disease"—from the Foreword by Allen O Whipple, M D

SIX-PLACE ELECTRIC STYLUS INPUT CONTROL

FOR DRY RECORDING ON ELECTRO-SENSITIVE PAPER

8075-C

ELECTRIC STYLUS INPUT CONTROL, Six-Place, for dry recording on electro-sensitive paper, without use of smoked paper or ink, in accordance with circuit design developed at the Merck Institute for Therapeutic Research. Provides a harmless, precisely controlled power source for producing continuous line recordings on Teledeltos paper, and can be used on practically any kymograph with minor modification.

Consisting essentially of an electronic power unit with six separate electric circuits and controls for regulating the electric current of individual stylus, six removable stylus circuit leads, 6 ft. long, with connecting tips and clamps, pilot lamp and on-off switch, mounted in a ventilated metal case with sloping panel and gray crystal lacquer finish.

Teledeltos paper is an electrically conducting, coated sheet developed by Western Union. Requires no preparation, developing or processing in the laboratory, and is permanently blackened where an electric current passes through the coating. Resulting records are sharp and clean and unaffected by light or atmosphere.

8075-C. Electric Stylus Input Control Six-Place as above described with 5 ft. connecting cord and plug but without Teledeltos paper. For 115 volts 60 cycles, a.c. only. 96 00

8018-T Paper Teledeltos Electro-Sensitive for use with above in rolls containing 300 ft. 15 50
Per roll, 6-inch 9 50 Per roll, 10-inch

2101 Constitution Ave , Washington, D C

FEDERATION PROCEEDINGS is published quarterly by the Federation of American Societies for Experimental Biology. The *March* issue consists of the program (Part II) of the Annual Meeting of the Federation, and the Abstracts (Part I) of the papers presented at the scientific sessions. The program includes an author index. The abstracts are arranged alphabetically according to the first author and segregated as to Societies. The *June* and *September* issues contain symposia and other special papers presented at Federation meetings as selected by the Editorial Board. The *December* issue contains the membership list and other matters pertinent to the Constituent Societies of the Federation.

Price Schedule

The subscription price is \$4.50 (\$5.25 foreign) payable in advance. Single issues may be purchased, if ordered in advance, at the following prices: No. 1 (Part I, March, Abstracts), \$3.00, No. 1 (Part II, March, Program), 50¢, Nos. 2 and 3 (June and September), \$1.50 an issue, No. 4 (December), \$2.00 an issue. Subscriptions and orders should be sent to the Federation of American Societies for Experimental Biology, 2101 Constitution Ave., Washington 25, D. C.

Entered as second-class matter March 16, 1942 at the Post Office at Baltimore Maryland under the Act of August 24, 1912

Simplified Radiation Detectors with Maximum Efficiency

Model D46—Q Gas Counter for
maximum efficiency in counting soft radiation

NUCLEAR radiation counters are specially constructed to record the highest possible ratio of *accurate* counts in relation to the total disintegration of the sample. By continued research and experimentation, NUCLEAR has been able to build into its detectors features that prevent great losses due to poor geometries, absorption, coincidence, recombination, etc. Thus NUCLEAR engineers have increased yields without sacrificing the high counting accuracy demanded in nuclear research. NUCLEAR detectors are faster and easier to use because results are always reproducible—a standardization count being necessary only when the instrument is first acquired. This more scientific approach to radiation counting is your assurance of greater overall efficiency, accuracy and dependability. Before you buy, get all the facts about these and other NUCLEAR products and services.

SEND FOR THIS NEW, COMPLETE CATALOG!

- Complete information on all instruments including applications, specifications, features, dimensions, etc. Also details on NUCLEAR's special services and products. No organization engaged in nucleonics should be without this complete catalog!

FEDERATION NOTICE

To facilitate the publication of an accurate and up-to-date Membership list in the December issue of *FEDERATION PROCEEDINGS*, it is requested that *any member whose entry in the December 1949 issue is incorrect* furnish the Secretary of his Society with the following data, in duplicate, on 3" x 5" cards: Name, Degree (highest), Mailing Address (street address, city, zone, state), Present Position (title and department or branch), Society membership and year of election to membership in that society. If you are retired, give only degree(s), home address, and society membership(s) with year(s). If you are officially carried on the rolls of your society as a retired or honorary member, please so indicate.

Names and addresses of the Society Secretaries are as follows:

The American Physiological Society—Dr. M. O. Lee, 2101 Constitution Ave., Washington, D. C.

American Society of Biological Chemists—Dr. Richard W. Jackson, Northern Regional Research Laboratory, Peoria 5, Ill.

American Society for Pharmacology and Experimental Therapeutics—Dr. Harvey B. Haag, Medical College of Virginia, Dept. of Pharmacology, Richmond 19, Va.

The American Society for Experimental Pathology—Dr. Sidney C. Madden, Brookhaven National Laboratory, Upton, N. Y.

American Institute of Nutrition—Dr. J. H. Roe, George Washington University, School of Medicine, Washington 5, D. C.

The American Association of Immunologists—Dr. Jules Freund, Public Health Research Institute of the City of New York, Inc., Foot of East 15th St., New York City.

At any future time when you wish a correction made, please notify your Society Secretary by supplying all required information as above. Your Secretary, in turn, will forward the information to the Federation Secretary.

This booklet will be sent on request

**4 SIGNIFICANT
REASONS WHY
MANY PHYSICIANS
AND HOSPITALS
PREFER.**

(1) **PURITY**—Crystalline Penicillin G Sodium Merck is unsurpassed in purity. Removal of impurities and therapeutically inert materials, and the absence of substances which may act as foreign bodies make this form of penicillin suitable for *all* routes of administration which may be indicated, including intrathecal injection.

(2) **RAPID ABSORPTION AND THERAPEUTIC EFFECT**—Prompt absorption of the penicillin in aqueous solution permits rapid therapeutic action. This often is an important consideration, particularly in serious and fulminating infections.

(3) **SIMPLICITY OF ADMINISTRATION**—Aqueous solutions of Crystalline Penicillin G Sodium Merck are easy to handle and inject. Pain and irritation on injection are reduced to a minimum.

(4) **EASY ADAPTABILITY TO THERAPY**—Crystalline Penicillin G Sodium Merck never is contraindicated in cases in which penicillin itself is tolerated and indicated.

● We submit these four reasons for specifying Crystalline Penicillin G Sodium Merck when penicillin is indicated.

**CRYSTALLINE
PENICILLIN G SODIUM

FRACTIONATION PROBLEMS?

here's help for you . . .

THIS tireless servant in your laboratory will automatically collect any number (up to 200) of rigidly controlled samples of predetermined fluid volumes. Each collected sample may comprise any number of drops from one to four hundred. As each separate sampling is completed, the carriage automatically advances to repeat identical collections consecutively until the whole fractionation has been made.

All you have to do is to set it up for the conditions of the chosen experiment, short or long, and then leave it alone. The machine will plod along without attention hour after hour, all day (and night) long. When the job's done, it will shut itself off.

The Technicon Fraction Collector has been thoroughly tested in actual laboratory installations, where it has proven invaluable to busy research staffs. We shall be happy to send you details.

Ref. Chromatography of Amino Acids on Starch Columns—
W. H. Stein and S. Moore, *Jrnl Biol Chem* 176, 337, (1948)

saves time and labor

relieves laboratory staff of the fretful and time-consuming chore of fraction-cutting releases workers for other duties

triples work output

you can run it twenty-four hours a day, continuously, to triple fractionation output as compared with an 8 hour laboratory day

gives greater resolution

by collecting a large number of small fractions, rather than a few gross ones, you'll get more data from a given fractionation, e.g. a chromatogram, or a fractional distillation

assures accuracy

because the possibility of human error is automatically ruled out. Now fraction-collection becomes a straightforward mechanical procedure.

the centrifuge with 9 interchangeable heads Adams Safeguard Centrifuge

The Adams Safeguard Centrifuge provides a wider range of application because **the same housing accommodates nine different types of angle and standard heads.** It can also be used for micro and semi-micro work by substituting the proper shields and tubes

The base and guard bowl are made of an integral aluminum casting, attractively finished in gray hammertone. Heads are made of a special aluminum alloy and are precision-machined to insure accurate balance. The rheostat has an "off" position and allows for continuous speed control. Rubber suction feet absorb vibration and keep the centrifuge from creeping, even on a glass surface.

CT-1230/D Adams Safeguard Angle-head Centrifuge, 12 Place (Illustrated above) For 110 volts, AC-DC Complete with head and shields, but without glassware each \$105.00
220 volt models, \$3.00 additional

For full information on all Safeguard models, write for Circular 309FP

APPARATUS FOR THE PHYSIOLOGIST

— The Bird V-H Kymograph —

—Using our continuous feed principle, we offer a kymograph having the following features

1 May be used for vertical or horizontal recording

2 While designed for 10 inch paper, it will feed narrower widths The standard length roll is 80 feet

3 Eight speeds are provided Steps are in geometric progression, giving paper speeds from 2 to 450 cm min The approximate speeds are (in cm per minute) (1st) 2.2, (2nd) 11.0, (3rd) 55.0, (4th) 275.0

With these gears reversed, speeds are (1st) 4.3, (2nd) 21.5, (3rd) 107.5, (4th) 537.5

Speeds given are approximate only, since an induction motor is used for driving the rolls, and they may differ a few per cent from these figures

4 The precision, of paper movement, is not affected by use or non-use of the take-up roll, because the feed roll and the take-up roll are driven by separate motors This take-up roll, which is integral with the kymograph, may be used or not as desired

The instrument is furnished with an attractive aluminum and cast-iron stand which has a handle at the top for easy carrying For vertical recording, the kymograph is placed on this stand and securely held by a single thumb screw For horizontal recording, it may be removed in a few seconds and placed on a table An instrument bar (swinging out of the way for vertical recording) is then raised up and snapped into working position

Designed for operation on 110-120 volt, 60 cycle, A C
The instrument comes equipped with six-foot rubber covered cord and plug Independent switches for the two motors are provided 425.00

Write for our latest catalog, "Tools for Biophysics", which lists complete equipment for instruction, control or research in Physiology and Pharmacology

mass demonstration in the auditorium

The projectionist can follow a specimen through a progressive series of ever closer localizations, from its gross aspect to its ultimate microscopic demonstration under oil immersion

The auxiliary Scopicon dark chamber "round table" affords superb facility for small-group study. Here the projected image is cast upon a platen within a light tight chamber, with separate light-excluding viewing hoods for each observer. Any number up to ten may share in conference, which can be conducted in a normally lighted room. A pointer at each port permits any observer to indicate areas of interest to all the others for discussion.

for example in

exfoliative cytology

The 64,000 lumen intensity of the Scopicon high pressure mercury lamp permits auditorium demonstration of vaginal, uterine, bronchial and gastric smears and smears made from urine or other body exudates, even under oil-immersed microscope objectives. In projected images six feet or more across, every detail of the normal and abnormal cells can be seen due to the pinpoint character of the 1 mm square (approx) focal spot employed. The Scopicon light is steady, flickerless, its brilliant white color exhibiting biological stains to the greatest advantage. May we send you the brochure describing this versatile instrument?

Pure..
Wholesome..
Refreshing

Safeguarded constantly by scientific tests, Coca-Cola is famous for its purity and wholesomeness. It's famous, too, for the thrill of its taste and for the happy after-sense of complete refreshment it always brings. Get a Coca-Cola, and get the feel of refreshment.

GRASS INSTRUMENT CO.

101 OLD COLONY AVE

QUINCY, MASS

PR3 0002

MODEL P4 PRE-AMPLIFIER

A GENERAL PURPOSE PHYSIOLOGICAL AMPLIFIER

Developed for use with conventional cathode ray oscilloscopes having some amplification

This instrument provides accurate, wide range, low noise, yet inexpensive amplification for the study of electro physiological phenomena. The entire range of physiological amplitudes and frequencies are covered by this amplifier with the exception of D C potentials.

An input probe is available as an accessory to this instrument for use with micro electrodes.

Grass Instrument Company also manufactures

Electroencephalographs — used clinically and in experimental neurophysiology and pharmacology,

Stimulators — general purpose instruments for electrophysiological research,

Electrodes — scalp type for recording the EEG, Cortical electrode holders for recording the EEG from exposed brain in animals and humans, depth electrodes for stimulating recording and injecting fluids into the depths of the brain, and varied stimulating electrodes.

Write us for full specifications on any of the above.

Prompt delivery on most items.

THE ORIGINAL PRODUCT

⁶Duracillin

(Crystalline Procaine Penicillin—G, Lilly)

introduced procaine penicillin to medicine. This and all subsequent Lilly modifications of penicillin are made to fulfill the first requirement of a useful drug—recovery for the patient.

Prompt, ample, and sustained penicillin effect in body tissues is assured by careful regulation of crystal size and vehicle.

There is an effective form of 'Duracillin' to meet every preference.

Lilly Eli Lilly and Company • Indianapolis 6, Indiana, U S A

Detailed information and literature on 'Duracillin' are available from your Lilly medical service representative or will be forwarded upon request.

VOLUME 8

December 1949

NUMBER 4

THIRTY-FOURTH ANNUAL MEETING

ATLANTIC CITY, NEW JERSEY

April 17-21, 1950

THE 1950 Convention of the Federation will be held in Atlantic City, New Jersey, April 17-21. The scientific sessions of the six constituent Societies will begin at 9 00 A M, Tuesday, April 18, in the Municipal Auditorium, and will continue through Friday afternoon, April 21. Sunday and Monday, April 16 and 17, will be devoted to meetings of Society Councils, the Federation Executive Committee and other Committees. The Federation Joint Session will be Tuesday evening, April 18, in the Ballroom of the Auditorium.

Registration will open at 9 00 A M, Monday, April 17, at the Municipal Auditorium. The registration desks will be open until 10 00 P M Monday evening and from 8 00 A M to 5 00 P M on Tuesday, Wednesday, Thursday and Friday. Since the scientific sessions begin at 9 00 A M on Tuesday, members are urged to complete registration on Monday, if possible. Members of any of the constituent Societies, guests, and other biologists and physicians who wish to attend the meetings may register. The official badge, issued at registration, must be worn to secure admission to the scientific sessions and other activities of the Convention. There will be a separate registration desk where ladies who are present as guests may register without charge. Programs, abstracts and tickets for various special functions will be on sale near the registration desk.

Headquarters Hotel will be the Hotel Traymore. Information on hotels and rates, and forms for making reservations will be distributed to members by the Society Secretaries. Hotel housing facilities are adequate in Atlantic City.

EXHIBITS

Commercial exhibits will be shown from Tuesday to Friday noon in the Municipal Auditorium. Exhibitors will be publishers and manufacturers and distributors of scientific equipment, apparatus, supplies, chemicals and pharmaceuticals.

In addition, there will be provision for small scientific exhibits by Federation members and by University laboratories, Foundations and Institutes. These will consist of exhibits (not demonstrations) of new apparatus, graphs, charts and pictures. These exhibits must be set up before Tuesday morning and must remain in place until

Friday noon. Gas, water and electric facilities will not be available. There will be no charge for this exhibit space.

MOTION PICTURES

Motion pictures will be shown at one session, to be scheduled in the program. The title and abstract of the film must be submitted to the Society Secretaries. Only 16 mm safety film can be shown, equipment for sound projection will be available.

DINNERS AND LUNCHEONS

There will be ample facilities for holding group breakfasts, luncheons and dinners. It is advantageous to schedule all of these through the Federation Secretary's office. Members and groups desiring to schedule these functions should make their plans early and inform the Federation Secretary of their requirements before March 1, 1950. Specifications should include attendance expected, desirable time and alternatives, conflicts to be avoided, and whether or not a discussion session is to follow the meal.

PLACEMENT SERVICE

An office of the Placement Service of the Federation will be located in the Auditorium during the meetings, for arranging interviews between applicants and employers. Applicants for positions should write to the Federation Placement Service, 2101 Constitution Avenue, Washington 25, D C, for application forms to be returned not later than April 1, 1950. Applicants who have previously filed forms with the Service are requested to notify the office and to send additional data not later than April 1, 1950. The application forms, comprising a résumé of education, training, experience, publications and type of position desired, will be on file at the Placement Service office.

Agencies seeking personnel should write to the Federation Placement Service for employers' registration cards on which to describe the positions and to record the Atlantic City addresses. The cards should be returned to the Federation office not later than April 1, 1950. Employers who have previously filed cards should notify the office of their Atlantic City address not later than April 1

FEDERATION BY-LAWS**BY-LAWS**

Adopted at the Washington Meeting, 1936, and amended at the Boston Meeting, 1942

1 The Presidents and Secretaries of the Constituent Societies, the Chairman of the Executive Committee of the preceding year and the Federation Secretary shall form the Executive Committee of the Federation

2 The Chairmanship of the Executive Committee shall be held in turn by the Presidents of the Constituent Societies, who shall succeed one another annually in the order of seniority of the Societies

3 The Executive Committee shall appoint annually from the membership of the Federation a Secretary-Treasurer, to be known as the Federation Secretary

4 The Federation Secretary shall (a) Keep the minutes of the Executive Committee and distribute copies to the Secretaries of the Constituent Societies (b) Make arrangements for the Annual Meeting with the Local Committee, with the approval of the Executive Committee (c) Print in convenient combined form and distribute to the membership of the Federation the programs of the Constituent Societies as received from their respective Secretaries (d) Undertake such other duties to be decided upon from time to time by the Executive Committee, as do not conflict with the complete autonomy of the Constituent Societies

5 The Executive Committee shall control all monies in the hands of the Federation Secretary, who shall make an annual report to the Executive Committee for audit and approval The expenses

of the Federation Secretary, as authorized by the Executive Committee, shall be the first charge on such monies and if insufficient for the purpose the Executive Committee shall prorate such expenses to the Constituent Societies of the Federation in proportion to their respective memberships

The Executive Committee may appropriate Federation monies annually for the uses of Local Committees and for the uses of other authorized Committees but in the latter cases an audit of expenditures shall be made and approved before such committees are discharged

6 The Executive Committee shall determine the place of the Annual Meeting, and the time shall be determined by the Local Committee, preferably within the period of March fifteenth to May first

7 The Local Committee at the place of meeting of the Federation shall charge such fee for registration as may be approved by the Executive Committee The monies thus collected shall be used to defray the expenses of the Local Committee and the remainder, after such expenses have been met, shall be turned over to the Federation Secretary

8 The Executive Committee shall consider measures of advantage to the Federation as a whole Any Constituent Society may refer similar measures to the Executive Committee No action, however, shall be taken by the Executive Committee unless specifically authorized by all the Constituent Societies

9 The Chairman of the Executive Committee may appoint committees when the purposes of such committees have been approved by all the

Constituent Societies of the Federation Such committees shall be appointed for a term of one year, but may be continued and their members reappointed Such committees shall report in writing to the Executive Committee, which shall in turn report thereon to the Constituent Societies either for information or recommendation The Secretaries of the Constituent Societies shall report the recommendations of their respective Societies to the Executive Committee for final action

10 All individuals whose names appear on the program by invitation or introduction and those registering from any recognized biological laboratory may be enrolled as Associate Members of the Federation for that Annual Meeting Such Associate Members may enjoy all the privileges of the Annual Meeting except that of voting

11 No person may present orally more than one paper during all of the scientific sessions of the Constituent Societies at the time of the Annual Meeting except upon invitation of the Executive Committee or a Council Papers must be submitted to the Secretary of the Society of which the proposer is a member The proposer may request transfer to another program, but this may only be done with the consent of the Secretary of the Society concerned Any Secretary who regards any paper submitted to him as better suited to the program of another Society may arrange this transfer with the Secretary of the Society concerned, if it be possible Such transfer shall be indicated on the program

12 Abstracts not to exceed two hundred and fifty words in length, of papers approved for presentation at all of the scientific sessions of all the Constituent Societies at the Annual Meeting,

shall receive publication in the *Federation Proceedings*

13 A Control Committee, consisting of at least one representative of each Constituent Society as designated by the several Councils, shall have editorial control over the *Federation Proceedings* which shall be financed as required by an annual assessment of all the members of each Constituent Society

14 The Control Committee shall have power to choose certain additional papers presented at the Annual Meetings and from other sources, including material heretofore published in the *Federation Yearbook*, for publication in the *Federation Proceedings*

PLACEMENT SERVICE

The Federation maintains a service to act as a medium of communication between persons seeking positions for teaching or research and institutions that wish to fill vacancies in these sciences

The service does not undertake to recommend or to pass judgment upon applicants It aims merely to serve as a clearing-house for such information as above stated and to bring into touch with one another candidates for positions and employers

Individuals, whether members of the Federation or not, universities, other institutions and organizations desiring to avail themselves of the Service may receive such information as is available By action of the Executive Committee in 1947, a registration fee of one dollar is required of each applicant for a position

All communications should be addressed to Federation Placement Service, 2101 Constitution Ave , Washington 25, D C

THE AMERICAN PHYSIOLOGICAL SOCIETY

Founded December 30, 1887, Incorporated June 2, 1923

OFFICERS, 1949-1950

President—CARL J WIGGERS, Western Reserve University, Cleveland, Ohio

President-Elect—H C BAZETT, University of Pennsylvania, School of Medicine, Philadelphia

Past-President—MAURICE B VISSCHER, University of Minnesota, Minneapolis

Council—CARL J WIGGERS, H C BAZETT, MAURICE B VISSCHER, EDWARD F ADOLPH (1950), EUGENE M LANDIS (1951), D B DILL (1952), R W GERARD (1953)

Executive Secretary—M O LEE, 2101 Constitution Ave, Washington, D C

Board of Publication Trustees—W O FENN, *Chairman* (1952), R F PITTS (1950), FRANK C MANN (1951)

Representative on the Division of Biology and Agriculture, National Research Council—MAURICE B VISSCHER (1952)

Representative on the Division of Medical Sciences, National Research Council—HALLOWELL DAVIS (1950)

Representative on the Council of the American Association for the Advancement of Science—J H BODINE (1952), LEIGH CHADWICK (1952)

Historian—WALTER J MEEK

Contributing Editor to Scientific Monthly—JOHN FIELD II

CONSTITUTION

I

1 This Society shall be named "THE AMERICAN PHYSIOLOGICAL SOCIETY, INCORPORATED "

2 The Society is instituted to promote the advance of Physiology and to facilitate personal intercourse between American Physiologists

II

1 The Society shall consist of members and honorary members

2 Any person who has conducted and published meritorious original researches in Physiology and who is a resident of North America shall be eligible for membership in the Society

3 Members who have been relieved by the Council of the payment of the annual assessment shall retain all the rights of members

4 Distinguished men of science who have contributed to the advance of Physiology shall be eligible for election as honorary members of the Society. Honorary members shall pay no membership fee. They shall have the right of attending the meetings of the Society, and of taking part in its scientific discussions, but they shall have no vote

III

1 The management of the Society shall be vested in a Council consisting of a President-Elect, President, Past-President for the previous year, and four other members. The President-Elect and one member of the Council shall be chosen by ballot at each annual meeting. The President-Elect shall automatically assume the duties of President at the adjournment of the annual meeting following his or her election. The four additional members shall be elected for terms of four years and shall not be eligible to succeed themselves. A person who has once been President shall not be eligible for re-election as President-Elect. The Council shall have the power to elect its Secretary-Treasurer from among its own members. It shall also have the power to appoint and to compensate an Executive Secretary of the Society, who shall not be a voting member of the Council but shall assist it in carrying on the functions of the Society, including the receipt and disbursement of funds under the direction of the Council. If the annual meeting is not held all the members of the Council shall continue in office until their successors are chosen in the prescribed manner and succession

2 The Council shall have the power to fill all interim vacancies that may occur in its membership or in any Committee or board of the Society except those for which other provisions have been made

IV

1 At least a fortnight before the annual meeting the Secretary shall send to each member a notice of the place and time of each meeting, and shall make such other announcements as the Council shall direct

2 The annual assessment shall be determined by the Council, and shall be due in advance at the time of the annual meeting. No allocation or disbursement of funds of the Society shall be made except upon prior approval of the Council. Appropriations shall be made by the Council for the conduct of the necessary and appropriate business of the Society

3 Any member whose assessment is two years in arrears shall cease to be a member of the Society, unless at the next annual meeting he shall be reinstated by special vote of the Society, and it shall be the duty of the Treasurer to inform the Secretary that he may notify the said delinquent of his right to appeal to said meeting

4 Any member who has retired because of illness or age may, upon application to the Council, be relieved from payment of the annual assessment

V

1 Meetings of the Society for the conduct of business and the presentation of papers and demonstrations shall be held annually except for national emergencies or other exceptional circumstances when the Council may cancel the proposed meeting. The time and place of such meetings shall be determined by the Council in consultation with the Executive Committee of the Federation of American Societies for Experimental Biology

2 Special meetings may be held at such times and places as the Council may determine

VI

1 Proposed amendments to the Constitution must be brought up at one meeting for preliminary discussion and approval by a majority vote and cannot be adopted except by a two-thirds vote at a business session at the next annual meeting. Notice of such changes shall be sent to all members at least two weeks prior to the meeting at which they are scheduled for adoption

2 At all business meetings of the Society twenty-five members shall form a quorum

3 By-laws for the conduct of the Society may be adopted, altered, or repealed at any business meeting by two-thirds vote of the ballots cast

VII

1 The Council may, from the names of the candidates proposed in writing by at least two members of the Society, nominate candidates for election to membership. The names of the candidates so nominated and a statement of their quali-

fications for membership signed by their proposers shall be available for inspection during the business sessions of the Society at which their election is considered. The candidates may be balloted for at any session of the same meeting and a majority vote shall elect. If an annual meeting is not held, the Council shall elect the candidates to membership subject to Society approval at the next annual meeting.

2 Honorary members shall be proposed by the Council, and shall be elected by a majority ballot of the members present at an annual business session of the Society.

VIII

1 If a majority of the Council shall decide that the interests of the Society require the expulsion of a member, the Secretary shall send a notice of this decision to each member at least two weeks before the next annual meeting. At this meeting the Secretary shall on behalf of the Council, propose the expulsion, and if two-thirds of the members present vote for it, the member shall be expelled, and his assessment for the current year shall be returned to him, and he shall cease to be a member of the Society.

IX

1 The official organs of the Society shall be the *American Journal of Physiology*, the *Physiological Reviews* and such other publications as the Society shall establish. These the Society shall own and they shall be managed according to the provisions of Article X.

X

1 The President of the Society shall appoint, in consultation with the Council and subject to the approval of the Society, three members of the Society to serve as members of a Board of Publication Trustees.

2 The initial appointments shall be for one, two and three years. Thereafter, each member shall be appointed for three years, and shall be eligible for one immediate reappointment. He may be subse-

quently reappointed, but only after the lapse of at least one year between reappointments.

3 The Board of Publication Trustees shall be vested with full power of the Society to control and manage, both editorially and financially, all of the publications owned in whole or in part by the Society, to appoint editorial boards, to appoint and compensate a Managing Editor, and to control all publication funds, none of which, however, may be diverted from support of publications of the Society except by consent of the Council.

4 The Board of Publication Trustees shall make a full report to the Council at each annual meeting of the financial condition and publication policy of the Journals or other publications.

BY-LAWS

1 All papers read before the Society shall be limited to a length of ten minutes. No person may orally present more than one paper. In case of joint authorship the name of the individual who will orally present the paper shall stand first.

2 Abstracts in duplicate, not to exceed two hundred and fifty words in length, of all papers to be presented at the annual meeting of the Society shall be required by the Secretary for publication in the *Federation Proceedings*, in accordance with rules approved by the Council.

3 The Council shall upon the request of twenty-five members call a regional meeting of the Society at any time and place, for the reading of papers and the promotion of personal intercourse. Such a request shall be made in writing at least six weeks before the proposed date of meeting. Such meeting shall be held in accordance with the Constitution and By-laws of the Society, and if the regular officers of the Society cannot be present the President shall appoint a committee from among the petitioners to conduct the meeting. The Committee through a Secretary chosen by them shall forward an account of the scientific proceedings of the meeting to the official Secretary of the Society for insertion in the minutes.

4 No general business of the Society shall be transacted at such regional meetings.

AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS, INCORPORATED

Founded December 6, 1906, Incorporated September 12, 1919

OFFICERS, COMMITTEES AND REPRESENTATIVES FOR 1949-1950

President—CARL F CORI, Washington University School of Medicine, St Louis, Mo

Vice-President—HUBERT B VICKERY, Connecticut Agricultural Experiment Station, New Haven, Conn

Secretary—RICHARD W JACKSON, Northern Regional Research Laboratory, Peoria, Ill

Treasurer—E A EVANS, JR, University of Chicago, Chicago, Ill

Council—HANS T CLARKE, CARL F CORI, E A EVANS, JR, A BAIRD HASTINGS, RICHARD W JACKSON, J MURRAY LUCK, HUBERT B VICKERY

CONSTITUTION

FROM THE ARTICLES OF INCORPORATION

1 The name of the proposed corporation is "AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS, INCORPORATED"

2 The purposes for which this corporation is formed are to further the extension of biochemical knowledge and to facilitate personal intercourse between American investigators in biological chemistry

BY-LAWS

ARTICLE I—*Membership*

SECTION 1 *Eligibility for Membership*—Qualified investigators who have conducted and published meritorious original investigations in biological chemistry shall be eligible for membership in the Society

SEC 2 *Nomination*—Nominations for membership shall be made and seconded by members of the Society on blanks furnished by the Secretary. Nominations shall be submitted to the Council who shall determine eligibility and make recommendation to the Society at a regular meeting

SEC 3 *Election to Membership*—A A nominee for membership may be voted for by ballot at any meeting of the Society after the Council has reported its findings on his eligibility. The eligible candidate shall be reported by the Council as "eligible" or as "eligible and indorsed" B A majority of the ballots cast shall elect

SEC 4 *Forfeiture*—A Any member who may grant the use of his name for (a) the advertisement of a patent medicine, a proprietary food preparation, or any other commercial article of doubtful value to the public or possibly harmful to the public health, or (b) who may concede its use for the purpose of encouraging the sale of individual samples (of any such product) that he has not examined, shall forfeit his membership

B The Council shall have authority to announce forfeiture of membership, provided that the copy of the charges, together with a written notice of a hearing thereon by the Council at a place and time specified in such notice, shall have been delivered to the member charged with violating the preceding section either personally or mailed to him at his last known address at least thirty days before the date of such hearing

SEC 5 *Expulsion*—Upon the recommendation of the Council any member may be expelled by a majority vote of the total membership at a meeting of the Society, provided that a copy of the charges against him, together with a written notice of a hearing thereon by the Council at a place and time specified in such notice shall have been delivered to him personally or mailed to him at his last known address at least thirty days before the date of such hearing

ARTICLE II—*Meetings and Quorum*

SECTION 1 *Annual*—The annual meeting of the Society shall be held on the date fixed by the Certificate of Incorporation

SEC 2 *Special*—A special meeting may be called at any time by the President, or in case of his absence or disability, by the Vice-President, and must be called at the request of a majority of the Council or fifteen members of the Society. A notice specifying the purpose of such meeting shall be mailed to each member at least ten days previous thereto. The Council shall select the places at which meetings shall be held

SEC 3 *Quorum*—Fifteen members shall constitute a quorum at all meetings of the Society, but in absence of a quorum any number shall be sufficient to adjourn to a fixed date

ARTICLE III—*Officials*

SECTION 1 *Officers*—The officers shall be a President, a Vice-President, a Secretary, and a Treasurer, who shall be elected annually by the members of the Society

SEC 2 *Council*—A The officers so elected and three additional members, one of whom shall be elected at each annual meeting of the Society to serve a three year term, shall constitute the Board of Directors of the corporation and shall be known as "The Council" (When this provision is first put into effect three members will need to be elected for a one, a two and a three year period)

B No two members of the Council may be from the same institution, and none of the officers so elected shall be eligible for re-election for more than two years except the Secretary and Treasurer, who shall be eligible for re-election for five years. The three additional members of the Council shall be ineligible for re-election (until after the lapse of one year)

SEC 3 *Duties of Officers*—The powers and duties of the officers elected by the Society shall be such as usually devolve upon their respective positions

SEC 4 *Assistant Treasurer*—A The Council may from time to time appoint a trust company, or some member of the Society, to serve during the pleasure of the Council as Assistant Treasurer, and to act as depository of the investments and income of the "Christian A. Herter Memorial Fund" and of such other funds as the Society may from time to time commit to its or his charge

B The Assistant Treasurer shall have and exercise the following powers and duties, viz, the custody and safe-keeping of securities and cash belonging to the "Christian A. Herter Fund" and the collection of income and other moneys due to the Fund, with power to receipt for the same and to endorse for deposit all checks payable to the Society or the Treasurer, or to the Journal of Biological Chemistry for income or other moneys

due to the Fund, the investment or reinvestment of the capital of the Fund subject to the approval of the Council, the disbursement of principal under the direction of the Council and the disbursement of income under the direction of the Editorial Board of the Journal of Biological Chemistry, such disbursement to be made under a resolution of the Council or Board, or with the approval of two members of either the Council or Board, as the case may be. The Assistant Treasurer shall keep books of account and render statements, annually or oftener upon the request of the Council or Board setting forth the condition of the Fund and the receipts and disbursements since the date of the preceding statement.

ARTICLE IV — *The Council*

SECTION 1 *Powers* —The general management of the Society during the intervals between meetings shall be vested in the Council, which shall regularly perform the ordinary duties of an executive committee and possess all the powers conferred upon the Board of Directors of a membership corporation by the Membership Corporation Law of the State of New York.

SEC 2 *Reports* —The Council shall report to the Society as promptly as possible its findings on the eligibility of candidates for membership, and on all charges of a violation of these By-Laws.

SEC 3 *Journal of Biological Chemistry* —The Council shall have power to appoint the persons to act as proxies for the society at all meetings of the stockholders of the "Journal of Biological Chemistry" (a corporation) of which all the stock is owned by the Society, and also to designate the persons to be elected as Directors of such corporation.

SEC 4 *Herter Fund* —It shall be the duty of the Council to see that the "Christian A. Herter Memorial Fund" is administered in accordance with the terms of the Trust Agreement, Dated May 16, 1911, executed by the Journal of Biological Chemistry and the donors of said Fund.

ARTICLE V — *Nominating Committee*

SECTION 1 *Membership* —A The Nominating Committee shall consist of nine members from nine different institutions elected at each annual meeting to serve for the ensuing year. Members who have served on the Nominating Committee for two consecutive years shall be ineligible for re-election until after the lapse of one year.

B The member of the Nominating Committee who is elected to the Committee by the largest number of votes shall become Chairman and Secretary of the Committee.

SEC 2 *Nomination of Officials* —A The Nomi-

nating Committee shall make at least one nomination for each of the four offices and for each of the three additional positions in the Council to be filled by vote of the members.

B The nominations by the Nominating Committee must be transmitted to the Secretary at least one month before the annual meeting at which they are to be considered.

C The Secretary shall send to every member, at least two weeks before the annual meeting, two copies of the list of nominees presented to him by the Nominating Committee and at the same time shall notify all the members that they may vote by proxy.

D At the opening of the first executive session of the ensuing annual meeting the Secretary shall formally present the regular nominations for the Nominating Committee.

E Additional nominations for the offices and for membership in the Council may be made by any member at the opening of the first executive session of any annual meeting.

F Nominations for membership on the Nominating Committee shall be made by or for individual members, either in person or by proxy, and not otherwise, at the opening of the first executive session of any annual meeting.

SEC 3 *Election of Officials* —A The Secretary shall receive and present to the tellers, appointed by the President to take charge of the election, all signed ballots forwarded by absent members. When such ballots are presented to the tellers the Secretary shall announce the names of the members voting by proxy, and he shall record the same names in the minutes of the meeting.

B All elective officials shall be selected by ballot at the close of the first executive session of each annual meeting.

C A majority of the votes cast shall be necessary to elect an official.

D Elective officials shall take office on July 1st following the annual meeting.

SEC 4 *Filling of Vacancies* —A The Nominating Committee shall fill all vacancies in elective positions except such as may occur at a meeting of the Society.

B The President of the Society shall fill all vacancies in appointive positions.

ARTICLE VI — *Financial*

SECTION 1 *Dues* —Annual assessments shall be determined by majority vote at the annual meetings, upon the recommendation of the Council, and shall be due January 15th in each year. Members who have reached the age of 65 years, or who have become incapacitated, may, by vote of the Council, be exempted from the payment of dues.

SEC 2 *Expenditures* —No expenditures from the general funds of the Society except those required

in the performance of the ordinary official duties shall be made except by vote of the Society or the Council, but this section shall not apply to expenditures from the "Christian A. Herter Memorial Fund."

SEC 3 *Privileges of Membership Begin with Payment of Dues*—Candidates for membership, if elected, shall not be entitled to any of the privileges of membership, before they pay the dues of the fiscal year succeeding their election.

SEC 4 *Penalty for Non-Payment of Dues*—A Member in arrears for dues for a period of three consecutive years shall thereupon forfeit their membership.

B Delinquent members may be reinstated by the Council provided all indebtedness to the Society is liquidated.

SEC 5 *Herter Fund*—The "Christian A. Herter Memorial Fund" shall be held and invested separately from the general funds of the Society and the income thereof shall be expended under the direction of the Editorial Board exclusively for the maintenance and support of the Journal of Biological Chemistry, subject to the supervision and control of the Editorial Committee in accordance with the terms of the Trust Agreement mentioned in ARTICLE IV, SECTION 4, and the provisions of Article VII of the By-Laws.

ARTICLE VII—*Journal of Biological Chemistry*

SECTION 1 *Editorial Committee*—There shall be an Editorial Committee consisting of nine members of the Society who shall be nominated by the Nominating Committee and elected by the Society in the same manner as officers. The nine members first elected shall divide themselves by lot into three classes of three in each class, to serve for two, four, and six years respectively, and thereafter three members shall be elected at each alternate annual meeting of the Society to succeed the members of the outgoing class and to serve for a term of six years. Members of the Committee shall be eligible to re-election.

SEC 2 *Powers of Committee*—The Committee shall have power to elect an Editorial Board and shall have final authority in matters pertaining to the general policy of the Journal.

SEC 3 *Editorial Board*—The members of the Board shall hold office until their successors are elected and shall appoint a Managing Editor from among their own number who shall have direct responsibility and authority for the active editorial conduct of the Journal, and who shall have discretionary power in arranging the details as to the conduct of the Journal. The expenditures of the income of the "Christian A. Herter Memorial Fund" shall be under the direction of the Board,

and the approval of any two members of the Board shall be a sufficient warrant to authorize payments from such income.

ARTICLE VIII—*Papers on Scientific Subjects*

SECTION 1 *Presentation of Papers*—The Secretary shall request each member who signifies his intention of reading a paper at any session to specify the length of time which its presentation will require. The time thus specified shall be printed on the official program, and the presiding officer shall have no authority to extend it unless a majority of the members present signify their wish to the contrary. In the absence of any specification of time required not more than ten minutes shall be allotted for the reading of any one paper.

SEC 2 *Number of Papers*—No member shall be permitted to present more than one paper, either alone or in collaboration, until every member shall have had the opportunity of presenting one paper.

ARTICLE IX—*Corporate Seal*

SECTION 1 The corporate seal of the corporation shall be a circle surrounded by the words, "AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS," and including the word, "INCORPORATED."

ARTICLE X—*Amendments*

SECTION 1 *Amendments*—These By-Laws, after having been approved by the Council, and adopted by the Society at its first annual meeting, shall not be amended except as hereinafter provided.

SEC 2 *Manner of Presentation*—Proposed amendments to the By-Laws must be sent to the Secretary at least one month before the date of the meeting at which they are to be considered and must be indorsed in writing by at least three members.

SEC 3 *Notice of Intended Amendments*—The Secretary shall give every member notice of proposed amendments at least two weeks before the meeting at which they are to be considered and shall notify all members that they may vote by proxy.

SEC 4 *Adoption of Amendments*—A The Secretary shall receive and present to the tellers appointed by the President all signed ballots forwarded by absent members. When such ballots are presented to the tellers, the Secretary shall announce the names of members voting by proxy, and he shall record the same names in the minutes of the meeting.

B Votes upon amendments shall be cast at the opening of the second executive session of the meeting at which they are considered.

C Affirmative votes from three-fifths of the members voting shall be required for the adoption of an amendment.

AMERICAN SOCIETY FOR PHARMACOLOGY AND EXPERIMENTAL THERAPEUTICS, INCORPORATED

Founded December 28, 1908, Incorporated June 19, 1933

OFFICERS, 1949-1950

President—CARL F SCHMIDT, University of Pennsylvania School of Medicine, Philadelphia

Vice-President—J C KRANTZ, JR, University of Maryland Medical School, Baltimore

Secretary—HARVEY B HAAG, Medical College of Virginia, Richmond

Treasurer—K K CHEN, Lilly Research Laboratories, Indianapolis, Ind

Council—THOMAS C BUTLER, ARTHUR C DEGRAFF, ROBERT A WOODBURY, CARL F SCHMIDT, J C KRANTZ, JR, HARVEY B HAAG, K K CHEN

Membership Committee—ROBERT P WALTON (1950), JOHN C KRANTZ, JR (1951), J H COMROE, JR (1952)

Nominating Committee—OTTO KRAYER, *Chairman*, W T SALTER, WALTON VAN WINKLE, JR, ALFRED GILMAN, M H SEEVERS

Historian—WILLIAM DEB MACNIDER

Committee on International Pharmacological Congress—M L TAINTER, *Chairman*, OTTO KRAYER, H B VAN DYKE

CONSTITUTION

ARTICLE I—Name

The name of this organization shall be the "AMERICAN SOCIETY FOR PHARMACOLOGY AND EXPERIMENTAL THERAPEUTICS, INCORPORATED"

ARTICLE II—Objects

The purpose of this Society shall be to promote these branches of science and to facilitate personal intercourse between investigators who are actively engaged in research in these fields

ARTICLE III—Membership

SECTION 1 Any person who has conducted and published a meritorious investigation in pharmacology or experimental therapeutics, and who is an active investigator in one of these fields, shall be eligible to membership, subject to the conditions of the other sections of Article III

SEC 2 A Candidates for membership to this Society shall be proposed by two members who are not members of the Council The names so proposed shall be sent to the Secretary at least three months prior to the Annual Meeting

B The Membership Committee shall investigate the qualifications of the candidates and report to the Council

C Candidates reported upon by the Membership Committee to the Council may be recommended for admission by the Council only provided they have been approved by four-fifths of the combined membership of the Membership Committee and the Council

D The names of the candidates recommended for admission by the Council shall be posted by the Secretary not later than the day preceding the election for members

E The election of members shall be by individual ballot, one opposing vote in every eight cast shall be sufficient to exclude a candidate from membership

SEC 3 Forfeiture of Membership

A Any member whose assessment is three years in arrears shall cease to be a member of the Society, unless he shall be reinstated by a special vote of the Council, and it shall be the duty of the Treasurer to inform the Secretary that he may notify the said delinquent of his right to appeal to the Council

B If the Council shall decide that it is for the best interests of the Society that a member be expelled, the member shall be notified and given an opportunity of a hearing before the Council Upon the recommendation of the Council the member then may be expelled by a three-fourths vote of those present at a regular meeting of the Society

SEC 4 Honorary Members

A Distinguished men of science who have contributed to the advance of pharmacology or experimental therapeutics shall be eligible for election as honorary members of the Society

B Nominations for honorary members shall take the same course as nominations for ordinary members (Art III, Sec 2), but their election shall require the unanimous vote of the members present at the election

C Honorary members shall pay no membership fee They shall have the right to attend all meet-

ings of the Society, and to take part in its discussions, but they shall have no vote

D The conditions for continuation of membership shall be the same for honorary as for ordinary members (Art III, Sec 3), except that forfeiture for arrears of fees does not apply to honorary members

ARTICLE IV—*Officers and Elections*

SECTION 1 *Officers and Committees*

A The management of the Society shall be vested in a Council of seven officers, consisting of the President, Vice-President, Secretary, and Treasurer of the Society, and three Councilors-at-Large

B The four ex officio members shall serve for one year but shall be eligible for re-election

C The three Councilors-at-Large shall serve for a period of three years, and shall not be eligible for immediate re-election

D At the first meeting of the Society under this amended Constitution one Councilor-at-Large shall be elected to serve for a period of three years, one for two years, and one for one year, and subsequently one Councilor-at-Large shall be elected annually to serve for a period of three years

E There shall be a Membership Committee, consisting of three members. No two members shall be from the same institution. The election of the Membership Committee shall be held annually at the time when the election of officers occurs. At the first meeting of the Society under this constitution, one member shall be elected to serve on the Committee for three years, one for two years, and one for one year, and subsequently one member shall be elected each year to serve for a period of three years

F There shall be a Nominating Committee of five members. No two members shall be from the same institution. Members of the Nominating Committee shall serve for one year. They are eligible for re election, but shall not hold membership in the Committee for more than two consecutive years

SEC 2—*Nomination of Officials and Committeemen*

A The Nominating Committee shall make at least one nomination for each office and for the position on the Membership Committee to be filled by vote of the members. The nominations so made shall be transmitted to the Secretary and by him in turn to the members, at least one month before the annual meeting

B Nominations for membership on the Nominating Committee shall be made by individual members at the time of the annual election. The five nominees who receive the highest numbers of votes shall be declared elected. The Nominating

Committee shall select its own Chairman who shall serve as Secretary to the Committee

SEC 3 *Election of Officials and Committeemen*

A At the opening of the first executive session of the annual meeting the Secretary shall give to each member present a printed ballot showing the nominations of the Nominating Committee. After accepting additional nominations from individual members present a complete list of nominees shall be posted. A preliminary vote shall then be taken and the tellers, appointed by the President to conduct the election, shall post immediately a final list showing the two nominees for each office receiving the highest number of votes. At the close of the first session, a final vote shall be taken. A majority of votes cast shall be necessary to a choice

B Such vacancies as may occur in the offices and in the various committees in the interval between annual meetings shall be filled by a majority vote of the Council

ARTICLE V—*Meetings*

SECTION 1 The annual meeting of the Society shall be held at a time and place determined by the Council in consultation with the Executive Committee of the Federation of American Societies for Experimental Biology

SEC 2 Special meetings may be held at such times and places as the Council may determine

SEC 3 At least four weeks before the annual meeting the Secretary shall send to each member a notice of the time and place of such meeting and shall make such announcements as the Council may direct

ARTICLE VI—*Financial*

SECTION 1 The annual assessment shall be determined by majority vote at the annual meetings, upon the recommendation of the Council, and shall be due in advance at the time of the meeting

SEC 2 Beyond the ordinary expenditures required by the routine business of the Society no money shall be disbursed save by the authority of the Council or Society

SEC 3 The treasurer shall make an annual report to the Society

SEC 4 All publication funds shall be kept in a separate account, subject to the control of the Board of Publications Trustees except that none of these funds may be diverted from the support of publications of the Society except by consent of the Council or the Society. A financial report shall be made by the Board at each annual meeting

ARTICLE VII—*Quorum*

Ten members shall constitute a quorum for the transaction of business

ARTICLE VIII — *By-Laws*

By-Laws shall be adopted, altered or repealed at any meeting by two-thirds vote of the ballots cast

ARTICLE IX — *Amendments*

SECTION 1 Intended amendments to the Constitution shall be sent to the Secretary at least one month before the date of the meeting at which they are to be considered, and must be indorsed in writing by at least three members

SEC 2 The Secretary shall give all members due notice of proposed amendments

SEC 3 A four-fifths vote of the members present shall be required for the adoption of an amendment

ARTICLE X — *Official Publications*

SECTION 1 The President of the Society shall appoint, in consultation with the Council, and subject to the approval of the Society, three members of the Society to serve as members of a Board of Publications Trustees, these members shall elect a Managing Editor for each of the official journals of the Society, and each Managing Editor, during the term of his service, shall act as an additional voting member of the Board of Publications Trustees and shall participate in all the activities of the Board except that of election of managing editors of the journals of the Society

SEC 2 The members of the Board of Publications Trustees, hereinafter termed "The Board," shall each serve for a term of three years, shall be subject to reappointment, and may hold office concurrently in the Society. At the first appointment, however, one member shall be appointed for three years, one member for two years, and one member for one year, in order that in the future, appointments may be made annually in rotation. The Board shall meet at least once annually (a quorum shall consist of three members) and shall report directly to the Society

SEC 3 The special functions of The Board shall be to consider and to investigate thoroughly all matters pertaining to the fiscal and editorial policies of the journals which may come to the Society or to its Council, to the Managing Editors, and to

the members of The Board. The Board shall (1) administer the finances of the journals, (2) establish the publication policies of the journals, and (3) elect a Managing Editor for each of the journals of the Society (as described in Sec 1)

SEC 4 The Managing Editor of each journal shall nominate to The Board, members of the Society acceptable to him as Associate Editors. From those nominated, The Board shall elect, for each journal, Associate Editors in such number as they shall consider adequate to fulfill the duties of that Editorial Board. The Managing Editor and each Associate Editor shall serve for three years, subject to reappointment, and may hold office concurrently in the Society. In the choice of The Boards of Editors, The Board is charged with the responsibility of obtaining editors with expert knowledge in the several fields of pharmacological research and with evidenced ability for critical and grammatical expression

SEC 5 The Boards of Editors of the journals shall meet on call of the respective Managing Editor, if possible just prior to or during the regular meetings of the Society, and may make recommendations to The Board concerning the improvement of the publication policies of the journals

BY-LAWS

1 Papers to be read shall be submitted by the members of the Society to the Secretary, who, with the President, shall be empowered to arrange the program. No person may orally present more than one paper. In case of joint authorship, the name of the individual who will orally present the paper shall stand first. Papers not read shall appear on the program as read by title

2 An abstract of a paper to be read before the Society shall be sent to the Secretary with the title. As early as possible after each meeting, the Secretary shall edit and publish the Proceedings of the Society together with abstracts in a publication authorized by the Society

3 All applications for membership shall be accompanied by a copy of as many reprints as possible of the published work of the applicant

4 Any member who has been an active member for thirty years, or who has retired for disability or age, may upon notification to the Treasurer be relieved from payment of dues

THE AMERICAN SOCIETY FOR EXPERIMENTAL PATHOLOGY

Founded December 29, 1913

OFFICERS, 1949-1950

President—JOHN G KIDD, Cornell University Medical College, New York City

Vice-President—JAMES F RINEHART, University of California Medical School, San Francisco

Secretary - Treasurer—SIDNEY C MADDEN, Brookhaven National Laboratory, Upton, Long Island, N Y

Councilors—F S ROBSCHT-ROBBINS, D MURRAY ANGEVINE, JOHN G KIDD, JAMES F RINEHART, SIDNEY C MADDEN

Representative on the Division of Medical Sciences of the National Research Council—JOHN G KIDD (1949-1952)

Representatives on the Council of the American Association for the Advancement of Science—MALCOLM H SOULE, E B KRUMBHAAR (1949-1952)

Representatives on the Eli Lilly Award Committee (jointly with the Society of American Bacteriologists)—*For nominations* PAUL R CANNON (1951), S BURT WOLBACH (balance of 1949) *For award* PEYTON ROUS (1951), JOHN G KIDD (balance of 1949)

Representative on the Committee for the Placement Service—DOUGLAS H SPRUNT

PAST OFFICERS

CONSTITUTION

ARTICLE I—*Name*

The Society shall be named "THE AMERICAN SOCIETY FOR EXPERIMENTAL PATHOLOGY"

ARTICLE II—*Object*

The object of this Society is to bring the productive investigators in pathology, working essentially by experimental methods, in closer affiliation with the workers in the other fields of experimental medicine

ARTICLE III—*Time and Place of Meeting*

The Society shall meet at the same time and place as the Federation of American Societies for Experimental Biology, which comprises at present the American Physiological Society, the American Society of Biological Chemists, the American Society for Pharmacology and Experimental Therapeutics, the American Society for Experimental Pathology, the American Institute of Nutrition and the American Association of Immunologists

ARTICLE IV—*Membership*

SECTION 1 Any American investigator who, through the use of experimental methods, has, within three years prior to his candidacy, contributed meritorious work in pathology, is eligible to membership

SEC 2 It shall be the policy of the Society to restrict its membership to as small numbers as is compatible with the maintenance of an active existence

SEC 3 There shall be two classes of members active and honorary members

Active members Candidates for active membership shall be nominated at or before an annual meeting by two members of the Society. The nominators shall present to the Secretary in writing evidence of the candidate's qualifications for membership. Nominations approved by the Council shall be presented to the Society for election at the next annual meeting following nomination. For election a favorable ballot by a majority of the members present is necessary.

Honorary members These may be elected from the active list or from the group of distinguished investigators at home or abroad who have contributed to the knowledge of pathology by experimental study. They shall be elected only by the unanimous vote of the members present at time of nomination.

SEC 4 Active members shall pay such annual dues as are determined upon, from year to year, by the Council. Honorary members shall pay no dues, are not eligible to office, and have no vote in the business affairs of the Society, but they shall have all the privileges of the active members in the scientific proceedings.

SEC 5 Upon failure of an active member to pay dues for two years, notice shall be given to the member by the Secretary. At the end of the third year, if dues are still unpaid, such failure constitutes forfeiture of membership.

SEC 6 A motion for expulsion of a member must be thoroughly investigated by the Council, at this investigation the accused shall be afforded a hearing or may be represented by a member. Expulsion can be accomplished only after a unanimous vote by the Council in favor of expulsion, sustained by a four-fifths vote of the members present at the meeting.

ARTICLE V—*Officers*

The management of the Society shall be vested in a Council of five members, consisting of a President, a Vice-President, a Secretary-Treasurer, and two other members who shall be nominated by the Council and elected by the Society. Officers are elected by a majority vote and remain in office until July 1 following the Federation Meeting.

Vacancies shall be filled by the Council for the unexpired term

The President and Vice-President shall hold office for one year and are ineligible for re-election during the following year The Secretary-Treasurer is eligible for re election Councilors shall hold office for two years and are elected on alternate years At the first election one Councilor shall be elected for a short term of one year

ARTICLE VI —*Quorum*

SECTION 1 —Three constitute a quorum of the Council The Council decides by a majority vote

SEC 2 A Quorum of the Society for transaction of business shall be one-fourth of the total membership In all questions brought before the Society a majority vote of those present shall decide, except as elsewhere provided for

ARTICLE VII —*Annual Meeting*

SECTION 1 Papers shall be limited to ten minutes However, on motion and with unanimous consent, the time may be prolonged by a period not exceeding five minutes The Council may make provision for longer papers on suitable occasions

SEC 2 The subjects of papers must be confined to experimental work in pathology In doubtful cases a liberal interpretation by the President and Secretary may prevail The Council may invite, however, presentations dealing with any subject which it considers of considerable interest to the Society

ARTICLE VIII —*Change of Constitution*

A motion concerning a change of the Constitution must be presented to the Council in writing by three members, and must be communicated to the members by the Secretary at least four weeks before the annual meeting At this meeting such a change may be established when accepted by a four-fifths vote of the members present

BY-LAWS

1 There must be in each year at least one meeting of the Council, which shall take place not later than the evening before the annual meeting

2 At the end of the first session of the annual meeting the Secretary shall read the report of the Council This report shall include (1) names of persons recommended for membership, (2) nominations for offices, (3) matters of general interest The Secretary shall exhibit in a conspicuous place the names of candidates for membership recommended by the Council, together with the evidence of the qualifications of the candidates

3 The election of officers and of new members, changes in the Constitution, etc, shall be voted upon at the end of the first session

4 Changes in the By-Laws may be determined by a majority vote of those present

5 In the year that a new Secretary-Treasurer is elected the incoming Council Member elected that year, or another member of the Council, shall become Assistant Secretary-Treasurer for the duration of the term of the Secretary-Treasurer

AMERICAN INSTITUTE OF NUTRITION

Founded April 11, 1933, Incorporated November 16, 1934

Member of Federation 1940

OFFICERS, 1949-1950

President—C G KING, Nutrition Foundation, Inc., New York City

Vice-President—W H GRIFFITH, University of Texas Medical School, Galveston

Secretary—J H ROE, George Washington University School of Medicine, Washington, D C

Treasurer—N R ELLIS, Bureau of Animal Industry, U S Department of Agriculture, Beltsville, Md

Councilors—A D HOLMES, E N TODHUNTER, A H SMITH, C G KING, W H GRIFFITH, J H ROE, N R ELLIS

Nominating Committee—ICIE MACY HOOBLER, *Chairman*, E W CRAMPTON, H J DEUEL, JR., L A MAYNARD, F J STARE

Committee on Rules for Awards—W C RUSSELL, *Chairman*, H E CARTER, R R SEALOCK, C D TOLLE, J WADDELL

Committee on Program Policy—W H GRIFFITH, *Chairman*, G R COWGILL, F S DAFT, R M LEVERTON, E W MCHENRY

Committee on Registry of Nutritional Pathology—R E JOHNSON *Chairman*, O A BESSEY, P L PHILLIPS, W H SEBRELL

Representatives on Committee on Biochemical Nomenclature (joint with American Society of Biological Chemists)—H J ALMQUIST, C A ELVEHJEM

CONSTITUTION

1 The name of the proposed society is the "AMERICAN INSTITUTE OF NUTRITION"

2 The purposes of the society are to further the extension of the knowledge of nutrition and to facilitate personal contact between investigators in nutrition and closely related fields of interest

3 The management of the American Institute of Nutrition shall be vested in a council consisting

of the President Vice-President, Secretary, Treasurer and three additional members

BY-LAWS

ARTICLE I—*Membership*

SECTION 1 *Eligibility for membership* Members Qualified investigators who have independently conducted and published meritorious original investigations in some phase of the chemistry or physiology of nutrition and who have shown a professional interest in nutrition for at least 5 years shall be eligible for membership in the Society

SEC 2 *Nomination* Nominations for membership shall be made and seconded by members of the Society on blanks furnished by the Secretary. Nominations shall be submitted to the Council who shall determine eligibility and make recommendation to the Society at a regular meeting

SEC 3 *Election to membership* A A nominee for membership may be voted for by ballot at any meeting of the Society after the Council has reported its findings on his eligibility B A majority of the ballots cast shall elect

SEC 4 *Forfeiture* If a majority of the Council after due notice to the member in question and opportunity for a hearing, shall decide that the interests of the Society require the expulsion of a member, the Secretary shall send a notice of this decision to each member at least two weeks before the next annual meeting At this meeting the Secretary shall, on behalf of the Council, propose the expulsion, and if two-thirds of the members present vote for it, the member shall be expelled, his assessment for the current year shall be returned to him, and he shall cease to be a member of the Society

ARTICLE II—*Meetings and Quorum*

SECTION 1 *Annual* The annual meeting of the Society shall be held on the date fixed by the Certificate of Incorporation

SEC 2 *Special* A special meeting may be called at any time by the President, or in case of his absence or disability, by the Vice-President, and must be called at the request in writing of a majority of the Council or fifty members of the Society Notice specifying the purpose of such meeting shall be mailed to each member at least ten days previous thereto The Council shall select the places at which meetings shall be held

SEC 3 *Quorum* Thirty members shall constitute a quorum at all meetings of the Society, but in the absence of a quorum any number shall be sufficient to adjourn to a fixed date

ARTICLE III—*Officials*

SECTION 1 *Officers* The officers shall be a President, and a Vice-President, who shall be elected

annually, and a Secretary and Treasurer, each of whom shall be elected to serve for a term of three years These officers shall be elected by the members of the Society Their terms of office shall commence on July 1 of the year in which they are elected

SEC 2 *Council* The officers so selected and three additional members, one of whom shall be elected at each annual meeting to serve a term of three years, shall constitute a Board of Trustees and shall be known as "The Council" (When this provision is first put into effect one member shall be elected for 1 year, one for 2 years and the third for 3 years)

SEC 3 *Duties of Officers* The powers and duties of the officers elected by the Society shall be such as usually devolve upon their respective positions

ARTICLE IV—*The Council*

SECTION 1 *Powers* The general management of the Society during the intervals between meetings shall be vested in the Council, which shall regularly perform the ordinary duties of an executive committee and possess all the powers conferred upon the Board of Trustees of an educational institution chartered by the Education Department of the University of the State of New York A permanent charter was issued to the American Institute of Nutrition under date of November 16, 1934

SEC 2 *Reports* The Council shall report to the Society its findings on the eligibility of candidates for membership, and on all charges of a violation of these By-Laws

ARTICLE V—*Nominating Committee*

SECTION 1 *Membership* A The Nominating Committee shall consist of five members appointed for the coming year by the retiring President Members who have served on the Nominating Committee for two consecutive years shall be ineligible for reappointment until after a lapse of one year B The President shall designate one member to be Chairman of the Nominating Committee

SEC 2 *Nomination of Officials* A The Nominating Committee shall make at least one nomination for each of the four offices, for each of the additional positions on the Council to be filled by vote of the members and for each of the positions on the Editorial Board to be vacated at the time of the annual meeting Any member of the Institute may submit nominations to the Nominating Committee for its consideration along with those nominations made by the members of the Nominating Committee B The nominations by the Nominating Committee shall be transmitted to the Secretary at least six weeks before the annual meeting at which they are to be considered C The Secretary shall send to every member, at least two weeks before

the annual meeting, a printed ballot containing the list of nominees and space for such additional names as the member wishes to propose, and at the same time shall notify the members that they may vote by mail, returning to the Secretary the marked ballot in the envelope provided, at such a time and place as the Secretary may designate, or the ballot may be delivered to the Secretary at the beginning of the business session at which the elections are to take place

SEC 3 *Election of Officials* A At the beginning of the business session the Secretary shall present to the tellers, appointed by the President, the ballots submitted by the members and the ballots shall be counted forthwith B A majority of votes cast shall be necessary to elect an official

SEC 4 *Filling of Vacancies* A The Nominating Committee shall fill all vacancies in elective positions except such as may occur at a meeting of the Society B The President of the Society shall fill all vacancies in appointive positions

ARTICLE VI—*Financial*

SECTION 1 *Dues* The dues shall be the annual cost of subscription to *The Journal of Nutrition* for members plus an annual assessment which shall be determined by majority vote at the annual meetings, upon recommendation of the Council, and shall be due within a month after the annual meeting A member on attaining the age of 65 may elect to be relieved from all financial obligations to the Institute including subscription to *The Journal of Nutrition*

SEC 2 *Expenditures* No expenditures from the general funds of the Society except those required in the performance of the ordinary official duties shall be made except by vote of the Society or the Council

SEC 3 *Penalty for non-payment of dues* A Members in arrears for dues for two consecutive years shall forfeit their membership B Delinquent members may be reinstated by the Council provided all indebtedness to the Society is liquidated

ARTICLE VII—*The Journal of Nutrition*

SECTION 1 The American Institute of Nutrition designates *The Journal of Nutrition* as its official organ of publication

SEC 2 In accordance with the expressed wish of the Wistar Institute of Anatomy and Biology, owner and publisher of *The Journal of Nutrition*, the American Institute of Nutrition shall nominate members of the Editorial Board for its official organ A The editorial management of *The Journal of Nutrition* shall be vested in an Editorial Board consisting of an Editor and twelve Board Members B The Editor shall be chosen by the Editorial Board to serve a term of five years beginning July 1 of the year in which he is chosen, and shall be eligible for reelection The Editor shall have the power to designate one of the Board Members to serve as his assistant, and such an appointee shall be called Associate Editor C Three members of the Institute shall be nominated by the Nominating Committee for membership on the Editorial Board each year to serve a term of four years, replacing three retiring members and taking office May 1 of the year in which they are elected In the event of a vacancy in the membership of the Editorial Board occurring through death or other reason, the Nominating Committee, for each such vacancy to be filled shall make an additional nomination In this event the nominees elected who receive the greatest number of votes shall serve the longest term of vacancies to be filled D Retiring members of the Editorial Board shall not be eligible for renomination until one year after their retirement

ARTICLE VIII—*Papers on Scientific Subjects*

SECTION 1 The Secretary shall be authorized to arrange programs for the scientific sessions at the annual meetings

ARTICLE IX—*Changes in Constitution and By-Laws*

SECTION 1 Proposed changes in the Constitution and By-Laws must be sent in writing to the Secretary at least one month before the date of the meeting at which they are to be considered, and must be signed by at least three members The Secretary shall send a printed copy of any proposed change to each member at least two weeks before the next meeting and shall notify all members that they may vote by proxy

SEC 2 If at this meeting two-thirds of the votes cast shall favor the proposed change, it shall be made

THE AMERICAN ASSOCIATION OF IMMUNOLOGISTS

Founded June 19, 1913, Member of Federation 1942

OFFICERS, 1949-1950

President—THOMAS FRANCIS, JR., School of Public Health, Ann Arbor, Mich

Honorary President—ARTHUR F COCA, Oradell, N J

Vice President—MICHAEL HEIDELBERGER, College of Physicians and Surgeons, New York City

Secretary Treasurer—JULIUS FREUND, Public Health Research Institute, New York City

Council—JACQUES J BRONFENBRENNER, GEORGE EDSELL, COLIN MACLEOD, KARL F MEYER, SANFORD B HOOKER, *ex officio*, THOMAS FRANCIS, JR., MICHAEL HEIDELBERGER, JULIUS FREUND

CONSTITUTION

(As revised, 1949)

ARTICLE I—Name

This association shall be called THE AMERICAN ASSOCIATION OF IMMUNOLOGISTS

ARTICLE II—Object

The purpose of the Association shall be to advance knowledge of immunology and related disci-

plines, and to facilitate interchange of ideas and information among investigators in the various fields

ARTICLE III—Members

SECTION 1 The Association shall consist of active members, members emeriti and honorary members

SECTION 2 Any qualified person engaged in the study of problems related to the purpose of the Association may apply for active membership. Candidates for active membership shall be nominated by two members of the Association on blanks furnished by the Secretary. Applications must be accompanied by letters of recommendation of the sponsors, a curriculum vitae, and a list of reprints of publications. The Council shall determine eligibility and post a list of candidates at the annual meeting. The membership shall elect new members by majority vote.

SECTION 3 Failure to pay dues for three successive years shall annul membership. The Council may reinstate a member if an acceptable explanation is submitted and all indebtedness to the Association is liquidated. Payment of such indebtedness may be waived by unanimous vote of the Council if circumstances justify such action.

SECTION 4 If a two thirds majority of the Council decides that the best interests of the Association require the expulsion of a member, the Secretary shall notify the affected member in writing of the charges. The Council shall allow a reasonable time for the presentation of his defense before acting. Upon recommendation of a two thirds majority of the Council, the Secretary shall send a notice of the decision to each active member at least six weeks before the next annual meeting. At this meeting the Secretary shall, on behalf of the Council, propose the expulsion, and on a two thirds vote of the members present, the member shall be expelled, his assessment for the current year shall be returned, and he shall cease to be a member of the Association.

SECTION 5 An active member of the Association for twenty years upon retirement because of age or disability, may elect to accept the status of member emeritus. As such he shall retain voting privileges but shall be relieved of all financial obligations to the Association and shall not receive the Journal without payment.

SECTION 6 The Council may nominate for honorary membership persons of extraordinary achievement in the field of endeavor of this Association. Election to honorary membership shall follow the same procedure as that for election for

office in the Association, and the Secretary, on order of the Council, shall place nominations for honorary membership on the annual ballot

ARTICLE IV—*Officers*

SECTION 1 The Association shall be governed by a Council, which shall consist of the Officers of the Association and five Councilors, one of whom shall be the Editor-in-Chief of the Journal of Immunology

SECTION 2 The Officers of the Association shall be a President, a Vice President, a Secretary, and a Treasurer. The duties of the two latter may be performed by one or two individuals as determined by vote of the Association (See By-Law # 7)

SECTION 3 The President, the Vice President, the Secretary, and the Treasurer shall be elected at the regular annual meeting of the Association to serve for one year. Only the Secretary and the Treasurer are eligible to serve for successive terms in their respective offices. The term of office shall begin the day after the end of the annual meeting.

SECTION 4 One Councilor shall be elected each year to serve for a term of four years. He may however serve in any other elective office immediately after expiration of his term as Councilor.

SECTION 5 The President shall appoint a Nominating Committee of three (or more) members not currently serving on the Council of the Association and shall designate the Chairman. The Committee shall submit nominations for the offices of President, Vice President, Secretary, Treasurer, and Councilor. They may nominate the member currently serving as Vice President for the office of President, and the Councilor who is serving his fourth year for the office of Vice President. They shall submit the names of three members of the Association as candidates for the office of Councilor for a four-year term. The Nominating Committee shall confer at least three months before the annual meeting and shall transmit its nominations, over the signatures of the majority of the Committee, to the Secretary at least two months before the annual meeting. Other names may be added to the ballot upon petition of at least twenty-five members of the Association to the Secretary at least two months before the annual meeting. The Secretary shall send to each member of the Association, at least six weeks before the annual meeting, a ballot containing the list of all such nominees.

SECTION 6 The members of the Association shall vote on the nominations by secret ballot by mail. All ballots must be in the hands of the Secretary one week before the annual meeting. At the time of the annual meeting the Secretary shall present all the valid sealed ballots received by him to the tellers appointed by the President. A plurality of votes shall be sufficient for election.

SECTION 7 The Vice President shall substitute

for the President when necessary. If both the President and Vice President are unable to serve, the senior Councilor shall temporarily assume the duties of President. Should a vacancy occur in the office of Secretary or Treasurer, or Councilor, the Council by a majority vote shall appoint a member to fill the unexpired term until the following election. In the event of a vacancy in the Council, the members shall in the following election choose two Councilors from among six nominees whose names shall be selected by the Nominating Committee and included on the ballot as above. Moreover, in this event the terms of the four Councilors shall be adjusted so as to provide an orderly progression within the general sense of the Constitution.

ARTICLE V—*Meetings*

SECTION 1 A regular meeting of the Association shall be held annually at such time and place as the Council shall determine. Regular meetings shall be open to all members of the Association. The members present at the annual meeting of the Association shall constitute a quorum.

SECTION 2 A meeting of the Council shall be held prior to the annual business meeting of the Association. A quorum of the Council for this meeting shall be five.

SECTION 3 In case of equal division of votes, the President shall cast the decisive ballot.

SECTION 4 Minutes of the annual meeting of the Council and of the annual business meeting of the Association shall be published in the form of a news-letter and be distributed only to members of the Association. The annual report of the Treasurer shall be included in this news-letter.

ARTICLE VI—*Business*

SECTION 1 The fiscal year of the Association shall begin March first.

SECTION 2 Annual dues, upon recommendation of the Council, shall be determined by a majority vote at the annual meeting of the Association.

ARTICLE VII—*Publication*

SECTION 1 The Journal of Immunology, which is the property and official organ of this Association, shall be administered for the Association by an Editorial Board.

SECTION 2 An Editor-in-Chief shall be elected from the membership by a majority vote of the Council to serve for four years. His term of office shall be subject to renewal. He shall appoint with the consent of the Council an Editorial Board of four to six members to serve for four years. The Editor-in-Chief and the members of the Editorial Board shall be responsible for the editorial conduct of the Journal.

SECTION 3 The Editor-in-Chief shall, with the consent of the Council, appoint from the active

members Associate Editors as needed These Associate Editors are to be chosen because of their ability in specialized fields

SECTION 4 The Editor-in-Chief shall make a report of his stewardship of the Journal at the annual meeting and in this report shall summarize the editorial situation and all matters dealing with finances He shall submit to the Council statements relating to the number of manuscripts received, rejected, accepted, and published during the year, changes in editorial personnel of editors, a complete summary of circulation and of finances and of any other information which the Editorial Board may feel to be pertinent or which may be required by the Council

ARTICLE VIII—*Amendments*

SECTION 1 Proposed changes in the Constitution shall be submitted by at least five members in writing through the Secretary to the President The President shall then appoint a committee of at least three members which shall communicate its recommendations to the President for consideration by the Council The Council shall then advise the Secretary to submit the recommendations of the committee to the membership of the Association for approval with the annual ballot A change in the Constitution shall require a two-thirds majority of the votes cast by the members at the annual meeting and shall require confirmation by a majority in a mail vote in which at least 50% shall have participated

SECTION 2 As an alternative procedure a proposed change in the Constitution may be submitted directly to the Council by petition of one-tenth of the total active membership Under this circumstance the Council is required to arrange for a vote by the members as heretofore described

SECTION 3 Proposed changes in By-Laws may be adopted by two-thirds vote of members present at the annual meeting

BY-LAWS

1 The Past Presidents shall have the right of attending, without vote, the meetings of the Council

2 The President may appoint a Past President

or a Past Councilor as pro tempore Councilor at any stated meeting of the Council at which a quorum is not present

3 The Council may transact and vote by mail on such business as cannot be conveniently transacted at meetings

4 The Secretary shall arrange the program for the scientific meetings, with the advice of the other officers of the Association Any member in good standing shall have the right to submit a paper The privilege of presentation may be extended to non-members upon recommendation of active members Papers intended for presentation at the meetings shall conform to the standards of the Journal of Immunology In case of doubt, the Secretary shall have the right to submit papers to the scrutiny of three or more members of the Editorial Board of the Journal of Immunology whose decision shall be final

5 Each member who signifies his intention of reading a paper at any session may specify the length of time which its presentation shall require In the absence of any specification of time required not more than ten minutes shall be allotted for the reading of any one paper The time allotted shall be printed on the official program, and the presiding officer shall have no authority to extend it unless a majority of the members present signify their wish to the contrary

6 If by force of circumstances it should be impossible to hold the annual meeting, the election of Officers and Council may be carried out entirely by mail

7 The offices of Secretary and Treasurer are combined and shall be held by one person

8 Official or invited addresses presented at the annual meeting shall be given immediate priority in publication, unless the Editor-in-Chief shall be otherwise instructed by majority vote of the Council

9 Dues are payable on or before January 1st and subscriptions to the Journal will be lapsed if not paid by this date

10 If the Editor-in-Chief is unable to attend the stated meeting of the Council, he may designate an alternate from the membership of the Editorial Board

ALPHABETICAL LIST OF MEMBERS OF THE SIX SOCIETIES

- (1) The American Physiological Society
- (2) American Society of Biological Chemists
- (3) The American Society for Pharmacology and Experimental Therapeutics
- (4) The American Society for Experimental Pathology
- (5) The American Institute of Nutrition
- (6) The American Association of Immunologists

Number and year in parentheses following each name indicate Society affiliation and year of election

HONORARY MEMBERS

- Adrian, E D** Cambridge University, Dept of Physiology, Cambridge, England (1, 1946)
- Castaneda, M Ruiz, M D** Investigaciones Medicas, Hospital General, Mexico, D F *Director, Department of Medical Research* (6, 1942)
- Chopra, R N, M D, Sc D** School of Tropical Medicine, Calcutta, India *Director, Professor of Pharmacology* (3, 1938)
- Coca, Arthur F, A M, M D** Pearl River, N Y (6, 1916)
- Dale, H H** The Wellcome Trustees, Dilke House, Malet St, London, W C, England (3, 1926)
- Hektoen, Ludvig, M D** 629 S Wood St, Chicago, Ill *President, Chicago Tumor Institute* (6, 1919)
- Hitchens, Arthur P, M D** Public Building, Wilmington 33, Del *Health Commissioner, Wilmington* (6, 1913)
- Houssay, Bernardo A, M D** Viamonte 2790, Buenos Aires, Argentina *Director and Professor of Physiology* (1, 1942)
- Huntoon, F M, M D** Woodbridge, Conn (6, 1918)
- Lapicque, L** The Sorbonne, Laboratory of Physiology, Paris, France (1, 1946)
- Loewi, Otto, M D** New York University College of Medicine, 477 First Ave, New York City *Research Professor in Pharmacology* (3, 1941)
- McCoy, George Walter, M D** Louisiana State University Medical School, New Orleans *Director, Department of Public Health* (6, 1916)
- Novy, Frederick G, M D, Sc D** 721 Forest Ave, Ann Arbor, Mich *Dean Emeritus and Professor Emeritus of Bacteriology, University of Michigan Medical School* (6, 1920)
- Orbeli, L A** Academy of Sciences of the USSR, Moscow, USSR (1, 1946)
- Sherrington, Sir Charles S, Sc D, M D** "Broomside," Valley Road, Ipswich, England, *Former Waynefleete Professor of Physiology, Oxford University Former President of the Royal Society* (1, 1904)
- Sordelli, A** Department of Public Health, Institute of Bacteriology, Buenos Aires, Argentina *Director* (6, 1942)

RETIRED MEMBERS

- Addison, William H, M D** Univ of Pennsylvania, Philadelphia *Prof of Histology and Embryology* (1, 1928)
- Allen, William F, Ph D** Univ of Oregon Med School, Portland *Prof Emeritus of Anatomy* (1, 1929)
- Alvarez, Walter C, M D** Mayo Clinic, Rochester, Minn *Prof of Medicine, Mayo Foundation* (1, 1917, 3, 1921)
- Babkin, B P, M D, D Sc** McGill Univ, Montreal, Quebec, Canada *Prof of Physiology* (1, 1924)
- Bachmann, George, M D** Emory Univ School of Medicine, Emory University, Ga *Prof Emeritus of Physiology* (1, 1912)
- Benedict, Francis G, Ph D, M D** Machiasport, Maine (1, 1904, 2, 1906)
- Brown, Edgar D, Pharm D, M D** Paynesville, Minn *Assoc Prof Emeritus of Pharmacology* (1, 1907, 3, 1909)
- Burton-Opitz, Russell, Ph D** 218 Bridle Way, Palisades, N J *Attending Cardiologist, Lenox Hill Hospital, Attending Physician, Cumberland Hospital, Consulting Cardiologist, Englewood, North Hudson, Holy Name, and Hackensack Hospitals* (1, 1902, 3, 1919)
- Campbell, H Louise, Ph D** 900 Windsor Ave, Windsor, Conn (5, 1933)
- Chambers, Robert, Ph D** Marine Biological Lab, Woods Hole, Mass *Dir of Lab of Cellular Physiology, Research Prof Emeritus, N Y U* (1, 1932)
- Child, Charles M, Ph D** Stanford Univ, Stanford, Calif *Prof Emeritus, of Zoology Univ of Chicago* (1, 1923)
- Clark, Elliot R, M D** Univ of Pennsylvania, Philadelphia *Prof and Head of Dept of Anatomy* (1, 1919)
- Coca, Arthur F, M D** Pearl River, N Y *Med Dir* (4, 1924, 6, 1916)
- Cole, Rufus, M D, D Sc** Mount Kisco, N Y *Member Emeritus, Rockefeller Inst for Med Research* (6, 1917)
- Culler, Elmer A, Ph D** Univ of Rochester, Roch-

- ester, N Y *Prof of Psychology and Dir of Lab* (1, 1936)
- Dawson, Percy M, M D 665 E Maryland Ave, Claremont, Calif (1, 1900)
- Dooley, M S, M D Syracuse Univ College of Medicine Syracuse, N Y *Prof of Pharmacology* (3, 1923)
- Dochez, A Raymond, M D Presbyterian Hospital, 620 W 168th Street, N Y C *John E Borne Prof of Medicine and Surgical Research, Columbia Univ* (4, 1917, 6, 1922)
- Durrant, Edwin P, Ph D Ohio State Univ, Columbus *Assoc Prof Emeritus of Physiology* (1, 1928)
- Erlanger, Joseph, M D, Sc D Washington Univ School of Medicine, St Louis, Mo *Prof Emeritus of Physiology* (1, 1901)
- Famulener, Lemuel W, Ph D, M D 275 Engle St, Englewood, N J (6, 1920)
- Fitzgerald, Mabel P, 54 A George Sq, Edinburgh, Scotland (1, 1913)
- Forbes, Henry S M D Harvard Med School, Boston, Mass *Assoc in Neuropathology* (1, 1931)
- Githens, Thomas S, M D The Cambridge-Alden Park, Wissahickon and School Lane, Germantown, Philadelphia, Pa (1, 1915)
- Glaser, O C, Ph D Amherst College, Amherst, Mass *Prof Emeritus of Biology* (1, 1913)
- Hadley, Philip B, Ph D Western Pennsylvania Hospital, Inst of Pathology, Pittsburgh *Chief of Bacteriological Service and Research Bacteriologist* (4, 1927)
- Hale, Worth, M D Antrim, N H (1, 1908, 3, 1908)
- Halsey, John T, M D P O Box 264, Waveland, Miss *Prof Emeritus of Pharmacology Tulane Univ* (3, 1929)
- Herrick, C Judson, Ph D Univ of Chicago, Chicago, Ill *Prof Emeritus of Neurology* (1, 1907)
- Hober, Rudolf Univ of Pennsylvania Med School, Philadelphia *Visiting Prof of Physiology* (1, 1936)
- Hodgkins, R G, Ph D, M D 86 Varick Rd, Waban 68, Mass (1, 1911)
- Jackson, Dennis Emerson, Ph D, M D 114 Louis Ave, Cincinnati 20, Ohio (1, 1910, 3, 1912)
- Jobbing, James W, M D Columbia Univ, 630 W 168th St, New York City *Prof Emeritus of Pathology* (4, 1913)
- King, Jesse, Ph D Towson, Md (1, 1914)
- Knowlton, Frank P, M D Syracuse Univ College of Medicine, Syracuse, N Y *Prof Emeritus of Physiology* (1, 1911)
- Kyes, Preston, Sc D M D North Jan, Maine *Prof Emeritus* (6, 1918)
- Laurens, Henry D, Ph D, M D The Rockefeller Inst, New York City *Associate* (1, 1913)
- Lewis, Warren H, M D Wistar Inst of Anatomy and Biology, Philadelphia, Pa *Member* (1, 1919)
- Loebel, Robert O, M D 205 East 78th St, New York City (1, 1928)
- Mackenzie, George M, M D Mary Imogene Bassett Hospital, Cooperstown, N Y *Physician-in-Chief, Dir, Otsego County Lab* (6, 1912)
- MacPhillamy, Betty B, Ph D 145 Greene Ave, Madison, N J *Bacteriologist* (6, 1944)
- Moulton, C Robert, Ph D 5602 Dorchester Ave, Chicago, Ill (5, 1933)
- Parker, George H, Sc D 16 Berkeley St, Cambridge, Mass *Prof Emeritus of Zoology, Harvard Univ* (1, 1909)
- Pilcher, J Douglas, M D City Hospital, Scranton Rd, Cleveland, Ohio *Assoc Prof of Pediatrics, Western Reserve Univ School of Medicine* (3, 1911)
- Pohlman, Augustus G, M D Univ of Southern California, Los Angeles *Assoc Prof, Dept of Otolaryngology* (1, 1934)
- Pratt, Frederick H, M D Boston Univ School of Medicine, Boston, Mass *Prof Emeritus of Physiology* (1, 1919)
- Quinby, William C, M D Harvard Univ Med School, Boston, Mass *Clin Prof of Genito urinary Surgery* (1, 1916)
- Riddle, Oscar, Ph D Cold Spring Harbor, L I, N Y *Visiting Prof from the U S (in South America)* (1, 1919)
- Robertson, Oswald H, M D Univ of Chicago, Chicago, Ill *Prof of Medicine* (4, 1932)
- Rogers, Charles G, Ph D Oberlin College, Oberlin, Ohio *Prof of Comparative Physiology* (1, 1911)
- Roth, George B, M D 3814 T St N W, Washington D C *Prof Emeritus of Pharmacology, George Washington Univ* (1, 1914, 3, 1911)
- Sabin, Florence R, M D, Sc D 1333 E 10th Ave, Denver 3, Colo *Member Emeritus, Rockefeller Inst* (1, 1923)
- Sacks, Ernest, M D 97 Arundel Pl, St Louis, Mo *Prof Emeritus of Clin Neurological Surgery, Washington Univ Med School* (1, 1910)
- Sappington, Samuel W, M D, D Sc P O Box 528 Bryn Mawr, Pa *Prof of Pathology, Hahnemann Hospital* (6, 1913)
- Scamman, Richard E, Ph D 172 S E Bedford St, Minneapolis, Minn *Distinguished Service Prof in Grad School* (1, 1923)
- Schultz, W H, Ph D 3102 18th St, N W, Washington, D C *Prof Emeritus of Pharmacology, Univ of Maryland* (1, 1907, 3, 1909)
- Slonaker, James R, Ph D 334 Kingsley Ave, Palo Alto, Calif *Prof of Physiology, Leland Stanford Jr Univ* (1, 1917)
- Smith, Sybil L, A M 1421 44th St, N W, Washington, D C (5, 1940)

- Snyder, Charles D , Ph D 4709 Keswick Rd , Baltimore, Md *Prof Emeritus of Exper Physiology, Johns Hopkins Univ* (1, 1907)
- Sweet, J E , M D , Sc D Unadilla N Y *Prof Emeritus of Surgical Research, Cornell Univ Med College* (1, 1913)
- Walker, Ernest Linwood, Sc D 50 Winchester St , San Francisco, Calif (3, 1931)
- Weed, Lewis H , M D , Ph D Natl Research Council, 2101 Constitution Ave Washington, D C (1, 1919)
- Wood, Horatio C , Jr , M D , Ph M 319 S 41st St , Philadelphia 4, Pa *Prof of Pharmacology and Therapeutics, Univ of Pennsylvania, Prof of Materia Medica, Philadelphia College of Pharmacy and Science* (3, 1908)
- Wulzen, Rosalind, Ph D Oregon State College, Corvallis *Asst Prof of Zoology* (1, 1916)
- Yerkes, Robert M , Ph D Yale Labs of Primate Biology, New Haven Conn *Prof Emeritus of Psychobiology, Yale Univ* (1, 1904)

MEMBERS

- Abbot, Lynn D F , Ph D Med College of Virginia, Richmond 19 *Assoc Prof of Biochemistry* (2, 1948)
- Abramson, David I , M D Univ of Illinois, Dept of Medicine, Chicago 12 *Asst Clin Prof, Attending Physician, Hines Veterans Hospital* (1, 1937)
- Abramson, Harold A , M D 133 E 58th St , New York City *Asst Prof of Physiology, Columbia Univ College of Physicians and Surgeons* (1, 1930, 2, 1934)
- Abreu, Benedict E , Ph D , M D Pitman-Moore Co , Indianapolis, Ind *Pharmacologist, Research Dept* (3, 1941)
- Acheson, George H , M D Univ of Cincinnati College of Medicine, Cincinnati, Ohio *Prof of Pharmacology* (1, 1942, 3, 1945)
- Adams, Georgian, M A , D Sc U S Dept of Agriculture, Washington 25, D C *Sr Exper Station Admin* (5, 1946)
- Adams, John M , M D Univ of Minnesota, Dept of Pediatrics, W 205 Univ Hospital, Minneapolis *Assoc Prof of Pediatrics* (4, 1947)
- Adams, Mildred, Ph D Takamine Lab , Clifton, N J *Research Chemist* (2, 1934)
- Adams, R Charles, M S , M D Mayo Clinic, Rochester, Minn *Instr in Anesthesia, Mayo Foundation, Member of Mayo Clinic Staff, Section on Anesthesia* (3, 1942)
- Adams, W Lloyd, M D , Ph D U S Public Health Service Hosp , Lexington, Ky *Chief of E E N T Service and Personnel Physician* (3, 1942)
- Adams, Wright R , M D Univ of Chicago, Dept of Medicine, Chicago 37, Ill *Assoc Prof of Medicine* (1, 1946)
- Ades, Harlow Whiting, Ph D Box 731, Emory Univ , Ga (1, 1945)
- Adler, Harry F , Ph D , M D School of Aviation Medicine, Randolph AFB , Tex *Dir Med Sciences Div* (1, 1943)
- Adolph, Edward Frederick, Ph D Univ of Rochester School of Medicine and Dentistry, Rochester, N Y *Prof of Physiology* (1, 1921)
- Adolph, William H , Ph D Peiping Union Med College, Peiping, China *Prof of Biochemistry* (2, 1946, 5, 1934)
- Ahlquist, Raymond P , Ph D Univ of Georgia School of Medicine, Dept of Pharmacology, Augusta *Prof and Chairman of Dept of Pharmacology* (3, 1945)
- Albanese, Anthony A , Ph D St Luke's Convalescent Hospital, Nutrition Research Lab , King St , Greenwich, Conn *Chief of Nutritional Research* (2, 1944)
- Albaum, Harry G , Ph D Brooklyn College, Bedford Ave and Ave H, Brooklyn, N Y *Asst Prof of Biology* (2, 1947)
- Albert, A , Ph D , M D Mayo Foundation, Rochester, Minn *Research Assoc* (1, 1947)
- Albritton, Errett C , M D George Washington Univ Med School, 1339 H St , N W , Washington, D C *Prof and Head of Dept of Physiology* (1, 1933)
- Alden, Roland H , Ph D Univ of Tennessee, Div of Anatomy, Memphis 3 *Assoc Prof* 1, 1949)
- Alexander, Robert S , Ph D Western Reserve Univ School of Medicine, 2109 Adelbert Rd , Cleveland, Ohio *Instr in Physiology* (1, 1946)
- Algire, Glenn H , M D Natl Cancer Inst , Bethesda, Md *Sr Surgeon, USPHS* (4, 1945)
- Allan, Frank N , M D Lahey Clinic, 605 Commonwealth Ave , Boston, Mass *Exec Dir of the Med Dept* (4, 1930)
- Allen, Charles Robert, Ph D , M D Univ of Texas School of Medicine, Galveston *Assoc Prof of Anesthesiology* (1, 1943)
- Allen, Frank W , Ph D Univ of California, 1557 Life Science Building, Berkeley *Assoc Prof* (2, 1947)
- Allen, Frederick M , M D 1031 Fifth Ave , New York City *Prof of Medicine, Polyclinic Med School and Hospital* (1R, 1924, 4, prior to 1920)
- Allen, J Garrott, M D Univ of Chicago, Univ Clinics, Chicago, Ill *Instr in Surgery* (1, 1943)
- Allen, Lane, Ph D , M D Univ of Georgia School of Medicine, Univ Place, Augusta *Assoc Prof of Anatomy* (1, 1939)
- Allen, Shannon C , Ph D Cornell Univ Med School, Depts of Physiology and Pharmacology, 1300 York Ave , New York City *Research Assoc and Dir of Aviation Research Unit* (1, 1945)

- Allen, Thomas H , Ph D Columbia Univ College of Physicians and Surgeons, Dept of Physiology, 630 W 168th St, New York City 32 *Asst Prof of Physiology* (1, 1947)
- Allen, Willard M , M D Washington Univ School of Medicine, 630 S Kingshighway, St Louis, Mo *Prof of Obstetrics and Gynecology* (1, 1934)
- Alles, Gordon A , Ph D 770 S Arroyo Parkway, Pasadena, Calif *Lecturer in Pharmacology, Univ of California Med School, and Research Assoc in Biology, California Inst of Technology* (1, 1932, 3, 1941)
- Alling, Eric L , M D Univ of Rochester School of Medicine and Dentistry, Rochester 7, N Y *Assoc in Radiology* (4, 1947)
- Allison, James B , Ph D Rutgers Univ , New Brunswick, N J *Dir of Bureau of Biological Research, Prof of Physiology and Biochemistry* (2, 1946, 5, 1949)
- Almquist, Herman J , Ph D The Grange Co , Modesto, Calif *Dir of Research and Vice-Pres* (2, 1937, 5, 1937)
- Altschul, Aaron M , Ph D Southern Regional Research Lab , 2100 R E Lee Blvd , New Orleans, 19, La *Biochemist, U S Dept of Agriculture* (2, 1949)
